"The plan represents a new model for urban development, one that leverages the rich and proud heritage of the Times Square area to motivate public action and private investment."

- New York City Regional Business Council

In analyzing the politics of the 42nd Street Development Project this paper breaks from the major approaches to the study of urban development politics that dominated the field during the 1980s. In particular, the focus on interest group activity represents a rejection of Peterson's (1981) macro-level vision of a unitary interest in development, and the resulting portrait of development policymaking as essentially nonpolitical. While a range of scholars have correctly challenged Peterson's argument for overlooking real political conflict over development (see Stone and Saunders, 1987), his argument has nevertheless remained compelling as a concise economic explanation for observable patterns of development politics. Rather than rejecting Peterson's assumption of a unitary interest on the usual theoretical or empirical grounds, this paper suggests an alternative means of understanding the political pattern he describes. Specifically, this analysis reveals that the perception of a unitary interest (and the resulting nonpolitical policymaking) is itself a politically-constructed outcome of development politics. It is politics, not economics, that explains the perception of unitary support for development.

In formulating this argument the analysis presented here fits more closely with the regime studies that emerged in reaction to Peterson later in the decade (see, for example, Stone and Saunders, 1987; Stone, 1989). It also relies on the concept of an urban growth machine (Logan and Molotch, 1986), and more loosely on Mollenkopf's (1983) concept of the pro-growth coalition. But this analysis builds on these theoretical approaches as well. It focuses on the micro-level processes that contribute to the consolidation of a pro-growth coalition at the local level, rather than emphasizing how federal programs shape local action. The analysis views the growth machine as a constructed product of these processes rather than a coalition among business and the public sector that exists as a given, without regard to time and place. Finally, the analysis uncovers a pattern and logic to the coalition politics observable in contemporary urban development. In this sense it builds on the work of earlier regime studies, which seemed content to demonstrate the presence of meaningful political activity but fell short of identifying coherent and theoretically-sginificant patterns.

The Cultural Politics of Times Square Redevelopment

The 42nd Street Development Project is a publicly-sponsored plan to completely redevelop about 13 acres of prime Midtown land centered around 42nd Street and Times Square in Manhattan. As approved by the New York City Board of Estimate (BoE) in 1984 the project called for the construction of four giant office towers (with 4.1 million square feet of space) around the intersection of Broadway, 42nd Street, and 7th Avenue; an enormous two-million-square-foot wholesale merchandise mart and a 550-room hotel at 42nd Street and 8th Avenue; the renovation of the Times Square subway station; and the preservation and restoration of nine historic theaters along 41st, 42nd, and 43rd Streets between 7th and 8th Avenues.

In all, the amount of new construction is roughly equivalent in density to four Empire State Buildings. The plan is conceptually based on a transfer of development rights (or "air rights") from the low-rise mid-block theater sites to the avenue sites where the office towers, merchandise mart, and hotel will be built. In this way the mid-block scale is kept low, while the avenue developments can exceed the densities that would otherwise be allowed under city zoning laws. (The largest of the office towers would be more than double the city's maximum allowable floor-area-ratio [FAR].) The transfer of air rights is an increasingly common technique that joins historic preservation and new construction in lucrative urban development. It is thereby reshaping the culture of the contemporary built environment around restored landmark structures.

The price tag on the redevelopment project has been estimated at greater than $2.5 billion, making it the largest urban renewal project in state history. The project is publicly-assisted through the condemnation of land, and it is subsidized primarily through city tax breaks. While estimates of the value of these tax incentives vary, one economic analysis placed the dollar value as high as $4 billion over the next century (Neuwirth, 1991).

By all objective measures this project is first and foremost one of massive office construction. What makes the case particularly interesting, however, is that the focus of the public debate centered on the elements of historic preservation and the arts; that is, on the theater restorations, which would expand the city's stock of Broadway theaters by 20%. In the statements of politicians and planners, and particularly in the media coverage of the area (especially that of The New York Times, a corporation - after which the area was named - that has its headquarters on the border of the redevelopment area and has a distinct interest in the success of the project) the office development was justified simply as a means of providing the cross-subsidy necessary for the restoration and operation of the historic theaters (as well as the subway station improvements). This characterization of the project was symbolized by the oft-used phrase "the return of the Great White Way," a reference to the Times Sqaure theater district during the romanticized era of the early 20th century.

The significance of this catch-phrase derives from its relation to the dominant discourse on Times Square. The commonly-

accepted discourse defines Times Square as a symbol of urban decline in America, where crime, drugs, prostitution, and pornography are rampant and, perhaps most importantly, where the streets have been taken over by a menacing subculture of young minority males. Never mind that various street studies (CUNY, 1978; UDC, 1984) present a far more complex portrait of the area (as one of the nation's major tourist attractions and as the city's primary legitimate entertainment district for low-income patrons). Given the widely held perception of the street as a "ghetto street" (a perception supported by the media), a project striving to recreate the Great White Way would hold a particular political resonance. Indeed, this vision of a restored Great White Way was the key to the cultural politics surrounding the redvelopment plan.

Public Hearings and the Politics of Urban Space

There are a number of different levels on which to analyze the political contest over an urban space. A comprehensive analysis must recognize that urban spaces are continually redefined through an ongoing series of contests involving the actions of business interests, public sector actors, and the individuals and groups that constitute the most direct physical users of the space. Through an interactive process, elements of these three groups work to shape an urban space. Although it may sometimes appear that the interests of these three spheres converge and produce highly stable commercial or residential areas, this view is short-sighted. Even in the most stable areas, the dominant coalition of interests from the three spheres must constantly mobilize to resist efforts by new social groups, and state and business actors, to restructure the nature and use of the space.

For example, when certain public officials decide to locate unwanted facilities in a solid middle-class neighborhood - such as treatment plants for garbage or sewage, shelters for the homeless, for drug addicts, for the mentally ill, etc. - residents (and their local political representatives) may engage in not-in-my-backyard ("nimby") struggles to protect property values and prevent the introduction of disruptive social groups into the neighborhood. Lower-income residents of undervalued neighborhoods (and their representatives) may have to fight the efforts of business interests that attempt to initiate a process of gentrification and displacement (often with some state-sector support). And business and real estate interests must compete with the efforts of neighborhood preservation groups to restrict development opportunities in valuable CBD areas.

On closer examination it is apparent that urban spaces are stable only from the most static perspective. More accurately, they are subject to ongoing contests regarding their use and value. (Even an office district, whose character is held quite stable by a massive built environment of towers, is subject to change. This is apparent from recent conversions of older towers to residential use [see New York Times, August 2, 1992], or the integration of

restored historic districts, as tourist attractions, into office districts.) A review of the history and character of the Times Square/42nd Street area illustrates how it has evolved over time as a result of the ongoing contests among a variety of interests including the Broadway theater industry, the adult entertainment industry, real estate developers, sex and drug subcultures, city planners and elected officials, and a population of low-income minority users of the space.

Yet within the process of ongoing conflict over space a state-sponsored redevelopment plan, such as the one for 42nd Street, marks a relatively discrete event around which interests coalesce, organize, and come to the fore. In effect, the contest is transferred to a new level, one which ultimately involves public review, debate, and decision-making in relatively open legislative institutions. Because of the added degree of publicness the nature and emphasis of the debate can be expected to differ from that reflected in planning documents or routine media coverage of the area. And because of the institutional forum the expression of interests will be shaped by the organizational resources of various interested groups and by biases in the system. In any case, the process of legislative approval for a state-sponsored redevelopment project offers perhaps the most overt, focused, and simplified view of the contest over a space.

The Representation of Political Interests

In the case of the 42nd Street Development Project legislative approval was required from the New York City Board of Estimate, the body with primary authority over land use decisions at the time. The Board was made up of three citywide officials - the Mayor, the City Council President, and the Comptroller - with two votes each, and the five Borough Presidents with one vote each. (The Board of Estimate was later ruled unconstitutional on the grounds that it violated the principle of one man, one vote. Land use decisions were subsequently placed under the authority of the City Council.) The Board held a public hearing on the project in October 1984, and then heard additional testimony at the following meeting in November before taking the final vote. During the course of the hearings Board members heard testimony from nearly 200 witnesses, of which project supporters outnumbered opponents by two to one. The Board approved the project by a unanimous vote.

Table 1 provides a breakdown of the affiliations of all the witnesses who appeared to support or oppose the 42nd Street Project including those who testified and those who registered a position only, without providing oral testimony. This breakdown provides useful insight into the public contest over West 42nd Street. To begin with, the table verifies the existence of a solid pro-growth coalition made up of the business community and urban arts/culture organizations, with strong backing from public sector officials. State support was particularly strong from elected officials representing larger districts, and from officials in the

Notes: Representatives of the Broadway theater organizations designated to develop and operate theater sites in the 42nd Street project were included under the category of "Business Community: Project Development Team" rather than "Arts/Culture: Broadway Theater Industry", though they fit both categories. Based on the available documents it was not possible to classify seven witnesses who "appeared but did not speak" in terms of support or opposition; therefore, they were not included in this table.

bureaucratic/administrative apparatuses. Additional support came from a unanimous construction industry, from religious leaders with congregations in the area, and from a variety of social service organizations. Opposition to the project came almost entirely from an anti-growth "community coalition" made up of Clinton neighborhood residents and their local political representatives, together with a collection of business and property owners from the project area facing condemnation and displacement. By examining the public positions of the various active interest groups it is possible to develop a clearer understanding of the political conflict involved.

The Business Community

In terms of sheer numbers alone the business community formed the primary component of the pro-growth coalition, with some 50 witnesses appearing in support of the project (almost three-quarters of whom provided oral testimony). Among this group there were three broad categories of business representatives: The first and most numerous category included the designated developers of the 42nd Street project sites and their professional consultants, such as the architects and economists; together they constituted the development team. Among the project developers were real estate powerhouses such as George Klein, the politically well-connected president of Park Tower Realty, who was designated to build the four office towers. (In his book Mayor, Koch identified Klein as at the "top of my list of campaign contributors" for his mayoral and gubernatorial campaigns in 1981 and 1982.) Also appearing in support were Trammel Crow, the nation's foremost developer of merchandise marts (described by a fellow developer at the hearings as "one of the greatest figures in the 20th Century in the development business") who was designated to operate the mart on 8th Avenue; and Jerry Speyer, of the major development firm Tishman-Speyer that was selected to build the mart. Representatives of the Nederlander and Jujamcyn organizations, major owners and operators of Broadway theaters who were designated to develop and operate theater sites, also appeared, as did representatives of Housing Innovations/Planning Innovations, a minority-owned firm from Boston designated (as part of a consortium) to build and run the hotel. Corporate architects Philip Johnson and John Burgee also turned out to support the project and defend their much-maligned design for the monumental office towers.

The second category of witnesses from the business community included individual business and real estate owners and representatives of large corporations. For the most part, it appears that the owners who supported the project had a property or business located in the neighborhoods surrounding the project area and, therefore, stood to gain considerably from an increase in property values and upscale visitors. Corporate representatives appeared on behalf of Xerox and AT&T voicing great enthusiasm for

the potential of a high-tech trade mart where they could exhibit and market new computer technologies. While representatives from a number of major financial institutions also appeared in support, none gave oral testimony specifying the basis of their position.

The third category of business support came from business and real estate trade associations. The associations were organized on a variety of levels, from local groups representing businesses on 8th Avenue, 9th Avenue, and 42nd Street, to state and regional business and real estate associations. Considering the sheer number of businesses represented by these associations one gets a sense of the magnitude and weight of the political pressure emanating from the business community. For example, the president of the Real Estate Board of New York, whose organization represented more than 5,200 members from the real estate community, pointed out that "Rarely is there an issue [like the 42nd Street project] that the membership can unanimously endorse...[I]t is a first for the real estate industry, who have varied concepts of how development should be, to be supportive of one concept like this" (BoE, 1984; 274-5).

The associations, like the developers and the interested business people who appeared, all emphasized the economic benefits of the project - including jobs and tax revenues for the city and the growth of commercial real estate - and expressed their firm convictions that development would also lead to an improvement in the social conditions in and around the area. In this respect they adhered closely to the planning philosophy underlying the Environmental Impact Statement (UDC, 1984). This philosophy held that because of the severity of the social problems in the area only massive economic redevelopment would succeed in effecting a positive transformation.

A relatively small segment of the business community appeared to oppose the project. The opponents were owners of properties in the immediate project area who faced the condemnation and taking of their property for less than the full economic potential - as they saw it, with some justification - and business owners who feared dislocation without any assurance of adequate relocation assistance. (The Brandt Organization, which owned and operated seven theaters and a small office building in the project area, was one of the most determined opponents. Though no one testified on behalf of Brandt, their attorneys submitted a detailed letter of opposition to the BoE [Rubin, Baum, 1984]. In it they argued that Brandt had been excluded from participation in the project even though it had proposed a private redevelopment plan for its properties that would have saved the public millions of dollars. The letter suggested that the Brandt proposal was rejected because of political favoritism and unethical personal connections. More fundamental, though, is the fact that the Brandt plan challenged the assumption that only large-scale, state-sponsored intervention could stimulate revitalization.) In addition, some smaller businesses around the area also opposed the project for fear of dislocation caused by commercial gentrification; that is, by large increases in commercial rents due to rising property values and

taxes. Nevertheless, the considerable weight of the business community was solidly aligned in support of the project, and included some of the most powerful individuals and organizations in the city.

The Public Sector

More than forty witnesses at the BoE hearings held a public office of some sort or another. They included elected officials ranging from U.S. Senator to City Councilmember, and non-elected officials from the Chairman of the PDC to members of Community Boards. While two-thirds of the government witnesses supported the plan, the fact that more than a dozen witnesses from the state (i.e., government) sector opposed the state-sponsored plan requires some explanation. Essentially, the opposition came from the most local level community representatives, with the smallest districts, who were inherently part of the community coalition. These representatives included City Councilmembers, State Assemblymen and Senators, and a Congressman (Ted Weiss), all of whose electoral districts were largely comprised of the project area and/or the bordering areas of Clinton, the Garment District, the Theater District, or the Midtown Office District (see map/figure...) . Manhattan Community Boards 4 and 5, made up of appointed members representing Clinton and adjacent Midtown areas, also opposed the project. (One CB member supported the project despite the official stand of opposition.)

On the other hand, the elected officials who supported the project were those with large enough constituencies that they were insulated from the unanimous opposition of the nearby communities. Both of the state's U.S. Senators, Daniel Patrick Moynihan and Alphonse D'Amato, offered testimony in support of the project; and Governor Cuomo made an appearance that was considered highly unusual, both because of the historical rarity of such an appearance by a Governor and because of the personal rivalry between the Governor and Mayor Koch. Of course, Mayor Koch both testified and cast his two votes as a Board member in favor of the project. Even two former mayors, Abraham Beame and Robert Wagner, Sr., were summoned to support the cause. From the unanimous BoE vote it is clear that two other citywide officeholders, the Comptroller and the Council President, also supported the project, as did the five Borough Presidents, even though none of these officials were registered as witnesses in support. If these seven officials were added to the numbers in Table 1, the overwhelming dominance of state support would be even more evident.

It is also noteworthy that non-elected officials - with the exception of Community Board members and district leaders who have more local, representative roles - were heavily supportive of the project. Some of these officials appeared on behalf of state and city planning and economic development agencies (i.e., the UDC and the PDC) with narrow objectives and no direct representative role. Others testified on behalf of Metropolitan Transit Authority, the

New York City Departments of Transportation and Housing, the Mayor's Office of Midtown Enforcement, and the Police Department. All of these officials reiterated relevant aspects of the basic philosophical premises that were at the heart of the UDC's Environmental Impact Statement (that is, that the magnitude of the social and physical problems required comprehensive state-sponsored intervention; that the density of the office development was only sufficient to cover the cost of public improvements in the form of a restored theater district and a renovated subway station; and that the displaced social pathology of the area would not be replicated anywhere else). Clearly, an extensive city and state bureaucratic machinery was mobilized in support of the project.

Overall, the public sector formed an essential component of the pro-growth coalition. Higher-level elected officials and a mobilized bureaucracy combined to promote the redevelopment project. The only real state-sector opposition came from those elected officials and Community Board members whose districts were largely based in the immediately affected communities, and who were therefore most directly tied to the community coalition. Because of the overwhelming opposition within the nearby communities, these officials had little choice but to reflect the unanimity of sentiment and oppose the project.

The Urban Arts/Culture Community

While the business community and public officials are established components of the traditional urban growth machine (Logan and Molotch, 1986), the third major group supporting the project is a relatively new player in the arena of development politics. This component of the pro-growth coalition was formed by a variety of civic, professional, and business groups concerned with promoting the arts (especially Broadway theater), historic preservation, and urban planning and design objectives. The fact that more than 30 witnesses from these groups were present - making it the second largest category of supporters, outnumbered only by the business community - attests to their importance as part of the pro-growth coalition.

Eleven arts/culture organizations were joined together in a group called the President's Council in order to speak more effectively with one voice on planning issues such as the 42nd Street project (they had also been active on another issue of concern, the Midtown zoning revisions of the early 1980s). (The eleven members of the Council are the New York chapters of the American Institute of Architects, the American Planning Association, and the American Society of Landscape Architects; the Architectural League; the Cultural Assistance Center; the Municipal Art Society; the Landmarks Conservancy; the Parks Council; the Public Art Fund; the Regional Plan Association; and the Women's City Club of New York.) Because the city and state agencies behind the 42nd Street plan were essentially concerned with economic development objectives these arts/culture organizations felt that

there was a need for critical review and advice on issues of aesthetics and urban design, which the President's Council could provide. While the City Planning Commission (CPC) was officially responsible for evaluating issues of urban design, the CPC staff was not actively involved in the project, despite a prominent role played by its chairman, Herbert Sturz (Fainstein, 1985; 2). (One of the recommendations presented at the hearings by the President's Council was to make comprehensive Times Square planning a major focus of CPC efforts.)

In general, the President's Council and its member organizations supported the redevelopment project, but the witnesses were very critical of a number of its particular aspects. The criticisms focused on the enormous bulk and somber design of the four office towers (and the need for tighter legal restrictions on future development above the theaters or transfers of air rights from these sites); the lack of adequate provisions for the future operation of the theaters; the possible demolition of the historic Times Tower (an issue left for future determination by an advisory council yet to be named); and the overall lack of input afforded to the civic associations on planning and design issues. Their "essential conclusion" was that "the 42nd Street project is an unfinished proposal" (BoE, 1984; 252). Approval for the project should be granted in phases in order to ensure continued public input and oversight.

Indeed, when the heads of the member organizations of the Presidents' Council testified they were so critical of certain aspects of the plan, and so insistent that certain changes be made, that it was difficult to see their testimony as support for the project. The message they conveyed was one of opposition to the plan as presented, with support conditional on changes that would address aesthetic concerns. At the least, they called for a postponement of the final BoE vote pending a negotiation and resolution of the outstanding issues. Nevertheless, with the exception of one member-organization (the New York City Landmarks Conservancy) all of the members of the Presidents' Council went on record as supporters of the plan they criticized. Several unaffiliated architects also offered support as design professionals in spite of similar aesthetic criticisms that they made.

On the business side of the arts, the League of Broadway Theaters and Producers, and individual owners and producers, formed a solid bloc of support from the theater industry, with more than a dozen persons appearing on behalf of the project. (Two other organizations from the Broadway theater industry that were designated as developers and operators of theater sites in the project were counted as members of the business community/project development team in Table 1.) These witnesses supported the project as a means of eliminating the blight of the area and displacing the threatening sub-cultures that allegedly deter fearful suburbanites from attending Broadway theater. As the chairman of the Shubert Organization testified, legitimate theaters and the city as a whole "paid the price for a deteriorated 42nd

Street" because of its "notorious image which has inhibited tourism ... and menaces New York's stellar attraction, the legitimate theater" (BoE, 1984; 211-12) There was, however, a notable absence of representation at the hearings from the actors and stagehands affiliated with Broadway theater; the only speaker from among these groups - a set designer - opposed the project.

Additional support from the arts community came from representatives of several other cultural institutions and organizations. For example, Nat Leventhal, the President of Lincoln Center (and former Deputy Mayor under Ed Koch), emphasized the parallel between that project of high-cultural production, approved by the BoE nearly 30 years earlier in the face of similarly high costs to the local community, and the 42nd Street project. (According to Caro [1974; 1014], the Lincoln Center project involved the demolition of 7,000 units of low-income housing and the construction of 4,400 new dwelling units, 4,000 of which were luxury housing.) He encouraged Board members to be equally bold despite strong community opposition, since history had proved the value of such culturally-attuned development and would certainly do so again. He argued that: "Just as the creative proposal twenty-seven years ago to transfer a blighted West Side neighborhood into the world's foremost performing arts complex launched a renaissance in a large area of Manhattan, so will your proposal of the 42nd Street project in all likelihood have that result today" (BoE, 1984; 184-5). To prompt the Board members further, he added: "You may never have a better chance to strike a blow for civilization" (187). Indeed, Leventhal was quite astute in illuminating the similarities between the two projects; Lincoln Center stands as perhaps one of the earliest models of a major redevelopment project aimed at redefining space through arts-based cultural production - a model applied here in the case of the 42nd Street redevelopment plan.

Thus, despite some stinging criticism, a community of urban arts and culture organizations and professionals provided a solid bloc of support for the project. Although the project was not aesthetically refined enough for many in this category, the components of historic preservation and arts production were enough to secure its support. It is clear, however, from the unaddressed concerns and the complaints about the lack of input that the urban arts/culture community was a disadvantaged partner in the pro-growth coalition; no other partner expressed such detailed criticism of the final plan.

The Construction Industry

More than twenty witnesses from the construction industry appeared and provided enthusiastic support for the project. The witnesses included contractors, laborers, and representatives of the unions and building trades associations. The support from this group was unanimous and unequivocal; for the most part it was framed as an openly-stated desire for construction jobs. A

representative from the Carpenters' Union laid it on the line: "We candidly declare our self-interest in the construction of this good project ... which will represent a windfall of jobs to the 10,000 people in the construction industry ... [a level] not seen since the construction of the World Trade Center" (BoE, 1984; 276). The president of the New York State and New York City Building and Construction Trades Council was equally direct, declaring: "The building and construction trades, of course, are selfish in its interests in the jobs [the 42nd Street project] would create for our industry." He noted further that "Labor is in full support ... [and] to keep the peace here [at the hearing], we have another thousand [witnesses] downstairs we asked not to come up" (BoE, 1984; 217-19). The witness did make a point of mentioning the broad advantages of the plan as well, including the permanent jobs, tax revenues, and subway station improvements that would accrue to the benefit of the public at large. Indeed, the appeal for jobs was often supplemented with descriptions of Times Square as a "cancer" on the body of the city that had to be removed to restore its economic health.

Yet, as critics from the Clinton neighborhood pointed out, construction jobs could be created as easily through any other type of large-scale construction project sponsored by the state, such as low-income housing development. The jobs did not depend on the details of the plan, only on its magnitude. Moreover, residents accused the construction workers of residing outside of the city and having little interest in the long-term impact of the project. In any event, the emphasis on jobs suggested that support from the construction industry had little connection to the specifics of the project.

The Social Service Sector

A dozen witnesses appeared on behalf various social service organizations in support of the project. Several of the witnesses represented job training or other work programs and based their support on the need for the creation of construction jobs. Roughly half of the social service organizations provided aid to travelers, immigrants, victims, and the like, and operated out of offices located in the Times Square area. They were, therefore, closely tied to the tourist industry. The Travelers' Aid Services Program, for example, provides emergency assistance to "stranded travelers and tourists" and, therefore, chose its Times Square location because of "the attraction Times Square has for many tourists" as well as its central location (BoE, 1984; 382). Their testimony contained a certain paradoxical quality; that is, they supported the project because it would reconstruct a dangerous Times Square, yet they served the mass of tourists who were drawn to the area as it was.

Religious Leaders

Religious leaders, mostly with congregations in and around the Times Square area, provided the moral firepower for the redevelopment plan. As one clergyman presented the issue, the depravity of Times Square surpassed even biblical proportions:

> That the present conditions on 42nd Street even came into being and then proliferated is a heinous civic blot that makes Sodom and Gomorrah's offense seem mildly evil. I cannot believe there may be even one caring person who believes that such pervasively corrupting conditions should exist, conditions that consign human life in the Times Square and Clinton communities to such base levels that human beings have no value except as exploitable products, things to be used, bought and sold into a slavery of narcotics, and crime, and slime, and sleaze, in order to gratify the greed of merchants and property owners for whom human dignity is meaningless (BoE, 1984; 206-7).

To sit by passively and allow the conditions in Times Square to persist was, in effect, a crime against God and humanity that could not be tolerated. Consequently, a vote for the project represented the only morally-correct course of action.

This position reflected the choice among two options only, the 42nd Street project versus no action; it did not evaluate the 42nd Street plan against other possible courses of action aimed at addressing the social conditions of the area. Another clergyman, representing the bishop of the Greek Orthodox Archdiocese, summed up the available alternatives in this way: "If the price we must pay for ridding ourselves of that cesspool on 42nd Street is a line of office towers, I say so be it" (BoE, 1984; 222).

Still, a minority of the religious leaders opposed the plan on the grounds that it would contribute to housing problems and suffering among Clinton residents. For these leaders (including the Executive Director of Catholic Charities), it was essential to challenge all "public policies that directly or indirectly promote displacement or homelessness" (BoE, 1984; 296).

The Garment Industry

Several owners of garment manufacturing firms testified in favor of the project. In general, they anticipated positive benefits from the rejuvenation of the area at the northern boundary of the Garment District. On the other hand, the Federation of Apparel Manufacturers (FAM) - with 5,500 member firms employing some 150,000 workers - opposed the project, as did the International Ladies' Garment Workers Union (ILGWU). Despite their support for Times Square redevelopment both groups expressed grave concerns over the displacement of jobs and businesses that might result due to conversions of manufacturing spaces. As the FAM director put it:

> [W]e are pleased with the prospect that the 42nd Street redevelopment project will bring a needed rebirth to the entire Times Square area ... We also wish to caution you as seriously as we can not to consider these benefits at the expense of the New York garment industry and the price we will pay if you were to proceed ... without first creating indispensable legal instruments that will prevent such a mart from shattering the viability of many in the industry (BoE, 1984; 206).

FAM argued for expanded protection for the Garment District as a condition of approval for the project. Specifically, FAM wanted stricter limits on the conversion of manufacturing lofts to other uses, and additional restrictions on the apparel-related uses of the merchandise mart. An informal agreement had already been reached to convert the mart from primarily fashion to high-tech uses in response to studies showing adverse effects on the garment industry - including even the UDC's own data. (The author of one such study testified that there was no evidence supporting the need for an apparel mart, which, on the contrary, would lead to job losses and no increase in buyers for the industry.) Manufacturers would support the project only when extensive protections for the garment industry were made legally binding.

Still, opposition from FAM and ILGWU was highly specific. These groups did not oppose the redevelopment project in general. As the ILGWU representative testified, the group was not "strictly speaking" in opposition (BoE, 1984; 159); it simply wanted more protection for the garment industry. Indeed, with certain protections this industry would have joined the larger business community in support of the project. Until that point they would remain allied in opposition with those local businesses that were most immediately threatened by the project.

Clinton Residents

At the hearings, opposition to the project was concentrated in a virtually unanimous group of some 40 Clinton residents who registered positions. Many of these opponents identified themselves as members of a loose organization called the Clinton Coalition of Concern, but others did not state an affiliation. All spoke vehemently against the project on the grounds that it would lead to gentrification of the Clinton neighborhood and extensive displacement of its low- and moderate-income residents, while at the same time providing an unwarranted "give-away" to wealthy developers and big businesses. Residents described the project variously as "the most outrageous land graft in the history of New York City" (BoE, 1984; 230), "one of the most insane and criminal land grab deals of the world" (226), and so on. For the Clinton residents the conflict was therefore framed along class lines, and the project worked like traditional urban renewal by displacing the poor for the benefit of the wealthy (Fainstein, 1985; 1987). They

questioned why the developers did not "do it the American way ... as most real estate deals are made, by going out and acquiring the property in the marketplace rather than utilizing the force of law" (BoE, 1984; 323).

As those most directly exposed to the area, Clinton residents actually preferred the status quo to the project being presented for approval. Therefore, project sponsors simply added insult to injury when they defined the project as an effort to clean up Times Square for the benefit of city residents. Clinton residents regarded "the constant invocation by the project's supporters of the sleaziness of present street conditions as a coverup by which Clinton's original demands for neighborhood improvement [were] cynically used to justify a tax giveaway to real estate developers" (Fainstein, 1985; 7). One resident even suggested, perhaps hyperbolically, that the project was actually "designed to remove us from our homes under the guise of getting rid of pornography" (BoE, 1984; 229). There could be little doubt that a project of this scale would create enormous development pressures on the last low-income neighborhood in Midtown Manhattan.

The Politics of Times Square Redevelopment

The preceding survey of the interests represented and expressed at the public hearings on the 42nd Street project illustrates some important points about the nature of the political conflict. The analysis of interest group activity demonstrates that, at this level, the conflict pitted a strong pro-growth coalition against a localized community coalition with minimal organizational resources. The pro-growth coalition centered on a core triad of interests including the business community, the state sector, and a community of urban arts and culture associations and enterprises. These groups all shared a particular interest in the project as it was specifically formulated.

Additional support came from the construction industry, and an assortment of social service organizations and religious leaders. These groups formed a second level of support, since they had no direct interest in the specific project at hand; instead, they had a more general interest in any project that would create a large number of construction jobs or attempt to alter the social dynamic of the Times Square area. This is evident from the testimony given by these secondary groups, which exhibited little concern for the specifics of the project (and indicated no involvement in their formulation) and focused instead on the importance of taking some action. In contrast, the testimony from the core support groups dwelled heavily on the importance of particular project components, reflecting their direct interest in the formulation of project specifics. The objections from the arts and culture community indicated, however, that this sector was a relatively disadvantaged partner among the three core groups.

In fact, the considerable criticism of the project from the arts/culture community, made on aesthetic grounds, reflected the

fundamental line of division among the partners in the pro-growth coalition. The arts/culture groups largely shared a common concern that the project - with its emphasis on four giant, stodgy office towers and its lack of provisions for the future operation of the theaters - failed to go far enough in recreating the culture of a historic theater district. In part, the debate appeared to be one of economics versus aesthetics, and for the arts/culture community the project sacrificed the latter to the former. Brendan Gill, chairman of the Landmarks Conservancy, was among the most vocal opponents from the President's Council, and summed up the concerns among the civic groups when he stated (at the UDC hearings on the Environmental Impact Statement in the spring of 1984):

> We are concerned about losing Times Square as we know it: as a lively and dazzling entrance to the theater district. We have seen no evidence ... that the addition of four million square feet of conventionally dreary office space is necessary to achieve the stated goal of the project; on the contrary it will drastically affect the character of the area, not for the better but for the worse (quoted in Fainstein, 1985; 6).

Nevertheless, due to the elements of high culture included in the project the arts/culture community remained an important part of the pro-growth coalition. This community clearly supported the project out of its own self-interest; that is, it saw the preservation of the historic theater structures and the creation of new Broadway theaters as important achievements for the arts community. The aesthetic disagreement really focused on how, precisely, a new Times Square culture should be constructed.

Indeed, the pro-growth coalition was well-organized and powerful. The core groups included some of the most prominent individuals and corporations in the field of commercial real estate development, as well as the most dominant individuals and organizations in Broadway theater, and the most influential politicians in New York State. By the time of the BoE hearings these groups (particularly the business and state sectors) were connected by years of negotiations and cooperative planning. There were, of course, divisions within the business community, within the state sector, and within the arts community as to the desirability of the project; however, in each case the more powerful faction stood in support of the project. Within the business community only those with the most local investments in the project area (i.e., the existing business and property owners) opposed the project. On the other hand, nationally active real estate developers and corporations, and state and local business associations, supported the project.

Within the state sector the divisions of support and opposition operated along two axes: the first was based on district size, with opposition coming from the elected officials and Community Board members with districts smaller than the borough level that centered on the immediately surrounding neighborhoods.

These politicians had little leeway for action given the unanimity of opposition among neighborhood residents. The more powerful elected officials with larger districts and broader constituencies overwhelmingly supported the project. The second axis of division revolved around the distinction between elected and non-elected officials; the predominant support of non-elected officials (with the exception of those with local representative roles, more political than bureaucratic/administrative) reflected a mobilized bureaucracy pursuing the development agenda of the most powerful city and state political actors.

The Broadway theater industry was divided as well, though the division is barely discernable from the pattern of witnesses at the BoE hearings. While only one stagehand appeared and spoke against the project (arguing that Times Square would become Dallas, Houston, or Los Angeles), the fact is that the Actors' Equity Association (representing some 35,000 actors and stage managers) and its organizational offshoot dedicated to theater preservation, Save the Theaters, Inc., "jointly withheld approval of the plan" (Goldstein, 1985; 23). These groups had become bitterly skeptical of city planners and their appreciation for the theater district after the city allowed the demolition of two historic Broadway theaters (the Helen Hayes and the Morosco) in 1982 to make way for the construction of John Portman's long-awaited Times Square Marriott Hotel. It seemed that the city had been launching a development assault on West Midtown - which included among other things the massive Westway highway project, the convention center, and the new high-density zoning district - that showed utter disregard for the viability of the theater district.

The 42nd Street project failed further to recognize the interests of the theater industry by neglecting to provide landmarks designations for the 42nd Street theaters or to provide for their future operation; by threatening to dislocate theater-related businesses; by threatening to disperse a criminal population into the streets of the theater district; and by imposing an office-tower aesthetic in "near-total ignorance of the area in which [the towers] are to be built" (Goldstein, 1985; 24). In essence, Actors' Equity and Save the Theaters felt that "although not asked to help develop the policy for the project the theatrical community was invited to ornament it" in an effort to "legitimize the plan" (Goldstein, 1985; 24).

Despite their lack of support actors and stagehands were virtually invisible at the BoE public hearings and constituted a weak source of opposition. On the other hand, a vocal bloc of Broadway theater owners and producers, constituting a more dominant economic interest group, formed an important component of the pro-growth triad of interests. So, as with the divisions within the business community and the state sector, the more powerful segment of the theater industry firmly supported the 42nd Street project.

This suggests perhaps a necessary condition for successful redevelopment; namely, that the dominant interests behind each of the various public and private sectors must support the project. While it may be unrealistic to expect empirical support for a

unitary interest in development, this situation is approximated closely enough when there is a predominance of support from business, public officials, and culture organizations.

In sharp contrast to the powerful pro-growth coalition, the community coalition primarily consisted of individuals from the Clinton neighborhood with few resources and little organizational backing. Most of the opponents who listed an organizational affiliation appeared as members of the Clinton Coalition, a neighborhood organization active on housing and related issues. Other witnesses appeared simply as individuals reiterating the general neighborhood position. What is most notable about the opposition, therefore, is how localized and limited it was. There simply was no broad-based citizen opposition expressed, nor any opposition from a significant citywide organization.

Virtually the only resources of any significance for local opponents came from their grip on local political representatives. Although these were not the most powerful city or state political figures, they were a vocal and united bloc (that included Congressman Ted Weiss), and therefore a source of valuable support for Clinton residents. There was a widespread feeling among community activists, Community Board members, and other observers that the public had been excluded from the planning process from the inception of the project through the BoE hearings, in spite of repeated calls for participation (Brendle, 1985, 25; Neuwirth, 1985, 27; Fainstein, 1985, 5). After the first BoE hearing date, however, public officials began to make an effort to respond to neighborhood concerns. And, as Fainstein argues, "The key intermediaries in translating outside pressure into concessions were the elected officials rather than the planners, who until this point had remained obdurate" (1985; 5).

In fact, the concessions came directly from the elected officials, and really involved no modification of the 42nd Street project as formulated by the planners. Shortly before the second hearing date Governor Cuomo and Mayor Koch announced that they would provide $25 million in city and state funds for low- and moderate-income housing projects in the Clinton neighborhood, as well as other community services. Most local residents and officials felt that the housing money should come from the developers who were receiving generous public subsidies rather than from the public coffers that must serve all city residents; indeed, this was the principal point of conflict in last-minute negotiations among local legislators, representatives of Community Board 4, and the staffs of the Mayor, the Governor, and the BoE (Brendle, 1985; 26). But in the end the concession came from the state sector, not from the business interests. Still, it is unlikely that there would have been any concessions at all without the efforts of a united bloc of local political representatives. It seems that this group played a mediating role between the pro-growth coalition and neighborhood interests.

Non-interests and Non-decisions in the Legislative Arena

While the data on the witnesses at the BoE hearings says much about the political conflict surrounding the 42nd Street project, it provides an incomplete picture of the conflict of interests. The inherently distributional nature of land-use decision making renders it a quintessentially political sphere. Publicly articulated interests do not necessarily exhaust the full range of interests gaining or losing from a land-use decision. Other interests can and must be deduced from patterns of actual public use of a space, from the sources of redevelopment initiatives, and so forth. The data on witnesses must therefore be examined as much for the interests it does not reveal as for those that it does.

For example, we know from the UDC's Environmental Impact Statement (1984), from the CUNY street studies (1978), and from simple observation that the Times Square area was the city's primary low-income entertainment district. Based on the street studies, the number of low-income residents who used the area for legitimate entertainment purposes may have even rivaled or surpassed the entire group of about 50,000 Clinton residents. Clearly, the loss of such a unique and important resource for so large a group constitutes a significant distributional impact.

Yet, whereas more than 40 witnesses turned out from the Clinton community to oppose the project, only one unaffiliated witness spoke on behalf of the city's low-income minority population that stood to lose an easily-accessible, centrally-located district of cheap fast food outlets and discount first-run movie houses. (Street studies during the late 1970s indicated that the cheap action movies, and not the adult establishments, were the most heavily patronized entertainment facilities in the area [Winnick, 1978].) He pointed out that "There is no way for the people who are coming to 42nd Street ... [who] only have minimum money ... to pay the forty and forty-five dollars that it takes to go into a legitimate theater" (BoE, 1984; 326-7). Regarding this low-income minority group, he noted: "I have heard about nothing about what their pleasures are and what is going to exist for them" (327).

The under-representation of area patrons can be explained more convincingly by Olson's (1965) logic of collective action than by the disavowal of any legitimate political interest among this group of Times Square patrons. The group is unmanageably large and diffuse, made up of individuals who by definition have few economic resources, and have largely non-economic and intangible interests (i.e., that of leisure entertainment) in the area. By way of contrast, Clinton residents, though a very large group, perceived a vital economic interest in defending their housing. Of course, it is also essential to note that the low-income population of Times Square had already been identified in the public debate as a source of the area's decline.

Given the economic value of the adult entertainment industry one might also expect considerable opposition from the owners and clients of sex-related establishments in the area. The failure of these interests to mobilize publicly reflects more about the dubious neutrality of the "black box" imagined at the center of the

pluralist process than problems of collective action. The industries of sex-related entertainment, legal and illegal alike, were already publicly vilified as both symbol and source of decay in the area; indeed, a central stated objective of the entire 42nd Street project was the clean-up of these activities. As a result there was little to be gained for the legal sex-entertainment industry from mobilizing as an interest group in the public arena, despite its vast economic resources; in this arena it was already denied the status of a legitimate participant. Rather, it seems that the adult entertainment industry must compete for urban space through the raw power of the purse alone; in other words, it is the highest bidder, paying top dollar rents to commercial landlords with undervalued properties in advantageous locations.

In sum, it hardly seems a coincidence that the two groups most notably absent from the hearings were already labeled as culprits for the area's demise in the dominant political/cultural discourse on Times Square. Regardless of its veracity, this discourse - as defined by politicians, investors, planners, and the press - played an important role in structuring the political conflict and the relative status of various interests. By denying legitimate interests to the low-income patrons of cheap action movies and fast food outlets, and to the adult entertainment industry, supporters contributed to the perception of unanimous support for the redevopment project.

Aside from these unrepresented opponents of the project there were also a number of major institutions in the city with a substantial economic interest in the completion of the project which failed to appear in support at the hearings. Among these institutions were the New York Times and the Ford Foundation (located on East 42nd Street), as well as corporations such as NBC and AMEX. While one may question whether these institutions had a real concrete interest in the project, the fact is that they had previously provided funding and organizational support for street studies and/or proposals for the revitalization of the area. Representatives of NBC, AMEX, Salomon Brothers, the Dreyfus Corporation, and other corporations and law firms were members of the board of The City at 42nd Street, Inc., the non-governmental organization whose plan for the redevelopment of 42nd Street grew out of efforts by the Ford Foundation and provided the prototype for the state-sponsored plan considered by the BoE (The City at 42nd Street, Inc., 1981). Nevertheless, none of these organizations attended the hearings in order to support the final proposal. Even those representatives of major financial institutions that did appear (e.g., those from Chemical Bank, American Savings Bank, and Goldman, Sachs & Co.) did not provide oral testimony indicating the basis for their support. In this way they limited their publicly-stated interest in, and connection to, the project.

It is not entirely clear why organizations that expended resources to promote a redevelopment project would fail to appear publicly on its behalf. Suffice it to say that these organizations have alternative methods of pursuing their interests; that is, they

are not required to submit to the workings of a "black box" along with everyone else. By providing funding for studies, formulating proposals, and serving on the boards of non-profit development corporations these institutions can ensure that their interests are accommodated early in the process. They possess the resources that enable them to initiate action aimed at achieving their objectives; thus, they obviate the need for participation at such a late stage in the process, when final public approval for the project is decided. Major institutions can establish the choices that form the basis of an unfolding decision tree, which finally culminates in the simple yes or no decision made in a public legislative body. In effect, these institutions enjoy the power to set the agenda on such development issues (Bachrach and Baratz, 1962?).

In sum, the BoE hearings on the 42nd Street Redevelopment Project illustrate a number of problems with the articulation and recognition of interests in a pluralistic, public decision-making process. For large groups with limited resources and less tangible interests, the obstacles to collective action may prove insurmountable; for other groups, the system may have already denied them the legitimate status required for participation as a player; and for some, they possess sufficient resources to initiate and define the alternatives from the start.

In fact, an important deficiency of traditional pluralist theory evident in the Times Square case is its failure to recognize the sequential nature of public decision making, and the fact that some players enter into the process much earlier than others. Pluralism assumes that interest articulation occurs more or less simultaneously for all players, and can then be metamorphosed into a compromise outcome. As the Times Square case demonstrates, however, power comes into play by determining the point at which one can enter into the process and attempt to shape the further sequence of alternatives. The foundation of the 42nd Street plan began with the initiatives from the business community (culminating in The City at 42nd Street proposal); then, when state approval and backing were needed public officials and planners worked within the contours of this plan and modified it to suit public and private objectives more truly.

At the BoE hearings the arts/culture organizations, and especially the Clinton residents and their representatives, all spoke about their exclusion from the planning process despite repeated requests for participation. The relative weakness of the Clinton residents in particular was apparent from the fact that they had to rely on this public forum to make appeals for changes in the project, at a time when the alternatives were essentially reduced to a yes or no on the plan as presented. For all the purposes that such hearings might serve, they are a poor forum for negotiating changes in a project.

The attention to the concerns of Clinton residents that came at the BoE hearings did contribute to the establishment of a community housing fund, but this money represented less a change in the plan than compensation for its detrimental impacts. In the end, there was something pitiable about the emotional Clinton

residents who stood at the podium pleading for attention to their plight from BoE officials who had long since left the hearing in the hands of their proxies. The signal being sent was that the decision was a foregone conclusion. The fact that the Clinton residents had to rely on the BoE hearings for an opportunity to influence the project was a simple indication that they were really lacking the resources needed to shape the project at an earlier stage in the planning process.

When the Board voted unanimously to approve the project it seemed that the outcome had been predetermined. Despite two days of hearings at which the project's merits were contested and debated, the project still represented years of planning and cooperation among the state and private sectors. The BoE vote understandably reflected the active state involvement in the project, the support from major elements of the business and arts/culture communities, and the lack of any broad-based public opposition. In this sense, the Board's action was a reasonable reflection of societal interests. On the other hand it can be argued that the BoE hearings were hardly part of the decision-making process at all, since all the essential decisions relating to the project had already been made during the planning process. The BoE decision was reduced to a yes or no, effectively precluding public debate over alternative plans for the area. In this sense, the BoE hearing served more as a legitimating event than a decision making one.

Board Politics

The comments made by Board members during the roll-call vote indicate some important points about the nature of the project and conditions for its approval. The Assistant to the Mayor reiterated the compromise proposal offered by the Mayor and the Governor to provide $25 million to the Clinton community for housing assistance. The Council President and the Manhattan Borough President also applauded this plan, which they felt provided the necessary protection for Clinton residents and enabled them to support the project. It seemed irrelevant that Clinton residents and representatives continued to oppose the project on the second hearing date, even after the announcement of the $25 million community fund.

The Manhattan President and the Council President also asked for final assurances that the modified resolution would preclude the possibility of future air rights transfers or the demolition of historic theaters in the project area. As noted previously, UDC involvement meant that the project was not bound by the New York City zoning code, and therefore the air rights transfers were technically irrelevant (though, conceptually, the project transfers bulk from mid-block theater sites to the corner sites of the office towers). Land use determinations were made by the UDC according to the authorization set forth in the BoE resolution. For the theater sites as well as the other sites, any proposed major changes - such

as the demolition of theaters - would seem to require the approval of both the UDC and the BoE.

Nevertheless, the components of the project relating to historic preservation (including the concept of air rights transfers to other sites), and the creation of a theater/arts district, were central to the political support for the project. As the comments of the city officials indicated, there was some tension regarding the degree of commitment among project planners to the cultural project of reproducing the historic theater district. City officials remained actively concerned about these issues up to the last minute, and demanded assurances that the UDC would not be able to deviate from their intent. As a result, the resolution was amended to require only theater uses for specified sites, and to prevent building additions above theater structures or the transfer of air rights for the 99-year term of the UDC lease. The fact that these modifications were made in spite of their legal redundancy (according to the city's Corporation Counsel [BoE, 1984b; 3]) attests to the political saliency of the arts and preservation issues.

Redefining the Politics of Urban Development

This analysis of the political contest and contestants - both revealed and unrevealed - at the BoE hearings on the 42nd Street project illustrates some fundamental points about the new politics of urban development. To begin with, it is no longer sufficient to conceive of pro-growth coalitions simply as alliances among elements of the business community and the public sector. Rather, it is necessary to recognize that, in a meaningful way, a community of urban arts/culture groups - including design professionals, preservationists, and arts businesses - has become a central component in the paradigm of an urban "growth machine." While Whitt (1987) noted this change in the 1980s, it has remained to be shown how and why this new pattern exists. As the Times Square case demonstrates, the incorporation of this arts/culture community has significantly altered the nature of political conflict and debate surrounding urban redevelopment.

The arts/culture community has been drawn into the urban growth machine by the inclusion of preservation- and arts-based components, which clearly advance their causes, in development projects (Green, 1982). The practical effect of this is that even though aesthetic debates are not eliminated from development politics they are essentially confined to being debates among project supporters, rather than being a source of conflict between supporters and opponents. In other words, aesthetic objections do not serve as mobilizing issues for an anti-growth opposition. This is clearly evident in the Times Square case, where aesthetic issues were a major focus of the public debate, but never really threatened to derail the project because the debate was largely contained within the pro-growth coalition.

Furthermore, the arts/culture community is especially

important because it speaks for a much larger constituency of higher-income, better-educated urban residents. The objective of using redevelopment to culturally redefine (and thereby reclaim) space can, therefore, be elevated to a new role in the political debate where preservation- and arts-based cultural production is involved. That is, cultural redefinition is made central and explicit in an effort to generate support from higher-income residents. Simply put, high culture can be offered as an alternative to threatening minority urban subcultures (or to any undervalued space in the form of a blue-collar neighborhood, an outdated manufacturing district, etc.).

By framing redevelopment in this way the growth machine can take control of the environmental debate. In development politics, there are frequently environmental concerns - such as air quality, endangered species, water and soil contamination, etc. - that threaten to pit the better-educated, higher-income urban residents against the growth machine. By introducing preservation and the arts into development projects, as alternatives to social and physical decay, the environmental debate is recast along social and aesthetic lines. In other words, the environment is defined as a social rather than a biological system, and what becomes relevant in development politics is the focus on improving the social environment rather than protecting the biological environment. The effect is a realignment among environmentally-concerned segments of the public, as the higher-income, politically-efficacious constituency is relocated, by the nature of the debate, from the anti-growth to the pro-growth side.

This phenomenon is clearly evident in the politics of Times Square redevelopment. In this case the debate was defined as the construction of a historic theater district versus the continued dominance of crime, drugs, and pornography; in other words, the environment was defined in social and aesthetic, rather than biological, terms. In a city chronically afoul of the Clean Air Act there was remarkably little concern over the impact on air quality due to the increased traffic congestion that would inevitably accompany four million square feet of new office space. Several witnesses (including a traffic consultant) argued that the EIS seriously underestimated the adverse effects of the project on air quality, but the issue never became politically salient. Even The Clean Air Campaign - a citizens group active on planning issues that had fought and defeated the Westway highway project - was nowhere to be found on the 42nd Street project. In fact, the environmental debate had already been defined on social terms and, as evidenced by the lack of broad citizen-based opposition, the attentive public was solidly behind the social and cultural project of theater restoration.

Conclusion

This analysis suggests several important considerations related to ongoing debates in urban research. To begin with, there

was no unitary interest behind the 42nd Street Project in a literal sense. There was opposition not only from unanimous local residents, but also from members of the business community and the public sector, groups that are usually assumed to be unified growth supporters. As earlier regime studies demonstrated, there was meaningful political conflict surrounding the project.

From another perspective, however, the overwhelming predominance of support, aside from highly localized opposition, might reasonably approximate the kind of broad-based support for development described by Peterson. Nevertheless, this study does more than just add to a definitional endgame. It demonstrates that the overwhelming support for the project did not simply result from the abstract operation of an economic imperative. Rather, support was politically constructed according to a coalition strategy centered on cultural politics. In sum, the Times Square case suggests that the new pattern of urban development, involving preservation- and arts-based cultural production, deflects opposition by incorporating the arts/culture community into the growth machine and recasting the political/environmental debate in a way that predisposes higher-income urban residents to support redevelopment.

DIALOGUES OF TOLERATION: ERASMUS AND BODIN

INTRODUCTION

There is no necessary link between dialogue and toleration. First, not all defenders of toleration value dialogue. Mystics and spiritualists, for example, justify toleration on the ground that truth is internal and cannot be forced. But because they view truth as a matter of the spirit, not reason, they eschew dialogue. As one Dutch Anabaptist states: "The Christian faith is not a word pronounced by the mouth, but a true eternal force, a divine operation . . . which no one can know but he who receives it. It does not consist . . . in words outwardly pronounced, but in the experience of the living, true, just and eternal God and his Christ."[1] Second, not all dialogues are tolerant. Some are didactic, where the speaker possessing knowledge instructs his unenlightened interlocutor. For example, Thomas More's Dialogue Concerning Heresies is not an investigative dialogue between peers, but a didactic, authoritarian dialogue between More, who knows the truth, and the messenger, a youth in danger of being lost to the Lutheran heresy, who is ignorant of the truth. In this case, dialogue becomes More's vehicle to reclaim the youth. There is no toleration of heterodoxy here, no question that anything besides More's opinion is legitimate.[2]

Nevertheless, although dialogue and toleration **can** be distinct, there has been, in fact, a long-standing connection between the two concepts. Thus, while dialogue is not significant to all arguments for toleration, it remains central to the most famous defenses of toleration, like John Milton's Areopagitica (1644) and John Stuart Mill's On Liberty (1859). For both Milton and Mill, toleration promotes discussion, which, they believe, will lead to the discovery of more truths. The same nexus between toleration and dialogue is found in the U.S. Supreme Court's "marketplace of ideas" theory, which assumes that free speech should be protected because truth will emerge from the free interchange of ideas.

Dialogue has also traditionally been defined as tolerant. For example, Socrates' claims of ignorance, in contrast to More's profession of knowledge, suggests that his dialogue's conclusion has not been predetermined and that interlocutors in the Socratic conversations are truly free to express their opinions. And Cicero explicitly defends, in his dialogues, the liberty of speakers to state their opinions and to form their own judgments. "But let everyone defend his views," Cicero writes in the Tusculan Disputations, "for judgment is free: I shall cling to my rule and without being tied to the laws of any single school of thought which I feel bound to obey." Similarly, he writes in the same dialogue: "you must use your own judgment; if you are content with yourself in approving the right, then you will not only win a victory over self . . . but over the world of men and things."[3] Alluding to the tolerant nature of the Socratic and Ciceronian dialogues, Rudolf Hirzel argues in his classic Der Dialog that real dialogue, like that found in democratic Athens, presupposes freedom of thought and speech.[4]

The relationship between dialogue and toleration is the focus of this paper. I examine here how two different thinkers in the sixteenth-century, Desiderius Erasmus (1466-1536) and Jean Bodin (1530-1596), develop theories of religious toleration based on the model of dialogue. While both view dialogue as a model for toleration, I argue that each presents a different version of dialogue from which he derives a separate theory of toleration. In the section on Erasmus, I discuss Erasmus's "tolerant" dialogue, which is best exemplified by De libero arbitrio, diatribe sive collatio (On Free Will: A Disputation or Comparison), a one-

sided conversation with (and refutation of) Martin Luther, published in 1524. Erasmus offers in De libero arbitrio a traditional conception of dialogue, in which the speakers are engaged in a common search for the truth. I show that Erasmus looks backward to Cicero in developing his conception of dialogue. Erasmus, however, also anticipates Milton and Mill's case for toleration, which deems toleration a means to truth. The expression of opposing opinions, for Erasmus, allows the listener to compare viewpoints and to decide which is the most probable. Like the present-day "marketplace of ideas" approach, the Erasmian dialogue requires that the speakers adopt a certain degree of skepticism.[5] Although the interlocutors have their own opinions and argue for them, each speaker must entertain the possibility that he may be mistaken and, consequently, that he may ultimately adopt another position. Lacking certainty, the speakers in the Erasmian dialogue must tolerate other views. They must also respect each other because, Erasmus argues, civility promotes the discovery of truth.

In the section on Bodin, I argue that Bodin puts forward an alternative version of the tolerant dialogue in the Colloquium heptaplomeres de rerum sublimium arcanis abditis (Colloquium of the Seven about Secrets of the Sublime), which was completed in 1588, but circulated in manuscript form until the first complete printed edition was published in 1857.[6] Like the Erasmian dialogue, this dialogue between representatives of seven different religions is open: speakers are permitted to state their opinions and to decide for themselves. In fact, Bodin's dialogue is less restricted than any of Erasmus's because, in contrast to Erasmus's dialogues, the Colloquium includes non-Christian speakers, who are presented as every bit the equal of the Christian participants. But while diversity of opinions is found in both forms of dialogue, the speakers' goal--and the dialogue's--differ. In the Erasmian dialogue, or the Socratic and Ciceronian for that matter, the goal is to work together to find the truth, or at least to move closer to it.[7] Implicit in this vision of dialogue are the assumptions that (1) there is a single truth and that (2) the greater the consensus, the more successful the dialogue. In the Colloquium, however, these assumptions are rejected. The speakers do not pursue a single, common truth. Rather, they offer up their particular versions of the truth, unwilling to change their own positions.

From the perspective of the first dialogue, Bodin's Colloquium is a failure; the speakers do not even try to agree. But I argue that Bodin's dialogue is successful when judged on its own terms. The speakers do not agree on the truth, the Colloquium suggests, because truth--especially religious truth--is complex, and each speaker represents a different facet of that multifaceted truth. And though the speakers remain firm in their initial convictions, they gain from the dialogue a clearer perception of their own opinions. By comparing their views with one another, the speakers come to better understand their own truths, the sum of which constitutes the whole truth.

The difference between these two forms of dialogue has practical implications for toleration. A traditional dialogue like Erasmus's, with its monistic conception of truth, is exclusive. It presumes that if x is true, then y must be false. And it only tolerates in areas that are not yet known. Thus Milton, the oft-presumed herald of contemporary freedom of speech and press,[8] would have banned Catholicism because it conflicted with "known" truths.[9] As long as truth is in doubt, according to Milton, debate must be permitted: "To be still searching what we know not, by what we know, still closing up truth to truth as we

find it . . . this is the golden rule in Theology."[10] But, Milton reasons, we can know that Scripture is absolutely and solely authoritative, and because Roman Catholicism denies this proposition, it should be proscribed. Regardless of whether the opinion in question is Protestantism or liberal democracy, however, the message implicit in the first kind of dialogue is that once a conviction is held with certainty, there is no reason to tolerate competing ideas. Because dialogue aims at truth, then dialogue and diversity's raison d'être ceases when truth is known. By contrast, Bodin's dialogue accepts a pluralistic conception of truth. It notes that simply because x is true, does not mean that y cannot also be true. Therefore, this second type of dialogue can tolerate contradictory opinions, even when the opposing sides are convinced of their own truth. Truth, in the Colloquium, is not a monopoly maintained by force, but a shared commodity divided between different, mutually tolerant persuasions.

ERASMUS

Humanism, Dialogue, and Skepticism

Desiderius Erasmus was born in Holland, the illegitimate son of a priest. He rose during his lifetime to become a celebrity of international stature based on his far-ranging scholarship in biblical, classical, and theological studies. And to this day, Erasmus is the best known humanist of the sixteenth-century.[11] His reputation as "prince of the humanists" is rightly deserved. His vast corpus bespeaks an intense interest in the endeavors and studies characteristic of the Renaissance revival of the studia humanitatis known as humanism.[12] But above all, Erasmus demonstrates the humanist's concern with rhetoric, the most distinctively humanistic area of study.[13] All Erasmus's writings, including those not specifically devoted to rhetoric, are composed with an eye to their persuasiveness. It is with this attention to oratory that he writes of himself: "Erasmus taught nothing except eloquence."[14]

An important rhetorical tool for Erasmus was dialogue, a common genus during the Renaissance. The Quattrocento humanists had favored dialogue as a literary genre, and Erasmus followed their example.[15] There is an important difference, however, between the dialogues of Erasmus's predecessors and Erasmus's own. The Quattrocento humanists' dialogues did not generally concern religious issues. The Reformation had not yet brought doctrinal matters to the fore. But Erasmus did make use of the dialogue to deal with religious issues, especially after the Reformation had begun.

Erasmus did not discuss all religious issues in dialogue form. He reserved the religious dialogue for nonessential doctrines. For Erasmus, the fundamentals of faith could not be discussed. These doctrines that were essential to salvation had to be accepted without question. Nonessential doctrines, however, were not obligatory and could be questioned.[16] These nonessentials were adiaphoral, literally "things that make no difference."[17] Therefore, dialogue could be applied to them. As long as the speakers could agree on the fundamentals of faith, they were permitted to disagree on other beliefs. Erasmus makes this point in Inquisitio de fide ("An Examination Concerning Faith"). In this colloquy between a Catholic and a Lutheran, the Catholic discovers that the Lutheran, though reputed to be a heretic, adheres to the doctrines of the Apostle's Creed and is, therefore, orthodox. Erasmus

suggests through this dialogue that Catholic and Lutheran can retain their beliefs and discuss their differences because the two only differ on nonessentials.

When the issues debated are not essential to salvation, the speakers may adopt a skeptical attitude toward their own beliefs. In the colloquy Convivium religiosum ("The Godly Feast"), Erasmus depicts an intellectual exchange between nine educated laymen who interpret Scripture without impinging on the fundamentals of faith. As the character Eusebius says there of his own scriptural interpretation: "Whether it's correct I don't know; I'm satisfied that the idea isn't irreverent or heretical." The interlocutors there do not claim certainty. They only seek to find the most probable scriptural interpretation.[18] Similarly, in his Disputatiuncula (Little Disputation), Erasmus uses the form of dialogue with a missing interlocutor (his friend John Colet) to investigate an adiaphoristic question: whether or not Jesus suffered in anticipation of his crucifixion. Responding to Colet, who maintains that Jesus' divinity precluded him from actually feeling pain, Erasmus takes the position that Jesus, because he also possessed a human nature, did indeed experience dread, fear, and sadness before his death. Because his debate with Colet does not concern an essential of faith, however, Erasmus concedes the possibility of error. Erasmus claims that he would even prefer being mistaken, since his mistakes offer him the opportunity to learn: "In a battle of words, whoever is wise does not want to conquer so much as to be conquered; that is, he does not want so much to teach as to learn. If I lose, I go away more learned, but if I win, I leave you just as happy."[19] In these dialogues, Erasmus acknowledges the legitimacy of doctrinal diversity, but he reveals the full potential of his tolerance in De libero arbitrio, another dialogue with a missing interlocutor.

After much papal pressure to write a book refuting Luther, Erasmus chose to do so in De libero arbitrio, a rejection of Luther's position on the freedom of man's will. Erasmus composed De libero arbitrio in the form of a diatribē, a kind of philosophical dialogue, and not a bitter, abusive denunciation, as a diatribe is defined today. In fact, Erasmus most commonly referred to his piece not as De libero arbitrio, but as Diatriba. The genre's roots are in classical antiquity, where it developed as a popularization of the philophical dialogue, designed to investigate moral issues like the nature of good and evil or the sufficiency of virtue for happiness. It can be distinguished, formally, from other genres of dialogue by its use of a fictional interlocutor, whose personality remains sketchy in the debate.[20]

The theological point in question in Diatriba is whether or not man's will can affect his eternal salvation. Luther denies that it can. No matter how much he desires to, Luther argues, man cannot will himself to fulfill God's law perfectly. Since he cannot, all of his actions, good and bad, are worthless in God's eyes. Justification proceeds from faith alone, which is itself the result of God's grace; salvation is unmerited. Erasmus disagrees. Though acknowledging that faith, not works, is ultimately the key to salvation, he nevertheless maintains that free will plays a role in man's redemption. Why would God have commanded man to choose good over evil, if there were no choice?[21]

In debating free will, Erasmus and Luther do not only disagree on the reality of free will; they also disagree about (1) whether it is essential to take a position on free will and (2) what degree of knowledge is necessary (and possible) in the matter. Luther contends that belief in the nullity of free will is a necessary doctrine.[22] And Luther asserts that certainty, not skepticism, is required of the believer in an essential doctrine like free will.[23] Erasmus

maintains that free will is adiaphoral. The best advice for most men, he writes, is that they "not waste their time or talents on labyrinths of this kind."[24] Implicit in this statement is the belief that it is unnecessary to determine the status of free will. Erasmus maintains that he is free to assume the role of skeptic in this debate: "So far am I from delighting in 'assertions' that I would readily take refuge in the opinion of the Skeptics, wherever this is allowed by the inviolable authority of the Holy Scriptures and by the decrees of the Church."[25] To which Luther responds: "Let Skeptics and Academics keep well away from us Christians, but let there be among us 'assertors' twice as unyielding as the Stoics themselves."[26]

Erasmus expresses his skepticism about free will in the method he adopts to analyze it: argument in utramque partem. In this method of argumentation, perfected by the Academic skeptic Carneades (c. 213-129 B.C.E.), the speaker argues on either side of the question. That the same issue could be argued from either side, the ancient Skeptics reasoned, shows the impossibility of epistemological certainty. The implications of argument in utramque partem, however, are not solely negative. Although it was used to deny certain knowledge, it was also used by the Academic skeptics to determine probability, the closest approximation of truth. By arguing the strengths and weaknesses of each position, the Skeptic could compare the different opinions and decide which one is most probable.[27]

As a dialogue with the missing Luther, Diatriba is structured as an argument in utramque partem. Like the Academics, Erasmus considers both sides of the issue to arrive at the most probable conclusion. He divides the body of Diatriba between scriptural passages supporting free will and passages seeming to oppose free will. Because the biblical texts are ambiguous, Erasmus hopes that he will arrive at probability through a "comparison of Scriptures [collatione Scripturarum]"; as M.O. Boyle notes, Erasmus refers to his De libero arbitrio as a collatio, a comparison.[28] Erasmus's method of collatio finds its classical precedent in Cicero, who defines comparison as one of the subdivisions of probability. "A parallel [collatio]," Cicero writes, "is a passage putting one thing beside another on the basis of their resemblances."[29] Since Scripture has only a single author, Erasmus's form of collatio must ultimately end with textual reconciliation.[30] Thus, he harmonizes the texts in favor of the existence of free will, which he finds the more probable opinion. In particular, Erasmus finds "highly probable [satis . . . probabilis]" the opinion of those who "attribute most to grace and almost nothing to free will, yet do not deny it altogether," since this view "allows man to study and strive, but does not permit him to make any claims for his own powers."[31]

The skepticism of De libero arbitrio--its argument in utramque partem, its tentativeness, and its probabilism--may have been radical for its time, but Erasmus's conception of the skeptical dialogue was not new. It had its source in the tradition of classical rhetoric, particularly in Cicero's vision of the philosophical dialogue. Like Plato, Cicero composed most of his philosophical works in dialogue form: De republica, De legibus, Academica, De finibus, Tusculan Disputations, De natura deorum, De senectute, De amicitia, and De divinatione. These dialogues, Cicero maintained, had their own kind of rhetoric, "the rhetoric of philosophers," which he distinguished from the rhetoric "which we use in the lawcourts."[32]

One characteristic that distinguished this rhetoric of philosophers from legal rhetoric,

Cicero suggests, is its skepticism. Although legal rhetoric generally involves matters that cannot be demonstrated with certainty,[33] Cicero believed that philosophical dialogue was more closely tied to skepticism than was legal oratory. First, the uncertainty of legal cases is ended by the jury's decision. Philosophical debates, however, have no resolution, since they have no authoritative arbiter to settle the question.[34] Second, the subject matter of judicial oratory concerns real facts that have occurred, most likely, in the not-too-distant past. So that even if orators, in judicial matters, can usually present credible arguments on both sides of the case, they are limited in their arguments by evidence. The link between philosophical dialogue's subject matter, which concerns abstract ideas, and the facts, however, is far more tenuous. Therefore, there are fewer restraints on what position a speaker can take in dialogue. In contrast to the concreteness of legal oratory, philosophical dialogue is "something involved in boundless uncertainty."[35] Questions surrounding the fundamental question of the nature of the gods, such as "what opinions are we to hold about religion, piety, and holiness, about ritual, about honor and loyalty to oaths, about temples, shrines, and solemn sacrifices," exemplify the irresolvable subject matter of philosophical dialogue. Of these questions, Cicero writes: "Surely such wide diversity of opinion among men of the greatest learning . . . must affect even those who think that they possess certain knowledge with a feeling of doubt."[36] Skepticism, Cicero concludes, is a persistent attribute of philosophical dialogue.[37]

That philosophical dialogue is skeptical does not in-and-of-itself make philosophical dialogue tolerant. Skepticism does not necessarily lead to toleration. A traditional response to doubt, for example, has been conformity to convention, not toleration of diversity.[38] Philosophical dialogue is tolerant, however, because toleration is thought to facilitate discovery of truth or, at least, dicovery of the most probable truth. No person in the dialogue can claim certain knowledge, but all believe that their discussion moves them closer to truth. And for Erasmus, as for Cicero, each person must decide for himself. Erasmus concludes Diatriba with the words: "I have completed my discourse; now let others pass judgment."[39] The judgment Erasmus refers to here is individual and does not preclude further debate. It is the judgment of philosophical dialogue about which Cicero writes in the Tusculan Disputations, "judgment is free."[40] Erasmus believed that many theological debates, like the debate over free will, cannot be decided. They are questions, like Cicero's philosophical questions, "which do not admit of resolution."

As I have already stated, Erasmus does not permit debate on all theological matters. Doctrinal adiaphora can be discussed in a tolerant dialogue, not the fundamentals of faith. But Erasmus's list of doctrinal adiaphora is lengthy, while the doctrines that he enumerates as articles of faith are limited: "The sum and substance of our religion is peace and concord. This can hardly remain the case unless we define as few matters as possible and leave each individual's judgment free on many questions."[41] Only doctrines that have a clear scriptural source are defined as essential. About these dogmas Erasmus writes: "I do not put less faith in the divine scriptures, than if I heard Christ Himself speaking them to me with His own voice; and . . . I doubt less about the things I read there than I do about what I hear with my ears, see with my eyes, and clutch with my hands."[42] But most doctrines, according to Erasmus, do not have a plain basis in Scripture. For example, although Erasmus declares the doctrine of the Trinity to be essential, he views most related doctrines

as adiaphoral.[43] Likewise, Erasmus thinks that the doctrine of the Immaculate Conception, the divine right claims of the Church hierarchy--pope, cardinals, and bishops--and most questions about the sacraments are all adiaphoral.[44]

The consequence of Erasmus's strict standard for the fundamentals of faith is greater toleration. The fewer the articles of faith, the greater latitude there is for religious diversity, and the fewer people there are to be labelled heretics. Not only is Erasmus unwilling to label Luther a heretic, he even intimates that the followers of the heresiarch Arius (died 335) were not heretics.[45]

Limiting fundamentals, however, cannot be equated with full toleration since Christians are still held accountable for essential beliefs. And Erasmus, though he urges the prince to use restraint and choose persuasion over coercion whenever possible, does ultimately permit capital punishment against heretics "in the most necessary cases."[46] The state, Erasmus concedes, can execute heretics who pose a threat to civil order: "Even if it is not permitted to kill [simple] heretics, it is certainly lawful to kill blasphemers and rebels, since [killing them] is necessary to protect the state." [47] Erasmus does not support capital punishment as a common recourse to heresy, since, in practice, he never condones a single heretic's execution.[48]

The Decorum of Dialogue

Because of its relationship to dialogue, Erasmus's theory of toleration addresses more than just the question of **what** can be discussed. An important element of Erasmian toleration is also **how** something should be discussed. Erasmus justifies toleration because he believes it will reveal more truth. But as a rhetorician he understands that how a speaker expresses himself is as important as the idea he expresses. Cicero, for example, writes that "[a]lthough a word has no force apart from the thing, yet the same thing is often either approved or rejected [that is, seems plausible or not to the listener] according as it is expressed in one way or another."[49] It is a fundamental principle of rhetoric that speakers, to be successful, must be mindful of propriety or decorum. "I shall begin by approving of one who can observe what is fitting," Cicero writes. "This, indeed, is the form of wisdom that the orator must especially employ--to adapt himself to occasions and persons."[50] Although the principle of decorum is common to all types of rhetoric, the rules of decorum will vary depending on the type of speech in question. Thus, philosophical dialogue, with its particular characteristics, possesses its own rules of decorum, distinct from the three major genres of public oratory: deliberative, judicial (forensic), and epideictic (demonstrative).

The decorum of philosophical dialogue is tolerant in a way that is distinct from the decorum of public oratory. Public oratory addresses matters that the public-at-large can understand and decide. The deliberative, judicial, and epideictic genres concern, respectively: political issues; the innocence or guilt of the accused; and a man's personal character. As a consequence of public oratory's popular character, rhetoricians have traditionally viewed emotional appeals as a necessary part of its decorum. Emotional appeals are required, Quintilian maintains, in all three types of oratory.[51]

The result of public oratory's emotionalism is that while the audience's decisions are not physically coerced, speech still takes place in an intolerant atmosphere. This intolerance is manifested in the orator's emotional manipulation of the audience. Because public oratory

addresses the common people, the classical rhetoricians presume that the orator must compel his audience, emotionally, to arrive at the proper decision. Thus, Quintilian writes: "[U]nless we [orators] force, and occasionally throw them [the audience] off their balance by an appeal to their emotions, we shall be unable to vindicate the claims of truth and justice.[52] Reason may be sufficient for philosophers, but the masses do not decide on reason alone. Cicero even counsels the orator to prefer emotion to reason. The hearer, he writes, should be "so affected as to be swayed by something resembling a mental impulse or emotion, rather than by judgment or deliberation. For men decide far more problems by hate, or love, or fear, or illusion, or some other inward emotion, than by reality. . . ."[53] By manipulating his audience's emotions, the orator signals his lack of respect for his listeners. They, in his mind, are an unthinking mass that must be moved. Even the good orator (vir bonus dicendi peritus) does not acknowledge his listeners' abilities to discover and understand truth and justice. Instead, he assumes that if the claims of truth and justice are to be vindicated, he must maneuver his audience into doing what is right.[54]

The decorum of philosophical dialogue, however, is different from public oratory in its lack of emotionalism and attending intolerance. It is possible to avoid emotional appeals in philosophical dialogue because of the nature of the participants. Public oratory, the classical rhetoricians argue, is addressed to large, popular audiences incapable of finding truth for themselves. But philosophical dialogue takes place in the context of a small, elite group. Philosophical dialogue deals with questions that are considered beyond the grasp of the common man. Echoing Plato of the Republic, Cicero contends that it is not simply that the masses are intellectually incapable of being philosophical, but that the masses are naturally antiphilosophical: "For philosophy is content with few judges, and of set purpose on her side avoids the multitude and is in her turn an object of suspicion and dislike to them, with the result that if anyone should be disposed to revile all philosophy he could count on popular support."[55] For Cicero, the people's bias against abstract thinking absolutely precludes a popular setting for philosophical discussion. Like Cicero in his philosophical dialogues, Erasmus in Diatriba designates his audience as the learned elite. The investigation he conducts in De libero arbitrio, Erasmus writes, "has always been considered most proper for scholars."[56] The Diatriba's limited audience contrasts with the popular audience of ancient deliberative oratory (the political assembly) and of Erasmus's own version of the deliberative genre (preaching) which was addressed to all classes of society.[57]

Cicero and Erasmus assumed that because philosophical dialogue was limited to a learned elite searching together for truth, decorum required that the interlocutors eschew emotional manipulation. For Cicero, the philosopher, unlike the multitude, can deliberate rationally: "For it is expedient for the man who cannot resort to reason, to resort to an emotion of the soul: we on the other hand are asking . . . about the wise man."[58] Therefore, while public oratory is marked by "extreme energy and passion," and a "vigorous style," philosophical dialogue, which is speech among the select, is serene and restrained.[59] And while, for Erasmus, emotional manipulation is sometimes appropriate for public oratory--preaching--it is not suitable for scholarly dialogue: "in the disputing of truth, . . . it is moderation which pleases."[60]

Classical rhetoric's two nonrational proofs, ethos and pathos, are excluded from philosophical dialogue.[61] Ethos, the appeal to the speaker's authority, is eliminated

because, as Cicero argues, relying on someone else's opinion--Cicero includes himself--substitutes blind faith for reason.[62] Cicero cites the Pythagoreans as examples of this uncritical acceptance of authority. In lieu of rational argument, the Pythagoreans replied to their opponents with the words "Ipse dixit," or "He himself said so," referring to their master Pythagoras. The Pythagoreans' error was not that they appealed to authority, since ethos was a legitimate rhetorical proof. Their error was that, in using such appeals in philosophical discussion, they transgressed rhetorical decorum, which limited philosophical dialogue to rational proof. Following Cicero's example, Erasmus rejects ethos in his debate with Luther, using Cicero's criticism of the Pythagoreans against Luther's followers, who "approve with unrestrained zeal whatever you [Luther] taught: 'He, himself, has spoken it!'"[63]

Likewise, pathos, the eliciting of the audience's passions, is rejected in philosophical dialogue because the passions, whether "distress and fear," on one extreme, or "extravagant joy and lust," on the other, "conflict with deliberation and reason."[64] Passions, "the agitations of the soul alien to right reason," cause an unsoundness of mind in the interlocutors, which prevents them from arriving at the truth, or its closest approximation.[65] To ensure that the interlocutors' emotions are kept in check, Cicero and Erasmus goes so far as to control the dialogue's external environment. Thus, the setting for Cicero's dialogues is almost always his gardens and villa, like his villa at Tusculum, a relaxed milieu, distant from the agitation of the city.[66] And Erasmus, in his colloquy Convivium religiosum, locates discussion in the garden of a countryside villa, limiting the number of interlocutors to nine, "the number of muses."[67]

By adopting Cicero's decorum of dialogue, Erasmus creates an environment for theological debate that is tolerant in more than its absence of persecution. It is possible to refrain from physical abuse and still be intolerant. As I noted above, emotional manipulation does not involve force yet is coercive. Looking solely at the physical side of intolerance ignores the fact that intolerance often has a psychological dimension or sometimes has only a psychological dimension to it, as in the example of the Amish, who oppose any external punishment for religious error, but exact psychological payment from dissenting members through the practice of social avoidance or "shunning" (Meidung).[68] Erasmus shows concern for psychological intolerance because it is a person's state of mind, not physical condition per se, that affects his ability to discover truth. Therefore, Erasmus maintains, that to arrive at truth, the interlocutors must treat each other respectfully. He describes his disputation with Luther as "temperate . . . for the purpose of eliciting the truth." He writes that he pursues the matter without recrimination, "because in this way the truth, which is often lost amid too much wrangling may be more surely perceived." He uses gentle words in Diatriba, "so that truth might shine forth more unfalteringly." Erasmus denies that he is engaged in gladiatorial combat with Luther. Combat, he explains, will only obstruct the search for truth. Erasmus offers the example of "two combatants who, in the heat of a quarrel, turn whatever is at hand into a missile, whether it be a jug or a dish." He questions the reader: "what sort of sincere judgment can there be when people behave in this way? Who will learn anything fruitful from this sort of discussion--beyond the fact that each leaves the discussion bespattered with the other's filth?"[69] Like Cicero, Erasmus concludes that truth is furthered by a more harmonious relationship between interlocutors.

BODIN

The Purpose of Dialogue: Bodin's Alternative

Like Erasmus, the French-born Jean Bodin was trained as a humanist. Bodin's humanism, however, had a more practical bent than Erasmus's. Reflecting the late, particularly French, humanists' interest in academic jurisprudence, Bodin studied law at the University of Toulouse. He also became involved in politics, serving members of the royal court in a variety of capacities and acting as deputy for the Third Estate of Vermandois to the Estates General. Bodin's most enduring legal and political legacy, however, is the Six livres de la république (1576), a systematic explanation of French and universal public law.[70]

Besides his interest in legal and political matters, Bodin was also concerned with religious issues. Consistent with his political interest, was his support, in the République, of the Politique position. The Politiques believed that the question of religious toleration should be determined by what best furthered political stability. Ideally, the Politiques argued, the state should enforce outward religious uniformity because confessional differences might lead to civil unrest. But in states, such as France, where a religious minority has grown too large to be easily suppressed, toleration should be granted.

Bodin's personal religious views are unclear.[71] He was born a Roman Catholic, supported the Catholic League against the then Protestant Henry of Navarre (King Henry IV), and was buried a Catholic in the Church of the Franciscans at Laon, at his request. Nevertheless, throughout his life Bodin was dogged by the widespread suspicion that he was a Protestant heretic. He was probably charged with heresy as a youth in 1547; he was arrested and imprisoned for a year-and-a-half, from 1569-1570, for being a Protestant; and because of continuing fears that he was a heretic, he was questioned (but cleared) by the lietenant-general of Laon in 1587. Bodin has also, from very early on, been suspected of being a closet Jew or at least a Judaizer.[72] Regardless of his personal religious beliefs, Bodin supported the toleration of almost all religious convictions. He does so in his Colloquium heptaplomeres.

The Colloquium heptaplomeres is a series of conversations, divided into six books, between men of seven different religions: Paulus Coronaeus, a Catholic; Fridericus Podamicus, a Lutheran; Antonius Curtius, a Calvinist; Salomon Barcassius, a Jew; Octavius Fagnola, a Moslem; Diegus Toralba, a proponent of natural religion; and Hieronymus Senamus, a skeptic. The participants discuss a wide variety of topics, including the nature of God, how He expresses himself through nature and the spirit world, man's role in the universe, the natures of interpretation, music and musical harmony, and good and evil. The Colloquium's central discussion, which takes place mostly in Book 4, concerns the question of the true religion.

Like Cicero and Erasmus, Bodin creates a dialogue in which the interlocutors observe the rules of decorum. Their conversation is courteous:

> They lived not merely with sophistication of discourse and charming manners, but with such innocence and integrity that no one so much resembled himself as all resembled all. For they were not motivated by wrangling or jealousy but by a desire to learn; consequently they were displaying all their reflections

and endeavours in true dignity.

Again, like Cicero and Erasmus, who maintained that philosophical and theological debate should be limited to a small educated elite, Bodin portrays the seven interlocutors in the Colloquium as "exceptionally well trained in the disciplines of the liberal arts," with "each seem[ing] to surpass the others in his unique knowledge."[73] The dialogue's setting was designed to foster moderate, learned discussion. The group meets in the Venetian home of Coronaeus. Venice, as is noted in the Colloquium, offers its people "the greatest freedom and tranquillity of spirit." Coronaeus's home itself "was considered a shrine of the Muses and virtues."[74] To encourage scholarly conversation, Coronaeus had filled his home "not only with an infinite variety and supply of books and old records, but also instruments either for music or for all sorts of mathematical arts." Among these artifacts was the pantotheca, an unusual armoire built of olive wood, which housed in its 1296 small boxes "the universe, its goods, and materials." In this collection, were "likenesses of sixty fixed stars," "replicas of planets, comets and similar phenomena, elements, bodies, stones, metals, fossils, plants, living things of every sort," and so on. These assorted objects could be viewed and studied to sharpen the minds of the interlocutors.[75] And to calm the spirits of the interlocutors, Coronaeus arranged for choirboys to sing divine praises at the end of each day's discussion.[76]

Although the Colloquium is similar to Erasmus's dialogues in its decorum, when judged by the goals of Erasmian dialogue, it is a failure. It is this traditional conception of dialogue that most scholars implicitly accept when they brand the Colloquium a failed dialogue.[77] In Georg Roellenbleck's words, "[t]he Heptaplomeres is the protocol of a failure, a failure of dialogue, a failure of rational discussion of religious material."[78] For Erasmus, as for Socrates and Cicero before him, the participants in a dialogue work together to discover the truth. And the closer the participants approach the truth, the more they will agree. But the interlocutors in Bodin's Colloquium do not agree. In fact, the dialogue's characters are never able to move any of their fellow speakers from their original beliefs. As Quentin Skinner explains, the participants recognize in their inability to persuade the futility of religious discussion. It is because religious discussion is useless, Skinner argues, that we are told in the dialogue's conclusion that "afterwards they held no other conversation about religions."[79] Similarly, Joseph Lecler writes that the speakers' lack of consensus signals Bodin's belief that "the old policy of colloquies, which had once been advocated by the Christian humanists, had been finally condemned by experience."[80]

Bodin's Colloquium, however, is only a failure if we accept the traditional conception of dialogue. Roellenbleck declares the Colloquium a failure because he pressuposes this conception, even though he concedes that the participants in the dialogue have "learned alot."[81] This benefit does not count, for Roellenbleck, because "in the end, nothing has changed. . . . Nobody has been convinced or has modified his position." But what if, pace Roellenbleck et al., "learning alot" does matter, learning both about others' beliefs and, through them, about your own? Then the participants lack of unity would not, by itself, indicate a failed dialogue.

The inability of Bodin's interlocutors to agree on religion stems from their differing assumptions. Unlike Erasmus's dialogues on doctrinal adiaphora, the conversations in Bodin's Colloquium revolve around the fundamentals of faith and there is no consensus

among the interlocutors about the fundamentals. The Jew, the Moslem, and the follower of natural religion reject Christ as Lord. And the Christians' proofs derived from New Testament citations are meaningless to them. Yet for Christians, as Coronaeus explains, "If you reject the evangelical testimonies, it is as if you denied the principles of the sciences, without which not even the geometricians will have any proof."[82] Unable to agree on the basic proofs of argument, the interlocutors lack the tools of persuasion. Accordingly, Senamus states: "I think those discussions about religion will come to nothing."[83]

Paradoxically, although Bodin's characters discuss religion, they, like Erasmus, criticize discourse between religions because it may lead to skepticism. In line with Erasmus, they believe that questioning the fundamentals of faith imperils one's soul. And reflecting Bodin's own political ideas, the characters in the Colloquium fear the effects of religious skepticism on the state's stability.[84] In Book 4 of the Colloquium, Fridericus raises the question of religious discussions between members of different faiths, while attempting to lure Salomon into debate. Fridericus maintains that though "[i]t is both dangerous and destructive for the masses to engage in discussions about the accepted and approved religion unless one can control the resisting common people. . . , private discussion about divine matters among educated men" is most fruitful.[85] The other speakers respond in turn that debates about religious fundamentals should be avoided. Thus, Toralba observes that people should keep away from religious discussion lest it cause a believer "to abandon the religion of his ancestor," tearing him away from the faith "which God has bestowed from his bountiful goodness."[86] Salomon declares that "according to our laws and customs we are prohibited from discussing religion . . . lest divine laws seemed to be called into doubt"--doubt that "produces the opinion of impiety."[87] Senamus, citing Siena's ban on "discussions about divine matters and the decrees of the popes," links the prohibition on religious disputes to civil peace.[88] Similarly, Octavius proclaims the danger of religious debate--"dangerous enough in private but even more so in public." According to Octavius, "if it is not permissible to argue about human laws [in the Florentine republic and in ancient Sparta] so that there will be no approach for breaking the laws through disputation, how much less should this be done about divine laws."[89] And Curtius states that the ancient prophets thought it laudable to abstain from discussions about one's own religion with outsiders. Therefore, Curtius continues in a relativist fashion, "Christians should not cast doubt on the articles of their own faith, nor should Jews among each other or Mohammedans among each other."[90]

Even Coronaeus, who favors religious dialogue and who, along with Fridericus, implores Salomon to enter the discussion about religion, concedes that he is unwilling to question his own religious doctrines. Religious discussion, for him, is a means "to lead into the proper pathway of salvation the converts, catechumens, the demoniacs, the Ismaelites, Jews, Pagans, and Epicureans who have wandered from the straight path." But Coronaeus opposes Christians discussing the tenets of their faith among themselves, for fear that they become "hopelessly entangled by doubtful considerations and involved in various errors."[91] Coronaeus wants non-Catholics to question their religions, but as for himself, he states: "I shall not allow myself to be carried away by the arguments of any one or to be separated from the accepted religion of the Roman pontiffs."[92] Only the dogmatic Fridericus, so confident that his faith cannot be shaken, unequivocally supports religious dialogue.[93] The

rest assert that it is wrong to engage in any activity that casts doubt on their own dogmas.

The speakers find support for their fears in the fact that religion is inherently uncertain. "Religion," Toralba explains, "will be grounded either in knowledge or opinion or faith." Knowledge cannot be the sole basis of religion, since true knowledge requires "proof based upon the surest principles and fortified by necessary conclusions," and the different religions have not provided such proof. We are left, therefore, with opinion and faith, neither of which is certain. "If religion depends on opinion, that ambiguous opinion wavers between truth and falsehood and totters during hostile discussion." And faith, which is "pure assent without proof," can be lost. For if we receive our faith from our trust in another person's word, when "we reject this opinion of his uprightness or erudition, we lose faith."[94] And if faith is granted by divine infusion, it can, by definition, be lost: any belief that is "inevitable and fixed so that it cannot be lost . . . is force, not faith."[95]

Despite agreeing that religious dialogue is dangerous, the characters of the Colloquium still go on to discuss religion; they reject the traditional model of dialogue in which everyone's beliefs are open to scrutiny, but are still willing to present their religious views. The Colloquium's speakers reconcile their criticism of religious discussion with their participation in it by creating a kind of dialogue that does not bring about the skepticism they dread. In contrast to the traditional dialogue, their conversations reinforce their original beliefs. The final words of the Colloquium confirm this deepening of opinions. The speakers, the text states, spoke no more about religions, "although each one defended his own religion with the supreme sanctity of his life."[96]

How can a dialogue across religious lines strengthen the believer's faith? Toralba provides the answer. Anticipating an argument made centuries later by John Stuart Mill, he argues that we understand ourselves only by way of contrast with others:

> In a state of illustrious men justice, integrity, or virtue would not even be perceived unless wicked men mingled with the good, sane with the mad, brave with the cowardly, rich with the poor, low with the noble, were contained within the same walls, provided that evils, if evils are anywhere, are weaker than good. Indeed, these discussions which Coronaeus began would offer no purpose or pleasure unless they took lustre from opposing arguments and reasons.[97]

The exercise of defending his religious beliefs against those of the others clarifies each speaker's views to himself. What is initially held as an unreflected prejudice is retained, after discussion, as an intellectually defensible--if not fully demonstrable--opinion.

In addition to reinforcing their beliefs through argumentation, the Colloquium's speakers also intensify their religious resolve through poetry. There are eleven poems exalting God that the interlocutors recite in the Colloquium; six are recited after the discussion of religious differences begins.[98] And of these six poems, at least five either single out the speaker's own religion for praise or condemn the theology of a competing religion. For example, in his poetry, Salomon praises the unique nature of the Hebrews: their covenant with God on Sinai, where they were given the divine laws; and the special protection God grants them.[99] And in his poem, Coronaeus celebrates Christ, the redeemer of humankind, as the source of earthly kings.[100] Finally, Octavius directs his poem against the Christian doctrine of original sin.[101]

Like the speakers' arguments in the Colloquium, this tendentious poetry does not persuade anyone to change religions. Such poetry is never intended to persuade nonbelievers. Rather, the speakers recite poetry to arouse their own faiths. By turning to poetry, the participants indicate that when dealing with religion, rational argument is not enough. It is not sufficient for the participants to intellectualize about their specific doctrines. They must also feel their religion. And poetry is the means by which the characters impress their religion upon their souls.

Instead of giving up on religious discourse, as most commentators contend, Bodin suggests that religious discussion moves the participants to a higher level of understanding. He expresses the dialogue's maturational powers in musical terms. During the course of the dialogue, the speakers traverse the range of musical genera, from the diatonic, which allows only seven tones, to the chromatic, which allows tones and half tones equalling twelve, to the more complex enharmonic genus. Coronaeus alludes to this progression in a song, based on Psalm 133, sung at the conclusion of the Colloquium: "Lo, how good and pleasing it is for brothers to live in unity, arranged not in common diatonics or chromatics, but in enharmonics with a certain more divine modulation."[102] Like the advancement of musical genera in Coronaeus's song, the participants in the Colloquium have moved through the dialogue to a higher level. Because enharmonics is the more refined and arcane genus, it represents, for Bodin, greater understanding. As Nicolo Vicentino argues in his L'antica musica ridotta alla moderna prattica (1555), enharmonics is reserved "for the few--for people with cultivated taste, not for the common folk."[103] And Bodin, influenced by "the Hermetic belief that the deepest truths cannot be revealed to the multitude," equates the esoteric with the deeper truth.[104] It is because the speakers in the Colloquium have reached a higher level, that they hold no further conversations about religion.[105] They have achieved their goal.

Although Bodin values dialogue for elucidating a speaker's opinion to himself, this benefit alone is insufficient to justify toleration. St. Thomas Aquinas, for example, allowed that heresy played a positive role in the search for truth since it permitted the faithful to contrast truth with error. Nevertheless, St. Thomas supported the death penalty for heretics. To Aquinas, their error was not essential to the discovery of truth.[106] Why, then, does Bodin grant his characters the opportunity to defend and praise their religions, when none of his contemporaries do so? Even Erasmus, who supported limited toleration, does not grant equal status to heretics and non-Christians, because he believes their errors to be damnable. The key to Bodin's exceptionalism is his conception of religious truth.

The Nature of Truth

Bodin sees religious truth as a complex whole--what Marion Daniels Kuntz refers to as "a unity based on multiplicity (concordia discors)"[107]--with each religion forming a part of the greater whole. Bodin, however, does not view these elements as thoroughly consistent with each other, but as subsisting in a state of tension. Taken together, the different religions express the unity of truth, yet each particular religion conflicts with the others. Once again, Bodin relies on a musical metaphor to convey his idea. In a conversation about harmonic theory that he initiates, Coronaeus opines that the sweetest harmony is achieved "with the full system of the highest tone blended with the lowest, with the fourth and fifth

interspersed." In contrast, "harmonies in unison, in which no tone is opposite, are not pleasing to the trained ear."[108] This idea that harmony or truth inheres in different opposing elements is voiced by other speakers. Toralba observes that what is most pleasing to the senses is "a harmony which depends on the blended union of opposites."[109] And Curtius recites a poem praising God for His universe based on opposites: "This greatest harmony of the universe though discordant contains our safety."[110]

Nature's blending of opposites does not destroy the individual components. The elements retain their separate identities. The opposing elements of nature, Toralba explains, are forms, like the contrary forms of fire and water. And "things which are contrary to each other in nature herself cannot be mingled by design, but only blended, joined, or united so that they seem to be one."[111] Like nature, religious truth is also composed of distinct elements whose differences cannot be ignored. Although tolerant of different religions, Octavius still declares: "Truly we ought to despise the blending of sacred rites."[112] We cannot treat opposing religions as if they are the same. Similarly, Salomon rebukes Senamus, who adopts the practices of all religions:

> I would prefer that you were hot or cold rather than lukewarm in religion, Senamus. And yet, how is it possible to defend the religions of all at the same time, that is, to confess or believe that Christ is God and to deny that He is God, that He has been overcome by death and snatched from torment, that bread becomes God, and does not become God, which things cannot happen at the same time through nature.[113]

Salomon's fellow participants follow his advice, remaining steadfast in their convictions. Each person believes that by doing so he protects the purity of his faith, which alone reveals the full truth. Bodin, however, does not identify with any single religion. He recognizes the divine descent of all religious beliefs.[114] Thus for him, religious differences should not be retained for the sake of any single religion, but because they, collectively in their opposition to each other, contain the whole truth. The variety of religions mirrors the contrariety of the universe. In Curtius's words, it is "the variant natures of individual things [that] combine for the harmony of one universe."[115]

Bodin emphasizes that the opposition of individual elements must be kept within limits, that the contrariety of extremes must be curbed. The participants in the Colloquium point to intervening elements as a moderating force. In music, "extreme opposites are brought together by intermingling of the middle tones (Fridericus)." In nature, opposites are "united by the interpolation of certain middle links." These links "present a remarkable harmony of the whole which would otherwise perish completely if this whole world were fire or moisture (Toralba)." In planetary movements, "the contrary force of Mars and Saturn is restrained by the intermediate light of Jupiter (Fridericus)." And among philosophic schools, the opposite camps of Epicureans and Stoics were joined, as if by certain bonds, midway by the Academicans and Peripatetics (Toralba)." Such intermediate schools were necessary, for "if one opposite were joined to another opposite with no middle ground between, there would necessarily be continual battle." It is also safer when a political office is divided between three persons instead of two. "For a third party forces two opposing factions toward harmony, when the others have allied themselves (Coronaeus)." Finally, a state split into two factions, divided about laws, honors, or religion, is bound to destroy itself. "If,

however, there are many factions, there is no danger of civil war, since the groups, each acting as a check on the other, protect the stability and harmony of the state (Curtius)."[116]

To moderate conflict, Bodin does not construct the Colloquium as a bipolar dialogue between extremes. Instead, he includes in the Colloquium a spectrum of religious opinions. The opposition between the three Christians, who believe in divine revelation and in Christ as the son of God, and the natural philosopher and skeptic, who deny or question these beliefs, is mediated by the Jew and the Moslem, who believe in divine revelation, but deny Christ's divinity. Bodin also curbs the opposition between speakers by following the rhetorical rules of decorum. As noted earlier, the decorum of the Colloquium resembles the decorum of Erasmus's dialogues. Unlike Erasmus, however, Bodin does not follow these rules for the purpose of finding the one truth. For Bodin, the rules of decorum represent the unity of the parts within the whole. Like the opposing elements of nature, the interlocutors in the Colloquium are part of a common universe and conflicts between them must be restrained. Despite their differences, they are described at the end of the dialogue as brothers living in unity.[117]

Consistent with the view that each religion possesses some aspect of truth, all the participants call for toleration.
Coronaeus assures his guests "the greatest freedom in speaking about religion."[118] For Toralba, "the law of nature and natural religion which has been implanted in men's souls is sufficient for attaining salvation."[119] Presumably, therefore, all religions that adhere to the natural law should be tolerated. Curtius, as already seen, argues that many sects can live together more peacefully than two. He also cites the Church Fathers and the Church Councils as supporting the principle of toleration: "'It is not for religion to compel, which ought to be undertaken of one's own accord, not by force.'"[120] Senamus holds up the example of Jerusalem, where eight Christian sects, Jews, and Moslems coexisted, each group tolerating the rest.[121] While Octavius applauds the tolerance of the kings of the Turks and Persians and the religious freedom of Venice.[122] And Salomon affirms that no "more serious insult against God can be conceived than to wish to force anyone to obey Him."[123] Because religion should not be coerced, he explains, Jews do not force their religion on gentiles--although Salomon is unwilling to tolerate Jewish apostates.[124] By the conclusion, even Fridercus, the most dogmatic of the interlocturs, agrees that faith cannot be compelled. The Emperor Theodoric's opinion, he states, "is worthy to be inscribed in golden letters on the door posts of princes. . . , that we are unable to command religion because no one can be forced to believe against his will."[125]

The Argument from Conscience

I have until now discussed what I see as Bodin's primary argument for religious toleration: that each religion represented in the Colloquium can claim for itself a right to be tolerated because it is a part of the truth. Bodin, however, offers another, seemingly more modern justification for toleration that does not depend on a religion's veracity: the argument from conscience. According to this argument, any person that is genuine in his beliefs, even if wrong, will be saved. Octavius, the most consistent defender of conscience in the Colloquium, includes sincere idolaters and polytheists among the saved, despite his strict monotheism:

> Although those who hold statues and stars in the same esteem as gods or join angels and the souls of saints to the eternal God by the same rites, do not act rightly. Still they deserved to be excused in some way because, with pure heart and soul and an upright conscience, they were thus instructed and trained by the priests and thus worship the divinity that was known to them and related to them.[126]

Octavius finds support from the non-Christian interlocutors. Salomon, who like Octavius is repelled by the Christian doctrine of the Incarnation, concedes that "even worship which is offered in good faith to a clay god is not unpleasing to eternal God."[127] And Toralba and Senamus, agree that "a just error is erased by a just excuse" and that all religions practiced "not with faked pretense but a pure mind" are "not unpleasing to eternal God."[128] The Christian, particularly the Protestant, interlocutors, however, have less regard for the sincere conscience. While Octavius cites both St. Thomas Aquinas and St. Augustine as respecting the erroneous conscience,[129] the Protestant participants--like the Catholic Aquinas--do not believe that heretics are capable of sincere error. Fridericus denies that there can be a just error for impiety. And Curtius does not excuse ignorance of divine law because it "has been manifested so often and so long throughout the world." They assume that once someone is shown the truth, then any departures from it must be willful and perverse.[130]

Although the arguments on behalf of the erring conscience focus on the otherworldly question of salvation, they have temporal implications. The argument from conscience undermines the orthodox Christian justification of religious persecution, which states that the heterodox must be punished for their damnable errors. First, some theologians, like St. Augustine, argued that heretics should be punished for their own good, hoping that punishment would help them question their errors and put them on the road to salvation.[131] Second, other theologians justified persecution because of the enormity of the heretic's crime. Heretics were viewed as an insidious, corrupting force within the body of the faithful. Comparing heresy to forgery, which was then a capital offense, St. Thomas Aquinas argued that the heretic's crime was worse than the forger's: "It is, indeed, far more serious to pervert the faith which ensures the life of the soul than to counterfeit money which is only necessary for our temporal needs.[132] Despite their differences, both arguments presume that a belief in orthodox doctrines is necessary for salvation. Bodin's argument from conscience, however, denies this assumption. And once this assumption is denied, both justifications of persecution are weakened, if not overturned. The argument that a heretic must be persecuted for his own good no longer makes sense if he can gain salvation, in spite of his objective errors. Similarly, once it becomes possible to respect sincere error, even on the fundamentals of faith, it becomes difficult to accept the image of the heretic as the ultimate malefactor, who must be eradicated for his crimes.

If Bodin tolerates not only the seven religions of the Colloquium, but any sincere faith, does he tolerate all religious opinions? The answer is yes, with one exception--atheism. For Bodin, atheists are a threat to society. Thus Coronaeus restates in the Colloquium what Bodin himself argues in the République. Believers in any religion, no matter how superstitious, are "kept by this awe of the divine in a certain way within the bounds of duty and of the laws of nature. The atheist, on the other hand, who fears nothing except a witness or a judge, necessarily rushes headlong toward every crime."[133] This

assumption that atheists are a danger to social order was unquestioned during Bodin's time. Even a century later, John Locke argues, in his Letter Concerning Toleration, that atheists are not to be tolerated, since "[p]romises, covenants, and oaths, which are the bonds of human society," can have no hold over them.[134]

Bodin's unwillingness to tolerate atheists is based on more than his political concerns. It fits with his general defense of religious toleration. Bodin's defense is premised, first, on the idea that each religion possesses some element of truth. Bodin, however, dismisses the possibility that atheism has any truth. Judging atheism by the standard of consensus, which has been used as a criterion of truth since the ancient Greeks,[135] Bodin finds that all people agree that there is a God. Belief in God, Toralba says, "seems to have been planted, as it were, by nature herself in the hearts and minds of all men."[136] And while Senamus notes that many recognize other divinities besides God, he states that "[a]ll men recognize that God is the Parent of all gods, as far as I know."[137] Rejecting atheism as an objective possibility, Bodin also denies the atheist's subjective claims to conscience, thereby negating the second justification of toleration. Like Aquinas, who assumes that all heretics are maliciously motivated, Bodin assumes that no atheist is truly sincere. Whatever religious doubts people entertain, can never genuinely extend to the existence of the Deity. To emphasize this point, Bodin has the skeptic, Senamus, equate atheism with deceit. There are four groups of atheists, according to Senamus, which range from those who dissemble for self-interest to those who avow their atheism, publicly and privately mocking at everyone's religion.[138] Regardless of the particular categories, however, Senamus supposes that all atheists have bad intentions. And therefore, these persons who act out of bad conscience cannot assert a liberty based on a right to conscience.

CONCLUSION

I have presented in this essay two different models of dialogue and the theories of toleration derived from them. The first kind of dialogue, exemplified by Erasmus's De libero arbitrio, aims at a common discovery of the truth or the closest approximation of it. In this type of dialogue, the speakers may have tentatively arrived at their own points of view, but because they are still searching for the truth, they adopt a skeptical stance toward the issue under discussion. They also treat each other and each other's opinions respectfully, not only because it is wrong to persecute another when your yourself are uncertain of the truth, but because civility promotes the discovery of truth. The theory of toleration implicit in this type of dialogue is nothing short of an early version of the argument from truth, that is, the argument that free speech should be safeguarded because it leads to the discovery of truth.[139] Erasmus anticipates Milton and Mill's defense of free speech, as well as the particular version of the argument from truth known as "the marketplace of ideas." Of course, Erasmus does not apply this full toleration to all religious opinions--only the nonessentials; and he does not grant this freedom of discussion to all individuals--only the learned elite. Nevertheless, Erasmus establishes a paradigm for toleration that will eventually be expanded beyond these limitations.

The second type of dialogue is represented by Bodin's Colloquium heptaplomeres. In contrast to the interolocutors in Erasmus's dialogue, the participants in the Colloquium do

not want to reconsider their own opinions. On the contrary, they must overcome their fears that a dialogue about religion may lead them to skepticism. What Bodin's interlocutors want from a dialogue, and what they get in the end, is a confirmation of their beliefs. By defending their beliefs against the criticisms of others, the Colloquium's speakers emerge from the dialogue with a fuller understanding of and faith in their respective religions. Bodin allows each speaker to retain his initial beliefs because, for Bodin, each speaker represents a part of the truth. And to achieve the full religious truth, the multiplicity of religions must be presented. As the characters in the Colloquium explain, truth is a complex whole composed of contradictory elements. Bodin supports toleration because he believes that no one religion has a monopoly on the truth. In addition, Bodin offers the argument from conscience as another justification of toleration. He contends that sincere worship, even of false gods, should be protected. The true God, the Colloquium's characters say, accepts heartfelt, albeit mistaken, worship. Only atheists are denied their right to conscience. Like his contemporaries, Bodin assumes that atheists are threats to their society, and he denies that they can ever be sincere in their convictions.

One final point. In this essay's Introduction, I suggested that one practical difference between the two types of dialogue is that Erasmus's is more restrictive than Bodin's. Implicit in Erasmus's dialogue is a monistic conception of the truth that excludes from discussion those ideas that contradict an accepted truth. In contrast, Bodin's dialogue accepts a multiplicity of truths. and can, therefore, permit discussion of ideas that contradict what is already "known" to be true. This difference between the two types of dialogue, however, only touches on the question of what should or should not be legally tolerated. But the difference between these two types of dialogue concerns another practical implication more subtle than that of legal toleration. It raises the question of whether, in tolerant societies, dialogues between fundamentally divergent persons or groups are beneficial. For it is possible to accept the Erasmian conception of dialogue--that the purpose of discussion is to work together to find the truth--and to still call for full toleration, if one accepts a number of nontruth-related rationales for toleration and freedom of speech, such as the arguments that freedom of speech promotes dissent,[140] self-fulfillment,[141] and that censorship impairs the dignity and equality of the silenced speaker.[142] The willingness to tolerate diverse opinions, however, does not mean that controversial dialogue in a pluralistic society should be valued as a normative good. From the Erasmian perspective, only dialogues that move the interlocutors toward agreement are useful. Thus, academic, political, or religious discussions in which the participants seek the most plausible theory, a common answer, or some compromise would be legitimate. But if agreement is the goal, a dialogue between persons holding fundamentally different opinions will be futile. To take an example from our own society, if we accept Erasmus's point of view, a dialogue between supporters and opponents of abortion rights, euthenasia, or any other debate whose basic assumptions are irreconcilable, would be senseless. Bodin's Colloquium, however, suggests that such dialogues may be beneficial. Conversation, even with an inflexible "other" offers the speakers the advantages of both self-discovery and of possibly learning another aspect of a greater, more complex truth.

7. W.K.C. Guthrie's description of the Socratic dialogue is relevant: "[P]hilosophy was summed up for [Socrates] in this idea of the 'common search'. . . . Neither knew the truth yet, but if only the other could be persuaded of this, they might set out together with some hope of finding it, or at least approaching it more closely. . . ." W.K.C. Guthrie, Socrates (Cambridge: Cambridge University Press, 1971), p. 129.

8. Examples of writers who portray Milton as the father of modern free speech are found in Francis Canavan, Freedom of Expression: Purpose as Limit (Durham, North Carolina: Carolina Academic Press, 1984), p. 159, n. 11. Canavan himself, however, does not view

Milton as a modern civil libertarian.

9. See John Milton, Areopagitica, Complete Prose Works of John Milton, 7 volumes (New Haven: Yale University Press, 1953-74), 2:565. Milton excludes from toleration "Popery and open superstition, which as it extirpats all religions and civill supremacies, so it self should be extirpat, provided first that all charitable and compassionat means be us'd to win and regain the weak and misled." Milton repeats his call to ban Catholicism elsewhere. See A Treatise of Civil power in Ecclesiastical causes (1659), where Protestants are permitted the right of "a free and lawful debate," but the "papist," whom Milton describes as the "only heretic," is barred from participation. Milton is even more vehement in Of True Religion, Heresie, Schism, and Toleration, where he states that Catholics should not be tolerated publicly or privately: "the exercise of their Religion, as far as it is Idolatrous, can be tolerated neither way. . . without great offence to God." Cited in Leonard Levy, Emergence of a Free Press (New York: Oxford University Press, 1985), pp. 95-96.

10. Complete Prose Works of John Milton, vol. 2, p. 551.

11. Roland H. Bainton, Erasmus of Christendom (New York: Crossroad, 1969), p. 3. On Erasmus as a humanist, see Brendan Bradshaw, "The Christian Humanism of Erasmus," The Journal of Theological Studies 33 (1982):411-447; James D. Tracy, "Erasmus the Humanist," Erasmus of Rotterdam: A Quincentennial Symposium, ed. Richard L. DeMolen (New York: Twayne Publishers, 1971), pp. 29-47; Albert Rabil, Jr., "Desiderius Erasmus," Renaissance Humanism: Foundations, Forms, and Legacy, ed. Albert Rabil Jr., 3 vols. (Philadelphia: University of Pennsylvania Press, 1988), 2:216-264. For a more general biography of Erasmus, including his humanism, see Bainton's Erasmus of Christendom and Cornelis Augustijn, Erasmus: His Life, Works, and Influence, trans. J.C. Grayson (Toronto: Univeristy of Toronto Press, 1991).

12. The five traditional humanistic studies are grammar, rhetoric, history, poetry, and moral philosophy. On defining Renaissance humanism, see Paul Oskar Kristeller, Renaissance Thought: The Classic, Scholastic, and Humanist Strains (New York: Harper and Row, 1961), pp. 9-10; Craig Thompson, "The Humanism of More Reappraised," Thought 52 (September 1977): 233.

13. As Paul Oskar Kristeller has observed, Renaissance humanism "must be understood as a characteristic phase in what may be called the rhetorical tradition in Western culture." Renaissance Thought: The Classic, Scholastic, and Humanist Strains, pp. 11-13.

14. Erasmus, Opus Epistolarum Des. Erasmi Roterodami (hereafter cited as EE), ed. P.S. Allen, H.M. Allen, and H.W. Garrod, 12 vols. (Oxford: Clarendon Press, 1906-57), 1:30. 1-3 (letter to John Botzheim, 30 January 1523). The truth of Erasmus's self-assessment is particularly apparent in his treatment of religion. In his Paraphrases of the New Testament, Erasmus rewrites Scripture in a style that will appeal to the masses, like "the farmer, the tailor, the mason," and even the disreputable, such as "prostitutes, pimps, and Turks." See Erasmus, Desiderii Erasmi Roterodami Opera Omnia (hereafter cited as LB), ed. J. Clericus,

10 volumes (Leyden: 1703-6), 7:Preface to the Paraphrase of St. Matthew (1520). See also Marjorie O'Rourke Boyle, "Weavers, farmers, tailors, travellers, masons, prostitutes, pimps, Turks, little women, and Other Theologians," Erasmus in English: A Newsletter Published by University of Toronto Press 3 (1971):1-7. Similarly, Erasmus writes his Ecclesiastes as a manual to instruct preachers in how to proclaim the word of God persuasively. LB 5:767-1100 (Ecclesiastes, sive de ratione concionandi, 1535).

15. Recents discussions of the humanist dialogue include: David Marsh, The Quattrocento Dialogue: Classical Tradition and Humanist Innovation (Cambridge: Harvard University Press, 1980); J.F. Tinkler, "Humanism and Dialogue," Parergon: Bulletin of the Australian and New Zealand Association for Medieval and Renaissance Studies 6 (1988):197-214; and K.J. Wilson, Incomplete Fictions: The Formation of English Renaissance Dialogue.

16. Most sixteenth-century reformers meant by nonessentials the indifference of rituals that are neither commanded nor forbidden by the divine law of the New Testament. Thus, they employed the idea of indifferent rituals to condemn Roman Catholicism for burdening the Christian conscience with man-made ceremonies. See, for example, Martin Luther, Werke (hereafter cited as WA), 58 volumes (Weimar: Hermann Böhlaus, 1883-1908; rpt. Graz, Akademische Druck-u. Verlagsanstalt, 1964-), 2:478 (Commentary on Paul's Epistle to Galatians, 1519); John Calvin, Institutes of the Christian Religion 3. 19. 10-12.

17. Classically, adiaphora referred to all external things and actions that were not decisive in the moral life of the wise man, but were (at least for the Stoics) to be judged by the end toward which they were directed. So that the adiaphoron (that is, the indifferent thing or act) could become either good or bad, depending on the person's inner disposition. The Christians adopted the term and applied it to externals--like food, drink, marriage, wealth, and so on--that were once regulated under the Old Law, but were now morally indifferent under the New Law, in the sense that the ethical status of these externals was to be determined by the actor's good or bad intentions. On the historical development of the concept "adiaphora," see Bernard J. Verkamp, The Indifferent Mean: Adiaphorism in the English Reformation to 1554, Studies in the Reformation vol. 1 (Athens, Ohio and Detroit, Michigan: Ohio University Press and Wayne State University Press, 1977), pp. 20-25.

18. Convivium religiosum (1522), The Colloquies of Erasmus, trans. Craig R. Thompson (Chicago: University of Chicago Press, 1965), p. 58, p. 61; Marjorie O'Rourke Boyle, Erasmus on Language and Method in Theology (Toronto: University of Toronto Press, 1977), p. 138.

19. LB 5:1265D-E (Diputatiuncula de taedio, pavore, tristitia Jesu, instante supplicio crucis: deque verbus, quibus visus est mortem deprecari, 'Pater, si fieri potest, transeat a me calix iste' [Little Disputation on the Dread, Fear, and Sadness of Jesus, when the Punishment of the Cross was pressing upon him and on the words with which he seemed to be averting death "Father if it can be done let this cup pass from me"]).

20. On the classical use of diatribē, see André Oltramare, Les Origines de la Diatribe Romaine (Geneva: Imprimeries Populaire, 1926), especially pp. 9-17, 116-125; Marjorie O'Rourke Boyle, Rhetoric and Reform: Erasmus' Civil Dispute with Luther (Cambridge: Harvard University Press, 1983), pp. 6-8. Erasmus, in Hyperaspistes I (LB 10:1313A), finds the origin of the diatribe in the battles philosophers had among themselves, "each for his own sect." See also Augustijyn's Erasmus: His Life, Works, and Influence, p. 137: "A diatribe is a treatise, known since Greek and Roman times, in dialogue form on a moral or philosophical theme."

21. E. Gordon Rupp and Philip S. Watson, eds., Luther and Erasmus: Free Will and Salvation (The Library of Christian Classics: Icthus Edition. Philadelphia: Westminster Press), pp. 84-85, p. 91.

22. "It is . . . essentially salutary and necessary for a Christian to find out whether the will does anything or nothing in matters pertaining to salvation. . . . If we do not know these things, we shall know nothing at all of things Christian, and shall be worse than any heathen." Ibid., pp. 116-117.

23. "The Holy Spirit is no Skeptic, and it is not doubts or mere opinions that he has written on our hearts, but assertions more sure and certain than life itself and all experience." Ibid., p. 109. See Boyle, Rhetoric and Reform, particularly pp. 43-66.

24. LB 9:1218B-C (De libero arbitrio). In LB 10:1663B (Spongia adversus adspergines Hutteni), Erasmus maintains that knowing "whether free will is important to salvation or whether faith alone contributes to salvation" are not articles of faith. See also Desiderius Erasmus, Collected Works of Erasmus (hereafter cited as CWE), still in progress (Toronto: University of Toronto Press, 1974-), 8:280. 358-360 (Letter to Pierre Barbier, 13 August 1521).

25. Luther and Erasmus: Free Will and Salvation, p. 37. Cf. CWE 27:118 (Praise of Folly): "For human affairs are so complex and obscure that nothing can be known of them for certain, as has been rightly stated by my Academicians [Academic Skeptics], the least assuming of the philosophers." Erasmus explains that his skepticism does not signal his indifference to the truth, but that he "will consider matters for a long while and will not rashly make a pronouncement. Therefore he is not a skeptic who cares not to know what is true and what is false, inasmuch as skeptics take their name from attentive observation. But rather a skeptic is he who does not make facile definitions, and does not engage in mortal combat for his opinion, but what another follows as a certain thing he instead pursues as a probable matter." LB 10:1262C-D (Hyperaspistes I). Erasmus's explanation of skepticism is etymologically correct, since the word "skeptic," literally "inquirer," derives from the verb σκέπτεσθαι, which means "to observe carefully," "to examine," and "to consider." See Charlotte Stough, Greek Skepticism: A Study in Epistemology (Berkeley: University of California Press, 1969), p. 3.

26. Luther and Erasmus: Free Will and Salvation, p. 106.

27. As Cicero explains: "And as to the fact that our school argues against everything, that is only because we could not get a clear view of what is 'probable,' unless a comparative estimate were made of all the arguments on both sides." Cicero, De officiis 2. 2. 8. See also Tusculan Disputations 2. 3. 9; Cicero, Academica 2. 3. 7-8. Cf. Aristotle Topics 101a 35-37, where Aristole writes that "the ability to puzzle on both sides of a subject will make us detect more easily the truth and error about the several points that arise." See also Alain Michel, Rhétorique et Philosophie chez Cicéron: Essai sur les Fondements Philosophique de l'art de Persuader (Paris: Presses Universitaires de France, 1960), pp. 158-173.

28. Boyle, Rhetoric and Reform, pp. 20-21, pp. 43-46; Luther and Erasmus: Free Will and Salvation, p. 47; LB 9:1220F (De libero arbitrio). Comparison, according to Erasmus, is what enables church councils to arrive at the truth: "Indeed in the church councils what is obscure for some the Spirit reveals to others, so that from a comparison of separate elements nothing remains obscure when each person brings forth what has been disclosed to him." LB 10:1312C-D (Hyperaspistes I).

29. Cicero, De inventione 1. 30. 47-49.

30. "So far we have compared those scriptural passages which establish free will and those, on the other hand, which seem to take it away completely. But since the Holy Spirit, who is their author, cannot contradict himself, we are forced, whether we like it or not, to seek a moderate judgment." LB 9:1241D (De libero arbitrio).

31. LB 9:1224C (De libero arbitrio); See Ibid. 1241C; LB 10:1327B-C (Hyperaspistes I).

32. De finibus 2. 6. 17; Tusculan disputations 1. 47. 112.

33. Although judicial oratory concerns past facts that are, in theory, ascertainable and could not be other than they were, the judicial genre still deals with matters that are, at least in the present, under contention. For while a past action either did or did not occur, proof of the action is ambiguous. Evidence, which is termed "inartificial proofs" in the rhetorical treatises, can be refuted: witnesses, documents, confessions extracted by torture, and so on are impeachable. See M. Fabius Quintilian Institutione Oratoria 5, chapters 1-7. And the arguments that the orator himself invents, the so-called "artificial proofs," rarely prove a case with certainty. There does exist a category of irrefutable arguments or "those which cannot be otherwise." See De inventione 1. 29. 44-45 and Quintilian 5. 9. 3-7. If these arguments predominated, however, there would be no dispute between parties. In addition to the uncertainty of legal proofs is the ambiguity of the law itself. Cicero states that "those cases which are such that the law involved in them is beyond dispute, do not as a rule come to a hearing at all." Therefore, the ambiguity of the law allows the orator "to find some authority in favor of whichever side he is supporting." Cicero, De oratore 1. 57. 241-242.

34. John Tinkler also observes that while Academic skepticism is generally characteristic of rhetoric, in judicial oratory the orator is not, himself, permitted to speak skeptically. In public, he is expected to argue, unambivalently, either for or against a position. See John F.

Tinkler, "Renaissance Humanism and the genera eloquentiae," Rhetorica: A Journal of the History of Rhetoric 5 (1987):295.

35. De oratore 2. 19. 78.

36. De natura deorum 1. 6. 14. See also Hirzel, Der Dialog, vol. 1, p. 531.

37. Cicero, despite his disdain for Epicureanism, concedes that he may be in error: "'many men, many minds'--so it is possible that I am mistaken." De finibus 1. 5. 15.

38. See, for example, Richard Tuck, "Scepticism and toleration in the seventeenth century," Justifying Toleration: Conceptual and historical perspectives, ed. Susan Mendus (Cambridge: Cambridge University Press, 1988), p. 25: "Given that the truth of religious or moral beliefs is a matter of indifference to the sceptic, but given also that this detachment is a very unusual mental attitude, what is the sceptic to do about the beliefs held in his society? Montaigne and Lipsius continually emphasised (as Descartes in his sceptical mode was to do later) that the wise sceptic must abide by the public requirements of his society, both in morality and religion. To oppose himself to them would both be to take their truth value seriously, and also to run a direct physical risk to his own serene existence."

39. Luther and Erasmus: Free Will and Salvation, p. 97.

40. See above, note 3.

41. CWE 9:252. 232-234 (Letter to Jean de Carondelet, 5 January 1523). See also Ibid. 250. 172 - 251. 188; 253. 244-246.

42. LB:10 1335C (Hyperaspistes I). See also CWE 7:126. 235-245 (Letter to Jan Šlechta, 1 November 1519).

43. According to Erasmus, the following doctrinal debates concern adiaphora:

> how person differs from person, and why the bringing forth of the Holy Spirit from the Father is called procession not generation; and whether the divine essence generates or is generated; and whether the divine essence has the same identity in connection with no matter which person of the Trinity, as the divine essence has in connection with the divine being Itself. And whether the power of generating in the Father be absolute or relative; and whether the power of generating can be imparted to the Son by the Father. Moreover, if it is conceded that God generates God, whether God generates the selfsame God or another God.

LB 10:1259F-1260A (Hyperaspistes I, 1526).

44. LB 6:696C-D (Note on I Cor. 7:39, Novum Testamentum, 1519); CWE 9:264. 649-651 (Letter to Jean de Carondelet, 5 January 1523); LB 10:1663A-B (Spongia adversus adspergines Hutteni, 1523); LB 6:926-928 (In Epistolam ad Timotheum I); Ausgewählte Werke, p. 193, lines 9-28 (Ratio verae theologiae); LB 5:1079B (Ecclesiastes); CWE 66:11,

cited in Augustijn, Erasmus: His Life, Works, and Influence, pp. 78-79.

In a letter (1 November 1519) to his friend Jan Šlechta, Erasmus summarized what he believed to be the fundamentals: "[A] few truths are enough, and the multitude are more easily persuaded of their truth if they are few. As things are, we make six hundred articles out of one, some of them of such a kind that one can be ignorant of them, or unconvinced, without peril to one's religion. . . . Besides which the whole of the Christian philosophy lies in this, our understanding that all our hope is placed in God, who freely gives us all things through Jesus his son, that we were redeemed by his death and engrafted through baptism with his body, that we might be dead to the desires of this world and live by his teaching and example, not merely harboring no evil but deserving well of all men. . . .

These above all are the things that must be implanted in the hearts of men until they become second nature. If any man wishes to pursue more abstruse questions touching the divine nature or the substance of Christ or the sacraments . . . he is welcome to do so with this restriction, that to believe what commends itself to this man or that should not at once become compulsory for everybody." CWE 7:126. 235 - 127. 260 (Letter to Jan Šlechta, 1 November 1519). See also Bainton, Erasmus of Christendom, pp. 185-186; Joseph Lecler, Toleration and the Reformation, trans. T.L. Westow, 2 vols. (New York: Association Press, 1960), 1:126-27; and Craig R. Thompson, Inquisitio de Fide, rev. ed. (Hamden, Connecticut: Archon Books, 1975), pp. 39-48.

45. As Erasmus writes: "the more dogma there is, the more material for heresy." EE 5:465. 1 - 468. 155 (Letter to William Warham, 1 June 1524). See also Erasmus of Christendom, p. 185. On the Arians, Erasmus writes: "Some passages in Holy Scripture gave the appearance of supporting [the Arian position], and rational arguments were not lacking which displayed some semblance of truth." CWE 9:261. 526-536 (Letter to Jean de Carondelet, 5 January 1523). The Nicene Creed was formed to exclude Arianism, since the earlier Apostles' Creed did not.

46. LB 9:1059E (Apologia adversus Monachos quosdam Hispanos, 1528). See also Wallace K. Ferguson, "The Attitude of Erasmus Toward Toleration," Persecution and Liberty: Essays in Honor of George Lincoln Burr (New York: The Century Company, 1931), pp. 177-179; Manfred Hoffmann, "Erasmus and Religious Toleration," Erasmus of Rotterdam Society Yearbook Two (1982), pp. 105-106.

47. "Like those people who drag others to the flames for any error at all, those who think that the civil power lacks any right to kill heretics are wrong." LB 10:1576B-C (Epistola contra quosdam qui se falso jactant evangelicos). See als EE 5:604-606. Although Erasmus never explicitly calls for the execution of any specific heretic, he writes that "the Anabaptists should in no way be endured," implying that he agrees with imperial legislation that prescribed the death penalty for Anabaptists. Epistolarum Des. Erasmi libri xxxi (London, 1642), Ep. 77, col. 1963D.

48. Bainton, Erasmus of Christendom, p. 257.

49. Cicero, Orator 22. 72.

50. Orator 35. 123.

51. Quintilian 3. 4. 15. Cicero writes that "every one must acknowledge that of all the resources of an orator far the greatest is his ability to inflame the minds of his hearers and to turn them in whatever direction the case demands. If the orator lacks that ability, he lacks the one thing most essential." Cicero, Brutus 80. 279. See also Ibid. 93. 22; Orator 36. 127.

52. Quintilian 5. 14. 29.

53. De oratore 2. 42. 178. Quintilian adopts Cicero's preference for pathos over logical proof. In a passage that seems to justify the most damning critics of rhetoric, Quintilian (6. 2. 5-6) recommends emotional appeals for their unique ability to deceive, when judges "and their thoughts have actually to be led away from the contemplation of the truth.

> . . . and just as lovers are incapable of forming a reasoned judgment on the beauty of the object of their affections, because passion forestalls the sense of sight, so the judge, when overcome by his emotions, abandons all attempts to enquire into the truth of the arguments, is swept along by the tide of passion, and yields himself unquestioning to the torrent.

See also Brian Vickers, In Defence of Rhetoric (Oxford: Clarendon Press, 1988), pp. 76-78.

54. Quintilian 12. 1. 1.

55. Tusculan Disputations 2. 1. 4; Plato Republic 494a.

56. Luther and Erasmus: Free Will and Salvation, p. 36.

57. LB 5:858E-859A, 870D-881C (Ecclesiastes). See James Michael Weiss, "Ecclesiastes and Erasmus: The Mirror and the Image." Archiv für Reformationsgeschichte 65 (1974):100-101; John O'Malley, "Content and Rhetorical Forms in Sixteenth-Century Treatises on Preaching," Renaissance Eloquence: Studies in the Theory and Practice of Renaissance Rhetoric, ed. James J. Murphy (Berkeley: University of California Press, 1983), p. 244.

58. Tusculan Disputations 4. 25. 55.

59. De oratore 1. 59. 255; De officiis 1. 1. 3.

60. Luther and Erasmus: Free Will and Salvation, p. 96.

61. Aristotle established, and subsequent rhetoricians have accepted, three modes of persuasion: ethos, pathos, and logical proof: "Of the modes of persuasion furnished by the spoken word there are three kinds. The first kind [ethos] depends on the personal character of the speaker; the second [pathos] on putting the audience into a certain frame of mind; the third on the proof, or apparent proof, provided by the words of the speech itself (Rhetoric 1356a 1-4)." Ethos persuades when "the speech is so spoken as to make us think [the speaker] more credible, [since] we believe good men more fully and more readily than others

(1358a 3-13)." Pathos succeeds "when the speech stirs the emotions," for "our judgments when we are pleased and friendly are not the same as when we are pained and hostile (1356a 13-19)." Logical proof works "through the speech itself when we have proved a truth or an apparent truth by means of the persuasive arguments suitable to the case in question. (1356a 19-21)." The original Aristotelian sense of ethos, however, changes under the Romans, and it comes to mean a gentler form of the emotions roused by pathos. Cicero, in Orator, contrast ethos, which is "courteous and agreeable, adapted to win good will," with pathos, which is violent, hot and impassioned (36. 128)."

62. "In discussion it is not so much weight of authority as force of argument that should be demanded. Indeed the authority of those who profess to teach is often a positive hindrance to those who desire to learn; they cease to employ their own judgement, and take what they perceive to be the verdict of their chosen master as settling the question." De natura deorum 1. 5. 10. See also Tusculan Disputations 2. 26. 63.

63. LB 10:1305F (Hyperaspistes I).

64. Tusculan Disputations 5. 15. 43.

65. Tusculan Disputations 4. 28. 61; 4. 21. 47-48. Of all the passions, it is anger, in particular, that Cicero singles out for opprobrium. He does so because anger, more than any other emotion, undermines rational reflection: "nothing can be done rightly or thoughtfully when done in anger." De officiis 1. 38. 136. Translation from On Duties, eds. M.T. Griffin and E.M. Atkins. See also Tusculan Disputations 4. 23. 52. That anger is inappropriate to conversation, however, does not exclude it from public oratory. Anger and allied "negative" emotions like hatred, ill-will, fear, and so on, are acceptable tools for the orator in persuading his mass audience. De oratore 2. 44. 185; 189-190. Quintilian states (6. 2. 20) that "pathos is almost entirely concerned with anger, dislike, fear, hatred, and pity." Their exclusion from philosophical dialogue like the ban on appeals to authority, is the result of dialogue's separate rules of decorum.

66. Academica 2. 3. 9; De natura deorum 1. 6. 15; Michel Ruch, Le Preamble Dans Les Oeuvres Philosophiques De Ciceron: Essai sur la Genese et l'art du Dialogue (Paris: Belles Lettres, 1958), pp. 80-82; Introduction to Loeb Classical Library edition of De finibus, trans. H. Rackham, p. xvi.

67. See Colloquies, p. 49; p. 78; Lawrence V. Ryan, "Erasmis Convivia: The Banquet Colloquies of Erasmus," Medievalia et Humanistica: Studies in Medieval and Renaissance Culture, new series 8 (1977):205; Boyle, Erasmus on Language and Method in Theology, p. 139.

68. See John A. Hostetler, Amish Society (Baltimore: The Johns Hopkins University Press, 1990), pp. 33-41, 86-89; Donald B. Kraybill, The Riddle of Amish Culture (Baltimore: The Johns Hopkins University Press, 1989).

69. Luther and Erasmus: Free Will and Salvation, pp. 36-37; LB 10:1287C (Hyperaspistes I). In contrast to Diatriba, Erasmus's stance in Hyperaspistes--responding to Luther's combative De servo arbitrio--is more contentious. See, for example, LB 10:1312A; 1364D-E.

70. In the République, Bodin developed a theory of absolute sovereignty, which he hoped would undermine Huguenot arguments for a right of resistance.

71. For a summary of Bodin's religious life and views, see Colloquium of the Seven about Secrets of the Sublime, pp. xv-xlvi.

88. Ibid., p. 167.

89. Ibid., pp. 169-170. Octavius further observes: "The edicts of the Persians and the Turks also warned that no discussions about religion may be carried on. Also the kings of the Muscovites and the princes of the Germans at a great assembly at Augsburg, after destructive and lengthy wars, proclaimed that there would be no more discussion about religion among Catholics and priests of the Augsburg confession. When one man rashly violated this edict, he was put to death, and the uprisings in that city were quelled to the present (p. 167)."

90. Ibid., p. 170.

91. Ibid.

92. Ibid., p. 205.

93. Tellingly, Bodin casts Fridericus as the speaker fooled by artifical apples that Coronaeus had mingled with their real counterparts:

> When Fridericus, good man that he was, bit into an artificial apple, being deceived by its appearance, he said: 'I do not see how any one of you could have not been deceived.' After the others looked more closely at the apples which were so cleverly fashioned that they seemed freshly plucked, Coronaeus said: 'If the eyes which are the keenest of the senses are so irrationally deceived in insignificant matters, how can it happen that the mind, which gathers everything from the senses, attains certain knowledge in difficult and sublime matters?'

Bodin thus uses Fridericus to make the skeptical point that reality and appearance are often indistinguishable. Ibid., p. 233.

Abstract

The relationship between time locale and presidential success is investigated with a time-sensitive logit model based on nonconsensual House and Senate floor votes from 1953 through 1986. Capital assets (presidential approval, seat share by partisans, economic conditions) are related to success. The specific time locale, including the honeymoon period in the first six months of the first presidential term, is not related to success except insofar as capital assets are more concentrated at one time locale than another.

What Difference Does the Calendar Make?
Changes in Presidential Capital and Success over Time

Presidential successes and failures with Congress are a function of time. Before systematic measurement of floor success in Congress began with the first Eisenhower term, earlier chief executives such as Wilson and the second Roosevelt enjoyed great policy success early in their respective first terms. Later on, both came to grief as the commonplace legislative reaction
coalitions took command and inflicted major defeats upon these able leaders. Since 1953, presidents have often enjoyed notably greatest success in the first term's first year, and notably least in the second term's last. This is evident at a glance for Johnson in 1965 v. 1968 as well as Reagan with 1981 v. 1988.

The presidential honeymoon is the roughly six-month period of a new administration when the new administration enjoys a muting of criticism from the Washington community. Like the real honeymoon, such suspended judgment is decidedly temporary.[1] With passage of time comes the inevitable hard judgments from elite media and legislative sources. Thus all new presidents are counseled to "hit the ground running" (Pfiffner 1988, 7) with a well-developed policy agenda and legislative lobbying strategy lest a unique opportunity be irretrievably lost. The complementary opportunity for presidential agenda rivals is the lame duck period, circa 1959-60 after adoption of the Twenty-second Amendment. Speaker of the House Jim Wright, for instance, moved the 100th House to numerous actions in reversal of Reagan positions during that President's final two years of 1987-88.[2] For presidents, some years are better than others.

Some presidential months are also better than others. The president's standing with the public, typically called 'public approval' or by the less accurate term 'popularity,' varies widely over a few weeks or months. This indicator is almost universally recognized in

---

[1] Exact length of the honeymoon is slightly disputed. Brody 1991, 32, uses the first seven months as a standard honeymoon indicator. This is approximately the point at which the initially high ratio of approval to disapproval rating shows significant decay, probably due mostly to replacement of "no opinion" by disapproval. See also Brace and Hinckley 1991, 1003. But honeymoons prove empirically to be of varying length (Edwards with Gallup 1990, 123-128). Six months now takes a president to July 20, almost the outset of the annual August congressional recess.

[2] More generally, Brace and Hinckley (1992, 212, f. 10) show bivariate correlations of averaged annual approval and annual success rates from all CQ roll calls with presidential position. They show strong correlations the first two years (.728 in Year 1 and .721 in Year 2) followed by difficulty (.325 in Year 3, -.603 in Year 4).

Washington and is widely accepted as a sign of presidential potency.[3] At the conclusion of the successful March 1991 Desert Storm land offensive, President Bush basked in an historically high 89 percent Gallup-measured approval rating after this most recent of "a succession of rally events" (Kernell 1993, 159) during his term. When the President subsequently failed to use this occasion to press Congress for his domestic and economic policy initiatives, the Washington community interpreted this oversight as an important lost opportunity. On foreign policy where the President held firm convictions and resolve to act, high approval did make his action credible to members of Congress. Kernell gives a brief account of President Bush threatening to go public to explain a planned veto of a $10 billion U.S. loan guarantee to Israel (Kernell 1993, 157-158). Bush's approval share was approximately 70 percent--and one House member concluded "there was very little stomach to confront the President on this (Kernell 1993, 158)." The President played defense forcefully, preventing the pro-Israel congressional majority from sending the loan bill to his desk. Presidential popularity is a resource, but one that must be used quickly before it departs.

Low presidential approval is just as meaningful to Washington as high approval. Simon and Ostrom (1988, 745) have said "The president's approval score, as the foremost indicator of prestige, is a vital piece of information that operates to shape the perceptions of Washington decision makers and make them susceptible to persuasion." Or nonsusceptible. When the President undertook belated economic policy initiatives in late November and December 1991, that was too late, for his approval rating by then was 50 percent (and slipping) as the public and elite media put Iraq behind them and shifted attention to unemployment, slow economic growth and the national deficit. Roger Davidson said "It's amazing what falling poll ratings will do. Once Bush's popularity plummeted, there was even less incentive for Congress to work with him (quoted in Donovan 1992)."

A model meant to capture how well or poorly a president does on congressional floor voting must be attuned to the time locale of those votes. The experiences of 1991 and 1992 show that it takes little time for the Washington media to shift focus from one issue set to another--bringing much of the attentive public along with it (Iyengar and Kinder 1987; Edwards, Mitchell and Welch 1992). Rally events come and go. A scandal may arise. Surely a president may be better positioned to win on the floor in one month than an adjacent one.

---

[3] Lyndon Johnson regularly carried clippings of public and privately commissioned polls showing his high approval ratings, to display and boast of them at every meeting with a significant Washington figure. He believed, as Woodrow Wilson put it, that "Let him once win the admiration and confidence of the country, and no other single force can withstand him, no combination of forces will easily overpower him." But when dire troubles did overtake Johnson, none among his efforts at shoring the ratings or dismissing them was effective. See Altschuler 1990.

Approval is one among several presidential assets which are sensitive to passage of time. Paul Light (1991) defines presidential power in Congress in terms of presidential resources. Resources are assets which can convert into congressional support and enhanced likelihood that a president will prevail in a contest. Light distinguishes between a president's internal resources of time, information, expertise and energy (Light 1991, 16-25), and external ones which produce a certain global impression by other Washington actors of the president's political capital (Light 1991, 14-15, 25-33). Capital is the basic indicator of the president's political strength; Light names the president's congressional party support, public approval rating, electoral margin, and professional reputation as components of this capital. Capital is there to be spent by presidents on legislative accomplishments.

Internal resources are obviously scarce and precious to every administration. Less obviously, capital has even greater value but comes as a fragile package. Light (1991, 33) argues that "Much like time, presidential capital does not keep" since it must be expended with policy choices and is not fully replaceable. This is the basis of Lyndon Johnson's famous January 1965 harangue to his White House staff. With 16-million vote plurality and 69 percent approval rating at hand, the President insisted nonetheless that every possible Great Society measure must be passed, and quickly, because "I've already lost about three of those sixteen and am probably getting down to thirteen. If I get into any fight with Congress, I will lose another couple of million, and if I have to send any more of our boys into Vietnam, I may be down to eight million by the end of the summer (quoted from Leuchtenburg 1983, 149)." For good reason this President felt a strategic rather than psychic imperative for haste.

The Calendar and Ambition

Presidential ambition is greatly influenced by the extraordinarily regular American political calendar. One illustration is first term--first year ambition to push a large agenda, something President Clinton has clearly shown in his maiden voyage. It is so regular that presidents mark their own launching by a new term's start even when they have done earlier interim service. Lyndon Johnson's forceful "honeymoon marker" of January 1965 came more than one year after he became president. The honeymoon or a close cousin existed despite the de facto age of his administration.

Johnson was particularly determined to justify his extraordinary drive for legislation. His motive was less personal than strategic, and his strategy revolved on the president's political calendar. Late in July 1965 after failing to win congressional assent to District of Columbia home rule following a violent and bruising White House lobbying campaign, the President told legal counsel Harry McPherson:

> You've got to give it all you can, that first year. Doesn't matter what kind of majority you come in with. You've got just one year when they treat you right, and before they start worrying about themselves. The third year, you lose votes; if this war

> goes on, I'll lose a lot of 'em. A lot of our people don't belong here, they're in Republican seats, and the Republicans will get them back. The fourth year's all politics. You can't put anything through when half the Congress is thinking how to beat you. So you've got one year ...(McPherson 1988, 268).

This was more than rationalization by one who picked a congressional fight and lost. Despite his penchant for exaggeration and outright lies elsewhere, here Johnson makes a credible witness. He sincerely believed that capital was meant to be used to pass bills, would not keep in any event, and had to be used early before it ebbed away.

The practical upshot is that all presidents are supposed to move forcefully at the start. Before and after Johnson, Kennedy and Nixon counselors urged that their presidents move quickly (Pfiffner 1988, 7). More recently, Reagan Budget Director David Stockman called for a "legislative blitzkrieg" early in 1981 before the normal bureaucratic and interest group forces recovered and resisted. President Clinton is currently being criticized for seeking to do too much, rather like Carter in 1977. Nonetheless Light (1991) says counseling an early start is realistic. He coins the term 'cycle of decreasing influence' to describe "declines in presidential capital, time, and energy (1991, 36)" which visits every chief executive even though passage of time also brings increasing expertise, expressed in a 'cycle of increasing effectiveness' (Light 1991, 37). Presidents such as Kennedy, Carter and Clinton learned a lot about Congress, especially in the first year! But legislative clout inheres less with internal resources than in the largely external capital. Thus when knowhow finally is there, the necessary capital is reduced.

As a result we should expect to find a larger presidential agenda in the first year than in other years. On the congressional floor this translates, ceteris paribus, into a larger number and variety of voting contests in first years than others. We should also anticipate that any increase in the size of an agenda produces a reduced likelihood of passage of any given item in that list. Presidential internal resources are stretched thinner with an increase of agenda size, reducing the average investment of available skill, time and knowledge per measure. The limit on resource allocation extends not only to the White House per se, but to legislative allies. The party leadership and committee chairs in the 89th House and Senate (1965-66) were hard put to sustain high-quality coalition making activities. White House head counting in the Johnson era became considerably worse as 1965 and 1966 wore on, reaching a nadir in a series of avoidable June 1967 embarrassments. The time and energy needed for thorough head counting is considerable. Slipshod work can often be traced to agenda overload. Finally, an enlarged agenda is likely to include bills of lesser quality or preparation--even "half-baked items" in the words of one Johnson aide viewing the expansive 1965 Johnson agenda. For all these reasons, ambition is both costly for a president and is most likely to impose its cost in the first year of the first term.

The fit between presidential ambition to pass an agenda, and success on the congressional floor, is uncertain. The congressional floor is locus of other ambitions as well. All strategic

agenda-promoting actors know space on the floor is scarce and precious. Every floor vote is an opportunity to put a bill before the president for signature, but there are severe limits to how many can be done in a session. This is true even though electronic voting and adoption of record voting on House amendments dramatically increased the number of recorded votes during the 1970s (Smith 1989).

On the floor, presidents must play not only offense but defense. A hallmark of 1970s reformism is the opening of doors for an enlarged host of policy activists (inside and outside Congress itself) to take their concerns to the floor. Liberals and conservatives alike displayed creative ingenuity in using the floor. With divided government also the usual norm since 1969, presidents have routinely been obliged to fashion defensive positions. The War Powers Resolution of 1973 and Speaker Carl Albert's cherished Budget and Impoundment Control Act of 1974 were both institutional responses to the confrontational positioning of an aggressive minority President. After Nixon, President Ford relied very heavily upon veto threats and actual vetoes, as did President Bush in his recent term.[4] Even President Reagan was largely reduced to saying nay and using the veto in 1987 and 1988 against the disrespectful and ambitious Speaker Jim Wright.

Even pre-reform era presidents often had to shift to defensive positions. Eisenhower vigorously fought the Bricker Amendment as a breach of constitutional foreign policy authority vested in the President; he also found others such as Senate Majority Leader Lyndon Johnson controlling the content of civil rights measures (Mayer 1989). Kennedy found frequent conservative initiatives from the South in the path, not to mention others imposed by Democratic power brokers from finance committees such as House Ways and Means Committee chair Wilbur Mills and Senate Finance Committee member Robert Kerr. Johnson was pure offense, yet he had to defend regularly and hard in 1967 and 1968 against conservative coalition reaction on matters of taxation, poverty, race and civil disorder. And Nixon's early ambitions for a negative income tax and welfare overhaul were thwarted by liberal Democrats, many of them reformists itching to assume policymaking dominion once the Johnson White House was gone.

When presidents confront a long list of floor votes against which to defend, the result again is a likelihood of lessened success on any given vote. As with the president's own agenda, a larger number of votes per session means a reduced allocation of scarce internal assets per vote. Combining agendas from all sources which produce votes of interest to the president, this variable is labeled 'agenda size' and is measured simply as the annual number

---

[4] President Ford issued 61 public bill vetoes with 12 overrides in only 29 months holding office. Kennedy, Johnson, and Nixon had combined for only 62 vetoes in 163 months (Rohde and Simon 1985, 399). More recently, George Bush vetoed 46 bills (one override) in 48 months. Rohde and Simon (1985) show that incidence of vetoes is strongly related to the president's share of party seats in Congress. Light (1991, 112-115) shows that Ford vetoes were part of a deliberate strategy based upon the President's severely limited political capital.

of nonconsensual roll calls per session of Congress.

The net result is that the pure count of nonconsensual votes which require some significant allocation of presidential resources is a potentially important determinant of success on any given vote. The next section outlines how presidential success is measured on the congressional floor.

Going to the Floor

The dependent variable of presidential success is measured from congressional record voting where Congressional Quarterly has recorded a Presidential Position, and where a meaningful minority position is reflected in the floor vote. This set of votes is hereafter cited simply as 'the floor.' Roll call voting gets a full share of criticism. One claim is that the floor is simply not the appropriate place for judging whether a president has, on balance, won or lost. The past and present reliance on floor voting is admittedly a consequence of Congressional Quarterly's diligent tracking of presidential positions on those votes--which means convenience and access to data prevail over more subtle grounds for choosing this forum to examine.

The view here is that the floor is well worth defending. However, anyone reliant upon this forum should ask whether the floor suits their questions. In this respect the floor inherently holds certain important drawbacks as well as benefits.

One drawback is that the floor does not accurately represent a president's issue agenda. Thus Light (1983, 1991) uses OMB records and interviews to construct a more valid basis for profiling that agenda. Similarly, Peterson (1990) by reconstructing an improved and updated list of presidential domestic legislative proposals, avoids reliance upon floor voting. There is little doubt that anyone seeking to isolate and give quantitative treatment to the president's agenda does well to avoid the floor. The floor is anything but pristine, instead resembling a stew or potpourri, even the colorful 'garbage can' (see Kingdon 1984) into which all interested participants pour their policy proposals.

The floor is a poor proxy for the agenda of any single entity, White House or otherwise. But presidential success in Congress is never simply a White House-controlled outcome in the first place. The floor is excellent for observing the competitive positioning of participants in response to the combined agendas of all significant players. Presidents who play obligatory defense must regularly promote their own agendas and defend simultaneously against rivals. And they may pick and choose things to support from among allies, temporary confederates, or even the occasional unwitting adversary.

The floor is also criticized as a biased subsample of everything Congress does. This criticism is obviously telling in that committees regularly censor out the great majority of proposals that enter their doors. If the floor has a potpourri of materials, they have nonetheless been thoroughly sifted before admission. That means agenda items about which

the president cares deeply may never be represented there.

Covington (1987) therefore speaks against the traditional reliance upon Congressional Quarterly's judgment of presidential positioning. He notes that the Kennedy and Johnson White House Office of Congressional Relations sometimes deliberately kept quiet about a presidential position, causing CQ not to register it among its floor vote list. This occurred about 10 percent of the time among contested House of Representatives roll calls for the 1961-67 period.

It is true that CQ-based floor voting did not succeed in picking up these, and no doubt other, 'hidden hand' positions. Short of having comprehensive legislative officers' archival records from which to reconstruct a valid running record, that problem admits of no current solution.

Another and more forceful Covington rejection of CQ voting data comes with his demonstration that CQ floor votes are loaded with one-sided consensual votes which congressional relations officers derided as inconsequential (Covington 1986, 724-725). The resultant loading biases voting bloc support data by improving the scores of regular opponents, which did not charm Kennedy/Johnson officers and left them resolved to separately compile their own sharpened data.

It turns out this criticism is easily remedied without abandoning Congressional Quarterly. The selection against consensual voting in Edwards (1989), Bond and Fleisher (1990) and elsewhere all do the job nicely even though they do not restore hidden White House positions. A duplication of Covington's OCR-derived 1961-67 presidential support scores for Republicans, Northern Democrats, and Southern Democrats resulted in scores almost identical to OCR in each instance (Renka 1991). Covington does not provide sufficient reason to give up on the nonconsensual vote source compiled by Congressional Quarterly.

In the final analysis, the floor defends itself as a data source, for what happens there is tremendously important. It is a generally accepted forum in the press for profiling whether the president has prevailed or not. Scholars do not deny the value of carefully studying the floor, no matter how clearly there is a concurrent need to better understand other facets of Congress. One of the most compelling reasons for getting systematic data on presidential positioning in legislative committees, is that we could use it to estimate better models of what happens in the next (floor) stage. It does entertain most major proposals of serious consequence for the White House, whether those were on its original agenda or not. It is a suitable place to measure presidential success if we accept that no one agenda is exclusively represented.

Floor success is represented by the annual proportion of victories among all votes with meaningful competition and a presidential position. The probit or logit analogue to the familiar annual success rate is the likelihood of presidential victory on any given roll call. This permits isolation of variables at a specific time.

Which floor votes should be included for evaluation? The key is to exclude the numerous one-sided 'consensual' vote outcomes (Rohde 1991, 200, f. 22) since they require no commitment of resources specific to that vote (although related previous or later votes may do so). They are also distributed quite unevenly over time, with larger numbers during the Johnson and Nixon period than elsewhere, with large numbers in presidential first-year Senate votes such as 1989 due to nominations, and with a disproportionate share of presidential winners except for Reagan in the House (Renka 1991). All of them should be excluded for purposes of testing agenda crowding or other indicators based theoretically upon presidential commitment of capital. The reduced question becomes which ones to exclude.

This paper concentrates upon the tripartite division of Congress into voting blocs, the Democrats being divided by region with Southern Democrats those from the eleven onetime Confederacy states. Hinckley (1981) identifies a pre-coalition voting bloc as one aligned and voting together by at least 75 percent of its members. If all three blocs vote together by 75 percent or more each, that is excellent evidence of a 'consensual' vote. These are excluded from the calculations to follow.[5] Remaining is a data set consisting entirely of roll call votes with presidential position and an appreciable minority position represented within at least one voting bloc.

Ideology, Party and Voting Blocs

Political ideology has received enough emphasis as a primary determinant of presidential success to warrant careful review. The view here is that personally held political belief systems are important factors in legislators' response to votes with presidential positions. But there is currently not a satisfactory way to measure it for use as an independent variable when the dependent variable, presidential success in this case, is measured from floor voting. The essential reason is that ideology itself is defined through floor voting. Following illustration of that, an alternative formulation of a variable is proposed.

Jon Bond and Richard Fleisher have done extensive work on determinants of presidential success on the floor in their 1990 book, The President in the Legislative Arena, and subsequent work (Fleisher and Bond 1992). Its conclusion is that presidential success is largely a congressional product determined primarily by the two members' attributes of political party, and ideology. Little controversy inheres in the former claim, but the latter invites strong disputes.

---

[5] Bond and Fleisher (1990) use a similar exclusion standard of dropping votes where the minority vote is 10 percent or less than the majority. However, "we leave near unanimous presidential losses in the analysis on the ground that the president's disagreement has injected conflict into the decision (1990, 70)." It may impart symbolic meaning, but not commitment of resources. The number of such votes also varies widely once the 1980s are profiled, with most from the Reagan and Bush period. Therefore the Bond and Fleisher approach is not followed here.

Ideology refers to a personally held political belief system of legislators. Bond and Fleisher (1990, 241-42) adapt ideological measurement from Keith Poole's well-known study of ideological interest group evaluations of U.S. Senators. Poole's spatial analysis found that about 80 percent of variance between Senators and interest groups on a given dimension was accounted by the classic liberal\conservative ideological factor (Poole 1981, 52). The two standard-setting interest groups, ADA and ACA for liberal and conservative counterparts, have long positioned themselves on comparable sets of ideological floor votes to establish closely comparable vote-based lists of where legislators stand on this one-dimensional spectrum. Since each group is both highly and consistently ideological over a long timespan (Poole 1981, 56-58; Poole and Daniels 1985; Poole and Rosenthal 1991) members of Congress who measure consistently the same on both group indices over time attest to a striking consistency and stability in casting of floor votes. Very recent studies continue to affirm voting consistency as a fundamental element of congressional careers (Hibbing 1993, 74-76).

Poole recommends inclusion of another ideological vote-based indicator to complement the ADA-ACA indices. This is the well-known Conservative Coalition Support Score from Congressional Quarterly. Modified to count only recorded yea and nay votes in the denominator, it records a very high voting consistency of Senators for a decade beginning in 1969 (Poole 1981, 58). Bond and Fleisher eschew this measure as a complement to the ADA/ACA because it is purely defined by the behavior of the members, whereas ADA/ACA defines ideology by "some a priori criteria" (1990, 241).

Since Bond and Fleisher wish to establish ideological positioning among presidents and members of Congress, the ADA/ACA measure is used to divide the liberals from the conservatives (1990, 164-165). To avoid using the very same votes from which ADA/ACA establish their annual ideological indices, "we purged votes on which the president expressed a position from the list of votes selected by ADA and ACA and reconstructed liberalism scores for members of Congress from 1953 to 1984 (1990, 241)."

The imposing shows of unidimensional voting consistency, complete with explanation rates of .80 or better, give the very grounds for doubting that this solves anything. The elementary problem of applying such analysis to presidential success on the floor is that those outcomes are measured on the same set of roll call floor votes from which the ADA and ACA indices are derived. If voting is indeed so consistent, then we should expect that whatever indicator we obtain from a subset of those votes will ably predict or retrodict the parent set or another subset. Bond and Fleisher purge a subset of ADA/ACA votes, but the remainder are extremely likely to closely resemble what has departed. Recalculated members' ideological scores are not likely to change much, if at all. The vaunted voting consistency of members applies across various subsets of roll call votes in a given year. Even a cursory examination of presidential-position roll call outcomes reveals very similar outcomes to all the rest. For instance, Collie (1988) profiles incidence of conservative and partisan coalitions on all House roll calls, finding a peak in the former and nadir of the latter in the early 1970s. A review of presidential position votes since 1953 demonstrates almost

exactly the same pattern (Renka 1991, 5-6).

Jackson and Kingdon (1992, 808-809) point out that "Use of these scales to represent representatives' ideology in a model of their voting behavior turns out to be simply a tautology. It is explaining votes with votes. The problem is that the interest group score, the explanatory variable, and the votes being modeled, the dependent variable, are almost certain to be tapping the same or related dimensions (pp. 808-809)" so long as votes are largely unidimensional. Thus "it simply shows that voting is consistent (p. 809)." Besides, floor voting is not the place to find personal beliefs systems at work. Jackson and King (1989, 1162, f. 2) reject the ADA/ACA and other proxy measures of ideology because ideology is a guide to establishing a personal preference. Voting on the floor reflects a varied mix of personal preferences and constant external pressures such as party, constituency, and colleagues. That introduces systematic error into measuring personal preference: "Worse still, these errors are not white noise but contain systematic biases. Inclusion of a vote score variable with these systematic errors will bias coefficients estimating the independent effects of party and constituents, as well as of ideology (Jackson and King 1162, f. 2)." The floor-derived ACA/ACA measure is unsuitable for explaining presidential success on the same congressional floor.

It is not necessary to use the ADA/ACA or other ideological proxies to capture a strong element of political beliefs represented in members' floor behavior. To the extent political ideology is expressed through the mixed indicator of floor voting at all, it reflects partly in party label, and otherwise in the historic North-South division of Democrats which has been such a dominant element of congressional coalitions on the floor since the 1940s. That division captures much of the mix of personal, partisan and constituency pressure that governs floor voting. Instead of including ideology and party as separate factors by dividing each party into its vote-derived liberal and conservative wings, one can instead divide the Democrats into the familiar Northern and Southern wings and treat the Congress as a de facto three-party system.

Poole and Rosenthal (1991) show that historic congressional voting displays a predominant major dimension with an occasional strong second dimension. One of those appears in the 1940s with the 77th Congress and continues through the 1960s. This robust second factor is the race issue shown in the highly separate anti-civil rights issue voting of virtually all Southern Democrats until the late 1960s. Not surprisingly, the 77th Congress was long ago identified in Key's Southern Politics (1949) as a wellspring of conservative coalition appearances on the floor. Such an alignment running right across a party boundary suggests the traditional regional division with separate Southern Democrats is a useful one.

In this paper, the eleven-state Old Confederacy alignment of SDs is adopted. With the independence and historic separateness of the South during the time period in mind, one may safely hypothesize that Democratic presidents will align with the Northern Democrats in Congress. Likewise Republicans will align with their full party membership (despite some liberal outliers from the Northeast). On contested votes with presidential position, both

voting blocs display impressive support with presidents of their own party. Southern Democrats never display that. Therefore the larger the president's core supportive bloc, the greater the likelihood of winning the president's position. As shown later, I use a variable labeled as 'bloc size' to represent the percent of seats held by members of the president's core supportive voting bloc.

The factor of party is also simply captured by representing the president as either a minority or majority seat-holder in a given house of Congress. If a Republican has 190 House Republican votes aligned against 190 Northern Democrats, the balance of 55 being Southern Democrats, the Republican executive's floor position is probably far worse than the Democrats' is. Floor control still counts a great deal in floor voting outcomes, especially in the House. The epic 1961 floor fight over control of the House Rules Committee illustrates that control of rules gives the majority a great advantage in the eyes of all major participants.

Along with a 'bloc size' variable, the model incorporates a 'minority president' variable representing a president holding a minority of seats. This has, in the time covered, always been a Republican predicament. Since bloc size varies among numerous values whereas minority or majority status switch on or off, both are included separately.

Economic Indicators

A voluminous literature provides warrant to test national economic indicators as a determinant of presidential success. Inflation, unemployment, or their conjunction in the misery index, show linkages to presidential and congressional elections outcomes, to presidential approval, to presidential 'going public' activity, and to presidential floor success. Little is required to justify use of a national economic well-being indicator. With use of the inflation-plus-unemployment 'misery index' by Ostrom and Simon (1985, 347-49) and more recently Brace and Hinckley (1991; 1992, ch. 4), or unemployment and inflation separately in Brody (1991), the economy has obvious cachet.

This paper employs the quarterly unemployment indicator as a time-sensitive and publicized indicator of the economy's direction. Alternative specifications for ~~either~~ both inflation and a misery index are still underway, and are not reported here.

'Two Presidencies'

Finally, there is reason to expect distinct treatment of presidents on the basis of issue content. The traditional 'two presidencies' thesis predicts that presidents will prevail on the floor more often in foreign policy contests. Edwards (1989, ch. 4) in reviewing presidential support scores, concludes that this phenomenon is fading and time-bound, but it was robust during much of the period from 1953. Additionally, recent evidence indicates that presidents indeed do win more often on the floor with foreign issues--at least, when a president is a Republican or minority seat holder in Congress (Bond and Fleisher 1990, ch. 6; Renka and Jones 1991).

To model this, a 'foreign issue' variable is included to signify that a two-presidencies effect is expected.

The Data

All House and Senate roll calls with presidential position and a nonconsensual vote outcome were modeled from 1953 through 1986 (N = 2027 House votes, N = 2613 Senate votes). Maximum likelihood estimation is done with logit analysis, using summary measures of likelihood ratio, and percentage of correct predictions.[6] The variables are:

Presidential Success (dependent variable) - If the president's position prevails on a nonconsensual vote, it is coded 1; if it loses, it is coded 0.

Honeymoon - The first six months of a president's first full term are coded 1; all others are 0.

Approval - The Gallup Poll asks the question: "Do you approve or disapprove of the way President ___ is handling his job as president? The current month's nationwide poll result is used in conjunction with all roll call votes from that month; if two occurred, the average is taken; if none, the rating is interpolated from the two polls bracketing that period. Data is obtained from King and Ragsdale (1986, 295-307) and Edwards with Gallup (1990).

Vote - The president's share of the national popular vote from the previous election is used. Interim presidents inherit the vote of the predecessor.

Agenda Size - The annual number of nonconsensual roll calls on which Congressional Quarterly records a presidential position are used to tally the number of contests a president confronts in that year's session.

Bloc Size - The proportion of seats held by the president's core supportive voting bloc is shown. For Democrats, this consists of all Northern Democrats; for Republican presidents, it is all Republicans.

Minority president - If the president confronts a house of Congress controlled by the opposing party, this is coded 1; otherwise it is 0. For this data, only Republicans fall into this category.

Foreign issues - If the vote is on a foreign issue, this is coded 1; otherwise it is 0.

---

[6] Pseudo-R squares are also shown although their interpretation remains problematic. Recent work (Hagle and Mitchell 1992, 772-774) indicates that some pseudo-R squares are useful for measuring explained variance with logit.

Unemployment - The nation's quarterly unemployment report is used for all votes during the subsequent quarter.

Extramajority votes - This is a control to incorporate roll calls where more than a simple majority is required for the president to win.

Submajority votes - This control incorporates roll calls where less than a simple majority is required for the president to win.

Results

Table 1 displays the results for the U.S. Senate from 1953 through 1986. Table 2 displays the same configuration of results for the House over this period.

Results of testing a direct measure of time locale, in the honeymoon period, unequivocally shows that no unique effect from a honeymoon exists independently from other factors. This is striking because of the voluminous testimony on its benefits. If any particular calendar locale would benefit a president, seemingly it would be this one. To judge whether any time locale per se was related to success, other formulations of time were tried, including age of the administration in months. But none of those produced an appreciable effect in either House or Senate.

One reason the honeymoon apparently has no unique effect upon likelihood of presidential success is its relationship with approval, shown in Ostrom and Simon (1985), and Brace and Hinckley (1992, 81-83). Approval therefore was expected to show an impact. It did, but the direction of the effect in the House is strikingly different than the expected strong and positive relationship of approval to success displayed in the Senate.

The House result hearkens to Bond and Fleisher's (1990, 25-30) dismissal of national approval ratings as meaningful to members of Congress. They argue that only district-based approval would (if used in a model) prove meaningful as an influence. This does not fit at all with interpretation of approval given earlier in this paper, or a result based on both consensual and nonconsensual floor votes given in Brace and Hinckley (1992, 81-83, 190-192). But it is possible that a certain district focus exists in the House which differs from the Senate, with only the Senators staying fully conversant with the president's national approval ratings. However, this evidence produces no warrant for Bond and Fleisher's general dismissal of national approval as an important factor in presidential success and failure.

The finding on agenda size also distinguishes House from Senate to a surprising degree. The House strongly confirms the suspicion that a president pays a real price for a crowded congressional docket. Whether the reason is his own ambitious agenda, that of others, or a reform-era effect of raised issue loading on the floor, the effect is reduced likelihood of success. But there proves to be an opposite effect in the Senate!

Table 1

Logit Model of Likelihood of Presidential Success on Senate Votes, 1953-1986

VARIABLE NAME	ESTIMATED COEFFICIENT	STANDARD ERROR	T-RATIO 10 DF

PERCENTAGE OF RIGHT PREDICTIONS = 69.2 PERCENT

One result that is fairly uniform shows that the size of the president's vote is negatively related to success in both chambers. This appears counterintuitive, but one must recall the strong linkage of very high vote outcomes for Johnson in 1964 and Nixon in 1972, both being followed by a most exceptional spate of presidential troubles. In addition, this result may be strongly related to the previous one on agenda size. A major vote winner such as Johnson in 1964 has grounds for ambition. So far as pure likelihood of success on a given vote is concerned, an expansive agenda is very poor medicine, but the germane presidential time frame is not yearly but by the term. The results therefore do not warrant prescribing that a president forsake ambition for a higher batting average on a year's floor votes. Johnson's 1965 judgment to "use it or lose it" was probably a correct one no matter how hard he pushed for a large Great Society policy legacy.

The effect of bloc size and a president's minority status bears careful interpretation. The bloc size variable only states that as the size of the president's core supportive voting bloc gets larger, chances to win improve. Obviously this is related to a president's minority status, which as expected is a severe depressant. It is the combination of being in the minority or not, and number of seats held, which is important. Once again, House and Senate differ on the coefficients for bloc size, but both show a robust effect of president's minority status. In combination, these may not be as contrasting a result as this division of variables makes it appear.

Even unemployment produces a differing effect in House and Senate. This was not expected because presidents facing House and Senate usually found similar partisan and voting bloc divisions, excepting the six Reagan years of Republican Senate control. The factor of party may be quite important, as rising unemployment has a different impact upon Democrats than Republicans (Forshee and Renka 1991). Unemployment is also related to presidential approval (Brody 1991, 91-103). However, these findings provide no ground for seeing a strong House-Senate difference in the effect of unemployment. Instead, it is likely that disentangling unemployment from other indicators should result is a similar measured effect on success in both chambers.

There is too much distinction of House and Senate results for satisfaction. Not that House and Senate must obey precisely the same formulation of principles, they should still not display so stark a set of discrepancies as shown here. Few floor studies have shown major chamber differences in how Senators and Representatives vote. Additional data and a set of additional tests are now being undertaken to ascertain what may underlie these distinctions.

Conclusion

Considerable work is necessary for modeling what produces success and failure for presidents on the floor. This paper establishes two basic things. One is that political

ideology is not, as presently measured, a necessary variable for inclusion; its effect can be satisfactorily proxied with adoption of the congressional division into three de facto voting blocs. This does not deny that personally held political beliefs are important, rather that they are not appropriately measured with an ACA/ACA or other floor-vote based measure when the result is then applied to other floor voting, such as presidential nonconsensual votes. The repeated finding of congressional voting consistency serves as a formidable barrier to vote-based formulation of independent variables.

Another finding is that models of presidential fortunes on the floor should be time-sensitive within the unit of a year. Much happens in a month-to-month or shorter context that is readily missed by reliance upon yearly averages for factors such as presidential approval. As for results from this model, presidential success and failure prove not to be simply functions of the calendar in the fashion suggested by commonplace prescriptions about using the honeymoon as a time of unique opportunity. Honeymoon, and time locale more generally, is a function of the president's capital holdings. Those holdings often are more flush during the first six months of a new administration after the election--but not necessarily, and not always. President George Bush enjoyed no honeymoon, nor did President Kennedy, nor in likelihood does President Clinton. (If the six months just past were a honeymoon for Clinton, what is yet to come?) Likewise, Presidents Johnson and Reagan enjoyed ambitious and effective post-election "first" half-years because the capital coffer was full (see Light 1991).

Much work remains for shaping the particular models presented here, to satisfactorily represent the specific relationship among factors including the presidential election outcome, presidential approval, size of the floor agenda, and control of the floor by the president's or the opposition party.

Lynn Yeakel versus Arlen Specter: The Year of the Woman in Pennsylvania

Tari Renner
Associate Professor
Department of Political Science
Duquesne University
Pittsburgh, PA 15282

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, Washington, D.C.

Many journalists and political activists proclaimed that 1992 was the "Year of the Woman" long before election day. A record number of women were running for state legislature, the U.S. House, Senate and other statewide offices. This phenomenon presumably precipitated by an increased concern over domestic affairs in the aftermath of the Persian Gulf, twelve years of benign neglect by a Republican Administration in Washington and the increased saliency of so-called "women's" issues such as abortion and sexual harassment.

While the general election resulted in far from proportional representation, it clearly produced unprecedented gains for women. They nearly doubled their percentage in the U.S. House up to about 11 percent and tripled their presence in the Senate (from two to six). The latter gains included the election of the first African-American female, Carole Moseley Braun, to the nation's upper house. Carpini and Fuchs (1993) report that after the election, approximately one-fifth of statewide elected officials and one-fifth of state legislators were women.

In addition to the increased attention to the nation's domestic problems, Carpini and Fuchs (1993) suggest several factors which greatly improved the political environment for women candidates in 1992. First of all, voters tend to punish the President's party for poor economic times and most female candidates ran as Democrats. Second, since the vast majority of congressional incumbents were male, the substantial increase in voluntary retirements and redistricting after the 1990 census resulted in improved prospects for many women candidates to run in open seats. Third, the disillusionment of voters with Washington insiders and so-called "gridlock," gave female candidates the opportunity to use their inexperience and outsider status in campaigns as an asset. Finally, the Anita Hill-Clarence Thomas

hearings in October of 1991 increased the saliency of sexual harassment and other gender inequality issues, and provided incredible stimulus to women political organizations and potential candidates.

The Hill-Thomas controversy substantial indirect consequences which probably had more to do with producing the gains for female candidates in 1992 than any other factor. At the time of the hearings a large plurality of Americans said they believed Thomas over Hill (47% to 24% in *U.S.A. Today's* poll). However, very few Americans were strong long term Clarence Thomas supporters. The reverse was true for those who believed Anita Hill. For many people, it was a defining moment in their political socialization (a never ending process). They would be motivated to vote, organize, contribute and run for office with greater frequency than they would have in the absence of this event. The televised confrontation demonstrated, for these voters, the "blame the victim" syndrome even though the woman was a fairly conservative, professional who did not voluntarily come forward, had little (if anything) to gain and passed a lie detector test. The drama was complete with a presumably arrogant and grandstanding male "defendant."

The softness of the initial public "support" for Thomas is demonstrated by opinion polls conducted in October of 1992 on the one-year anniversary of the hearings. Despite the fact that Thomas had "won" by his 52 to 48 confirmation vote and had a year of service as a Supreme Court Justice to legitimize himself, the surveys showed a clear trend toward Anita Hill. Most polls indicated that a plurality of Americans (and solid majorities of women), believed Hill over Thomas, one year after the fact.

The extent to which the Hill-Thomas hearings stimulated women to become candidates has not been measured precisely by empirical research. The anecdotal evidence, however, indicates that it was a very important motivating factor. At least two serious female challengers to incumbent Senators who supported Clarence Thomas (Carole Moseley Braun and Lynn Yeakel), indicated publicly that the hearings were the factor which prompted them to run. This impact should not be understated given that recent research (MacManus, 1992) suggests that the most important obstacle to increasing female representation in public offices is candidate recruitment. Other research by Costantini (1990) indicates that although it has decreased in recent years, there is still a gender gap between the political ambitions of male and female activists. The Hill-Thomas hearings might be viewed as a "spark" which, as Carpini and Fuchs (1993) have put it, "set the resurgent women's movement ablaze."

This is particularly apparent in the re-election campaign of one of the most visible interrogators of Professor Hill, Arlen Specter of Pennsylvania. To a greater degree than virtually any other in 1992. The October 1992 hearings directly affected the contours and outcome of this election. As noted above, Lynn Yeakel was one of the two most prominent female challengers who indicated that the hearings were the primary motivating factor in influencing them to run. Unlike Carole Moseley Braun of Illinois, however, Lynn Yeakel also used the event as the stimulus during the campaign to rise into the limelight from total (not virtual) obscurity. This paper seeks to examine the 1992 U.S. Senate contest in Pennsylvania in order to more thoroughly understand the reasons for the outcome its consequences and implications for other female candidates who stress "gender based" issues.

The Primaries

Lynn Yeakel began the race in early 1992 literally with zero statewide name recognition. Although her father had been a Congressman from Virginia, she lived in the Philadelphia suburbs and had little involvement in Pennsylvania politics. She entered the Democratic primary race against two Western Pennsylvania male politicians that had each run two statewide campaigns in the past. Lieutenant Governor Mark Singel of Johnstown was considered the clear favorite to oppose Specter. He was young, well known, articulate and had few obvious liabilities except for his association with Governor Robert Casey, who had become extremely unpopular. He had solid support within the party establishment in one of the nation's strongest party organization states. In fact, the Democratic party state convention overwhelmingly endorsed Singel approximately two months before the primary. The other major candidate was Allegheny County State Attorney Robert Colville of Pittsburgh. He had run two unsuccessful statewide races before, but received respectable vote totals in each and appeared to have strong support in his Southwestern Pennsylvania base.

Yeakel received favorable reviews early in the campaign from both journalists and Democratic political activists with reformist leanings. She began to gain the attention of elites, raise money and recruit volunteers long before she registered in public opinion polls. In interviews with the author early in the campaign, reporters John Baer of *The Philadelphia Daily News*, Dennis Roddy of the *Pittsburgh Press* and Dick Robbins of the *Tribune Review* all found Yeakel to be very "impressive." They believed that she was

articulate, intelligent and straightforward. Each, however, wondered how she could possibly defeat Singel and Colville with so little name recognition, party support and time.

Yeakel ultimately won the primary by largely ignoring her two Democratic rivals and focusing her attacks upon the Republic incumbent, Arlen Specter. In fact, it was her now classic "head on" television attack ad of Specter's questioning of Anita Hill that propelled Yeakel into contention. The ad replayed a critical segment of Specter's performance during the hearings followed by Yeakel discussing her anger over the incident. Almost immediately after the ads began to run, the *Pittsburgh Post-Gazette* polls showed her growing from one percentage point in late March to 17 percent in mid-April. This put her in a strong second to Singel who had slipped to 25 percent. The gap was only 26 to 21 percent among likely voters. Yeakel's support continued to grow in the remaining few days before the April 28 primary. The incredible success of her late blooming campaign clearly took the Singel people by surprise. They weren't sure how to respond since they weren't even attacked.

On primary election day, Lynn Yeakel won a comfortable plurality of votes. She received 44 percent of the total compared to 33 percent for Singel and 14 percent for Robert Colville. Yeakel won all but a handful of Pennsylvania's 67 counties including a 41 to 27 percent margin over Colville in Allegheny County. She received an enormous boost from the national and statewide media attention following her "come from nowhere" victory. It would not be unreasonable to conclude that, almost overnight, Yeakel became a political celebrity. Statewide polls began to show her even or slightly ahead of Specter in general election trial heats.

Unfortunately for Lynn Yeakel, Arlen Specter also went through a primary campaign which strengthened his position for the fall. Specter was opposed for the Republican nomination by State Representative Steven Friend from the party's Right wing. Republican conservatives had historically been suspicious of Specter for his moderate voting record, pro-choice abortion stance and, most recently, his opposition to Robert Bork. In fact, the conventional wisdom is that Specter strongly and visibly supported Clarence Thomas primarily to appease the Right's resentment over Bork. At the very least it was clear to Specter that the conservative challenge within his party could have been very serious. In the 1990 gubernatorial primary, for example, the state party's endorsed candidate, Auditor General Barbara Hafer, was pro-choice. An unknown anti-abortion housewife from Johnstown nearly beat her with 46 percent of the vote. Specter's overtures to the Right, however, were not sufficient to prevent an intra-party challenge. This may have actually been a blessing in disguise to Specter since the aggressive and often nasty attacks upon him during the primary campaign helped reinforce his image as a moderate among voters.

The most vicious of these came in the production of an anti-Specter comic book by the Friend campaign. Although it was distributed to a very small fraction of the electorate, the media coverage of it was substantial. This technique was a novelty in modern elections and the Friend campaign first released it to the state's largest circulating newspaper, *The Philadelphia Inquirer*, with timing that guaranteed they would have to run it in their Sunday edition or lose the exclusive. Given the extreme nature of

its content, coverage of the anti-Specter comic book spread like a prairie fire. Even *U.S.A. Today* printed a section of it on Tuesday following the release.

The 16 page comic book was primarily a series of graphically illustrated Right wing attacks on Specter. It included, for example, a picture of Specter physically beating up on Robert Bork lying on the ground. Specter is assisted by Ted Kennedy (holding a martini while wearing no pants and hearts on his underwear), a man labeled A.C.L.U. and a fat woman with curlers labeled N.O.W. After reminding voters that Specter has supported "homosexual rights" (in bold face capital letters) and taxpayer supported "obscene and anti-Christian art" through N.E.A. grants (same graphic portrayal), an illustrated picture follows with a male flasher exposing himself to a woman. The flasher's coat is labeled "N.E.A. Project." In addition, voters are reminded of the abortion differences between the two candidates with a picture of the "Radical Abortion Groups." The illustration portrays two women (one labeled N.O.W. and the other N.A.R.A.) as executioners (one hooded) sharpening their weapons. The effects are accentuated by the sparks flying from the wheel and blade and a noose in the background.

In leaving no stone unturned, the comic book also included several attacks upon Specter that wouldn't be considered Right wing. These include a reference to Specter's single bullet theory and several pictures of Specter in his U.S. Senate tree house ("Arlen's Clubhouse") with a sign that says "no gurls allowed." On the last page, Friend is sweeping out the Senate tree house with signs that say "Girls Allowed," "Public Club" and "Under New Management."

Although Friend received substantial publicity and increased name recognition from this comic book, he gained little additional support from the coverage. He ultimately lost to Specter by a 65 to 35 percent margin. The severity and nature of the attacks, however, did appear to reinforce Specter's image as an ideological centrist. The Republican primary against Friend also gave many party conservatives an opportunity for political catharsis. They could punish Specter by voting against him in the Spring and thereby, feel more comfortable supporting him in the Fall against an opponent to his left.

The General Election

In the general election against Arlen Specter, Lynn Yeakel found that the expansion of her base beyond her primary coalition was a very difficult task. To achieve victory in the Fall, Yeakel needed to receive overwhelming majorities among the key components of the state's Democratic New Deal coalition. This included Catholic, working class, African-American and Jewish voters. Many of these people were less than enthusiastic about her "socially liberal" image. They needed to be motivated to vote for Yeakel on the more traditional "bread and butter" economic issues. It has been these concerns which have binded the diverse Democratic coalition together in Pennsylvania. Yeakel's inability to shift the agenda more toward economic issues and put a clear wedge between her and Specter on them probably cost her the election. The prototype example of this strategy was the special U.S. Senatorial election in 1991 between Richard Thornburgh and Harris Wofford. The Wofford campaign erased a 59 percent deficit (71 to 12) by stressing his support of national health insurance.

Yeakel had some "slack" in putting together a majority against Specter. The Democrats can suffer more defections than the Republicans given their 400,000 vote registration edge in Pennsylvania. In addition, Yeakel appeared certain to win a small core of Republican female votes that would not normally be in the Democratic column.

Yeakel's task in forging a winning coalition, however, was difficult as a result of her campaign inexperience. She made several critical missteps, was often slow to respond to Specter's attacks and generally failed to direct the agenda in the general election. Shortly after winning the primary for example, her campaign appeared to shift into low gear during much of the summer. Specter, meanwhile, was not only actively campaigning in person throughout the state but he began to run his television ads.

At least one of these was an "immunizing" spot on national health care. Specter directly talked to the cameras about the severity of the problem and the need for national action. Although very few specifics were provided, the Specter campaign did not want their man to be vulnerable on national health care. They saw the incredible power of the issue in the 1991 Senate election referred to earlier. At the very least, Specter managed to "muddy the waters" on a critical wedge issue for his opposition. Specter was advantaged to the extent that he and his Democratic opponent were not clearly perceived as differing on the controversy.

The Specter campaign also seized upon the opportunity to attack Yeakel. If she wasn't going to more clearly define herself early in the campaign, he would do it for her. Specter's ads were carefully designed so as not to appear that he were viciously attacking another woman. Typically, a negative piece of information was graphically provided to voters followed by a

question which asked whether or not this bothered them. The attacks included statements about her delinquent payment of $17,000 in wage taxes to Philadelphia, the mispronunciation of Juniata County and Yeakel's verbal stumbling over a reporter's question about what specific things Arlen Specter had "waffled" on. The latter was particularly damaging given that the question was asked at a morning waffle breakfast campaign event designed to symbolize her opponent's "waffling" on important public policy issues. The Specter campaign's goal was to create an image of Yeakel which showed voters the other side of inexperience.

Specter also attempted to diffuse his gender-gap problems from the Anita Hill controversy both directly and indirectly. His attempts at the latter included a well publicized endorsement by the First Lady, Barbara Bush, and a joint tour of a breast cancer treatment center in Pittsburgh. His campaign hit the problem directly in a television ad which featured Teresa Heinz, the widow of ex-Senator John Heinz. Ms. Heinz stated that she did not approve of Specter's questioning of Anita Hill but still strongly supported the Senator's re-election since it was unfair to judge elected officials on a single action. She reminded voters what a wonderful team Specter and her late husband had made representing Pennsylvania together in the Senate. She did not, of course, point out that Specter and her husband had often been political opponents prior to Specter's election in 1980. When Heinz won a hard fought contest for the 1976 Republican Senatorial nomination, his most serious opponent was none other than Arlen Specter.

Specter appeared to be gaining the upper hand against Yeakel by early October. Most public opinion polls showed him leading by between 8 to 14 percentage points. Republicans seemed to be increasingly confident about

their prospects of retaining the seat. A September 27 article by *The Washington Post* was entitled "Incumbency Gambit by Senator Specter Breaks Yeakel's Momentum" (Russakoff, 1992).

The Yeakel campaign's counterstrike, however, had not yet begun. She regained the initiative in the last few weeks and nearly defeated Specter on election day (51 to 49 percent split of the two-party vote). Yeakel attacked the incumbent for several critical votes and being part of the status quo in Washington. She called for policy "change" in several well publicized events with other prominent Democrats including Bill Clinton and Harris Wofford. The nature of her general election campaign's final weeks however, in stark contrast to the primary, was more ad hoc than thematic. There were no clear bread and butter wedge issues (such as national health care, minimum wage extensions, plant closing legislation, etc.) which separated the two candidates in voters' minds. Yeakel needed to greatly expand upon her primary coalition in the general election by focusing upon these controversies. Given the industrial nature of the state's economy, the strength of its labor unions and the impact felt by several waves of Post World War II economic dislocation, economic issues have been especially prominent in Pennsylvania's electoral politics.

Yeakel's difficulties in clearly delineating her economic positions from those of Specter are illustrated by the lack of unity in labor union endorsements and her extremely weak vote totals (relative to the normal vote) in Western Pennsylvania. With respect to the latter point, the geographic distribution of Yeakel's vote was inconsistent with that of recent Democratic candidates. Michael Dukakis, for example, lost to George Bush in 1988 by the same 51 to 49 percent statewide two-party vote split as Yeakel's loss to

Specter. Dukakis, however, had overwhelming margins in most Southwestern Pennsylvania counties. Dukakis' percentage in Allegheny County (Pittsburgh and most of its suburbs) was actually the highest received by any presidential candidate since Lyndon Johnson in 1964 (the second highest record during this period was Walter Mondale's vote in 1984). The region was clearly unmotivated by Bush's socially conservative "Flags and Furloughs" pitch in the face of vetoed plant closing legislation, continued minimum wage freezes and reductions in many domestic economic programs. Despite his solid support in the Southwest, Dukakis was unable to win Pennsylvania because of his substantial deficits in most of the rest of the state. His margin in the city of Philadelphia exceeded Bush's combined margins in the suburban counties but, Dukakis lost all but one of the traditionally Democratic industrial counties in the Northeast. This scenario, combined with the normally poor Democratic support in central Pennsylvania produced a large deficit that the Southwestern region could not offset (Renner, 1990). Lynn Yeakel, however, had about the same deficit in Southwestern Pennsylvania as she had in the rest of the state. Normally, a Democratic candidate who came as close as she did to her Republican opponent outside of the Southwest would have won statewide with heavy vote totals in this Democratic stronghold.

This point is even more clearly illustrated by comparing Yeakel's vote to that received by the top of the ticket in 1992. Clinton won by a comfortable margin over Bush statewide (45 to 36%) that was very similar to Wofford's defeat of Thornburgh in the previous year. The only region of the state, however, where Clinton's performance far surpasses Yeakel's is in the Southwest. If she could have replicated Clinton's margin in Allegheny County alone, Yeakel would have defeated Specter statewide.

Table 1 presents some summary statistics from a statewide public opinion survey conducted by the author during the campaign for the Greensburg *Tribune Review*. The survey of 720 voters was administered two weeks before the election (October 19-22). The systematic sample of registered voters was stratified by party registration and county. The Specter/Yeakel split was virtually identical to the final outcome. In the poll, Specter led 42 to 40 percent with 18 percent undecided. The Clinton/Bush/Perot split slightly understated the relative support of the latter two. Clinton had 41%, Bush 26% and Perot 15%. The statewide totals on election day were 45 to 36 to 18 percent. Although Clinton was leading by a 15 point margin and Yeakel had a two point deficit, the overall percentage support for the two was virtually the same (41% for Clinton and 40% for Yeakel). It is the actual proportion for each that are presented rather than the margins. This was done to make comparisons between a three-way and two-way contest more straight forward.

Given the general similarity, the exceptions clearly stand out. Yeakel is weaker than Clinton in Western Pennsylvania as noted above. She has more support in the suburbs (her home base) but less in the city of Philadelphia (Specter's home base).

The ideological patterns among liberals, moderates and conservatives are almost identical but Yeakel is much weaker than Clinton among Democrats and stronger among Republicans and independents. Clinton has greater support among Catholic and Jewish voters but less among Protestants. Surprisingly, the gender gap appears to be virtually identical for both Clinton and Yeakel. It should be noted, however, that this survey seems to have detected a slightly smaller difference in male and female preferences in the Senate race than most other statewide surveys.

Yeakel's weaknesses among some of the critical demographic groups in the party's New Deal coalition provides at least modest support for her need to stress economic issues. While Clinton and Yeakel had similar support levels among whites, there was a 21 percent gap among black respondents. Yeakel also lagged among voters over 50 and especially among those with less than $20,000 a year family household incomes. Clinton's 48 percent was two and one half times that of Bush (19 percent). Yeakel's 36 percent was actually five points behind Specter's support. That latter margin exceeded her two point deficit among all voters. Yeakel received her weakest support from the poorest Pennsylvanians while Clinton received his strongest support from them.

Conclusion

The 1992 elections may have been an electoral "Year of the Woman" from the perspective of media attention, number of female candidates and unprecedented, but limited, gains in the proportion of female office holders. From another perspective, however, it has the possibility of being much more. The additional election contests involving women as candidates, regardless of their success or failure, provide activists and scholars with a greater number of cases from which to generalize. It is in this context that this paper has sought to examine one of the most widely publicized, yet unsuccessful, challenges of a female outsider to a male incumbent.

Lynn Yeakel began her candidacy as a total unknown. She effectively used the intensity of opinion over a highly emotional "gender based" controversy to catapult herself into becoming the Democratic nominee. Although it was a remarkable feat, she won the primary with a minority (44

percent) of the votes. She needed to expand upon this core constituency. The process of expansion proved to be more difficult than the creation of her base.

Inexperience was probably a double edged sword for Lynn Yeakel in the general election against the "veteran," Arlen Specter. She was often on the defensive and, more importantly, was unable to define herself in a way that would distinguish her from Specter on the type of bread and butter issues that have historically been crucial in the state. This is reflected in the geographic distribution of her support and her relative weakness among many of the Democratic party's key coalition groups. This weakness was especially dramatic among the poorest segment of the electorate. Given the structural bias in how the media reports on female candidates who run on "gender based" issues and the probable tactics of the opposition, such candidates must understand the special need to create a well defined image which presents their vision or agenda on other crucial policy issues. These will necessarily vary depending upon the political culture of each area and the contemporary political environment.

Despite her loss, Yeakel's candidacy made several contributions to her cause. First of all, she became a symbol and role model for other possible female candidate outsiders to emulate. Yeakel demonstrated the power of her issues by coming from nowhere to the Democratic primary, obtaining substantial media coverage and nearly beating an incumbent in the fall. In addition, her campaign "incorporated" many voters and activists into the electoral process that would not otherwise have participated. In this sense, Lynn Yeakel is similar to Ross Perot. The campaign workers and voters who were so motivated may continue their participation in the future. It is

difficult to determine the exact size of this group within the electorate in the absence of any systematic data. However, even if they are only one or two percent of all Pennsylvania voters, the consequences for the state's electoral politics may be substantial. This is particularly likely given that Yeakel's candidacy puts another nail in the coffin of the state's Democratic party organization and encourages other would be candidates to continue the hammering. She demonstrated that an inexperienced unknown can comfortably win the Democratic nomination for one of the two highest offices in the state without <u>any</u> support (indeed active opposition) from the state's party establishment. While this may have become commonplace in other states, it is comparatively rare in Pennsylvania. Yeakel's campaign may prove to be both an indication of, and catalyst for, a trend in the keystone state toward more candidacies based upon (or more sympathetic toward) gender equity issues. This will be a necessary, but not sufficient condition, for public policy change in one of the last bastions of brokerage politics.

TABLE 1
CLINTON AND YEAKEL SURVEY SUPPORT PERCENTAGES,

POLITICAL MOBILIZATION FOR THE ENVIRONMENT

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993. Copyright by the American Political Science Association.

ABSTRACT

Research on political participation and mobilization has traditionally focused on the way in which people participate without paying attention to the substantive issues which are of importance to the individual. This study considers participation, specifically contacting public officials, in a model of specialization and attentiveness to science policy issues. The scientific basis of environmental issues makes it a representative area of science policy. Through structural equation modeling using data from two (1990, 1992) national random surveys of American adults, gender, marital status, presence of children in the home, informal science education, attitudes toward science, and environmental knowledge are found to positively influence political participation for the environment. The overall explanation of the dependent variable is low, however, lending credence to the suggestion that protecting the environment has diffuse, consensual support, and is not as easily predicted as other science policy issues.

Participation

V.O. Key (1961:324) contends that "in the American system the individual is subjected to an indoctrination from the time he begins to be aware of politics that it is his duty to vote and to fulfill his political role in other ways." For whatever collective or individual motivations, we do know that many people participate in a variety of ways. Nie, Verba, and Kim (1971:9) offer this definition of participation:

> political participation is the means by which the interests, desires, demands of the ordinary citizen are communicated. By political participation we refer to all those activities by private citizens that are more or less directly aimed at influencing the selection of governmental personnel and/or the decisions that they make.

There is no dearth of literature focusing on the range of activities in which a citizen might engage. Apart from voting, analysts have also considered the familiar list of behaviors ranging from trying to get someone to vote to terrorist activities (see for example: Almond and Verba 1963; Brody 1978; Campbell et al. 1960; Converse 1972; Conway 1989, 1991; Hirlinger 1992; Katz and Lazarsfeld 1955; Kenny 1992; Key 1961; Lane 1959; Lawrence 1991; Lazarsfeld, Berelson, and Gaudet 1968; Milbrath 1965; Rosenau 1974; Verba and Nie 1972; Verba et al. 1993; Wolfinger and Rosenstone 1980).

In his study of political involvement, Milbrath (1965:18), has proposed a hierarchical model of political participation in which voting is preceded by the behavior of "exposing oneself to political stimuli," and reaches the pinnacle with holding political office. Verba and Nie (1972) view the range of participatory behaviors somewhat differently, suggesting that people choose one or more specific modes through which they attempt to influence government. The four modes include voting, communal activity, campaign activity, and particularized contacting. Their premise is that people have differing goals as to what they want to accomplish through political participation. The consequences of participation differ based on the motives of the citizen and the combination of participatory acts selected.

It is essential to realize that participation is typically discussed in general terms. Whether providing support for democratic ideals or trying to meet individual needs and goals, participation can be studied apart

from any substantive issue area. Theorists and analysts can be satisfied to consider whether or not someone has voted or made contact with an official without examining the content of the decision to vote or content of a contact. The fact that the behavior was engaged in is all that matters. This is adequate for one approach to the study of participation. There is, however, need for a more specific analysis of participation when the content of the issue which motivates participation is taken in to account.

Specialization

Two distinct factors are working to impact the ability of citizens to be informed about issues on the political and social agenda: the ever increasing demands on time, and the amount of information needed to be well informed about current issues. With less time available to devote to public affairs issues while at the same time needing more information, the average citizen needs to specialize, that is to select a cluster of issues in which he or she is interested.

Over the past century, the typical American family has shifted from life on the farm and the small towns, to life in suburban areas outside of major cities. In 1880, 43.8 percent of the United States population lived on farms, while by 1986, this figure had decreased to 2.2 percent. The 1990 census showed an 11.6 percent increase in population in the 284 metropolitan areas, to nearly 78 percent of all U.S. residents. During this same decade, the growth in non-metropolitan areas increased by only 3.9 percent.

As the type of community changes, so does lifestyle. Life on the farm or small town included time for chatting, and discussion of current issues with neighbors and family. Life in modern suburbs consists of increased work hours, more time spent getting to and from work, more time engaged in activities such as sports, entertainment, clubs and organizations, and increased time watching television and movies on VCRs. With this change in how their time is spent, suburban dwellers spend less time reading or in conversation with family and friends, including less discussion about politics and current events. This decline in interest in politics is also seen in decreased voter turnout and a smaller number of citizens who know the name of their member of Congress (Miller 1992; Conway 1991; Hill & Luttbeg 1991).

At the same time that the demands on time increase, so do the demands for knowledge about the public affairs issues. Especially, the need for increased technical or specialized knowledge.

One can form an opinion on the issue of abortion, for instance, on emotional or moral grounds, but the scientific and technological underpinnings are also significant. In the 20 years since the *Roe v. Wade* ruling, the trimester conditions for fetal viability became less meaningful as medical technologies were able to assist premature babies born in the second trimester. Similarly, abortion issues have been raised as reproductive technologies have advanced in the areas of *in vitro* fertilization and cryopreservation of embryos. During *in vitro* fertilization multiple eggs are typically fertilized and successfully implant in the uterine wall. Selective termination is necessary to prevent an improbable number of pregnancies to carry on. Or, embryos which were not reintroduced in the uterus are stored for potential future use. In other words, even a "social" or "moral" issue such as abortion has a scientific basis. Indeed, someone can develop an opinion about the issue without knowing science, but others, including policy makers, have access to more technical information, and may utilize this information in their assessment of the issue.

Not everyone can be a specialist on every issue (see Table 1). For some people, their interest in the abortion issue will lead them to focus on that issue to the exclusion of another. Tradeoffs of time and information acquisition take place. A farmer interested in agricultural issues will spend time listening to farm bureau reports and may not have any idea of what the latest space shuttle mission hopes to achieve.

Someone who has relatives in Yugoslavia is likely to follow developments between Serbian and Croatian forces and the United States' policy position, but may have little interest in social security policy decisions. To become a "specialist" in a specific area to the exclusion of another is rarely a calculated decision. Instead, it is a function of a variety of life experiences such as occupation, level of education, ethnic background, or employment status. Even if these individuals did have the desire to be informed about more than two or three issues, the demands of the current lifestyle discussed above hampers their ability to do so.

In sum, through the specialization process people concentrate on gathering information on a topic of particular interest or importance to them, while not to paying attention to other issues.

Attentiveness

If an individual specializes in a certain area, he or she is certainly not alone in that interest. There is a group of people who have similar interest in any given issue. Almond (1950), in his discussion of foreign policy, describes a stratified model of issue attentiveness. Further elaboration and refinement of this stratified model has been carried out in extensive work by Miller and his colleagues (see Miller 1983b, 1992; Miller Prewitt and Pearson 1980; Miller, Suchner and Voelker 1980). Depicted in the form of a pyramid, this model places decision makers at the top, followed by policy leaders, the attentive public, the interested public, and the non-attentive public.

A pyramid such as this can be portrayed for any issue area, with different individuals comprising the different tiers. The decision makers are those who make binding policy decisions; typically legislative, executive, and judicial officers who have relevant responsibilities in a given area. The policy leaders are those who, although lacking decision-making authority, are active in formulating policy, and formally or intellectually represent constituent groups who have an interest in the issue (Miller 1992). The members of this group also differ depending on the issue at hand, are instrumental in deciding which issues should be dealt with, and are closely involved with the decision makers in making policy.

The point needs to be made that these top two levels are responsible for the vast majority of policy decisions. This is particularly true in areas such as science policy issues where highly technical and specialized knowledge is needed (Miller 1983a). This policy making process does not, of course, always run so smoothly. When a dispute arises that cannot be resolved readily by the decision makers and the policy leaders, the process is expanded to include other layers of the pyramid, most notably, the attentive public.

The attentive public comprises the third level and includes those individuals who are interested in the issue, as well as able to obtain resources in order to become and remain informed about the issue. These individuals are the ones who decision makers and policy leaders are able to tap in order to gain support for a specific issue (Rosenau 1974). Since many issues are resolved at the top levels, the attentive public is not involved with every issue. They are interested and acquire current information about the issues, but it is not necessary for them to become active or mobilized on most issues (see Table 1). In other words, the attentive public is attentive continually, and mobilized episodically.

Although the notion of attentive publics is somewhat limited in the literature (Almond 1950; Barke 1986; Devine 1970; Rosenau 1974), individual attentiveness is discussed. Converse (1972:334) suggests that "from the point of view of political influence and outcomes, it is likely that the potential activists are a more important group than the sometime voters". Rosenstone and Hansen (1993) speak of those individuals who are ready to be mobilized when needed as being interested and informed. In the development of a variable to measure civic competence, Strate et al. (1989:450) state that "making informed political judgements requires political knowledge and habits of attentiveness to politics to assure that knowledge is

current". Verba and Nie (1972:113) describe active participants as those who have defined their own set of salient issues.

Beneath the attentive public are those who are merely interested in an issue, but unable or unwilling to make the effort to become informed. Finally, the non-attentive public is that segment of the population which is neither interested nor informed about the issue. Neither of these groups are likely to become involved in an issue dispute, unless the issue suddenly becomes of remarkably great salience.

Mobilization

An overview of political participation, specialization, and attentiveness has now been provided. There is, however, a missing step in the process by which an individual participates in the political system. That is, the step of mobilization. The argument can be summarily stated that an individual specializes in a particular topic, becomes attentive to an issue area which includes other people with similar interests (an attentive public), and is then ripe for active participation in the political system. This next step into active involvement is not likely to come spontaneously, rather the individual is mobilized. That is, some external force acts to bring about the participatory behavior be it voting, letter writing, or making a contribution. The individual has approached the public policy issue from one end through interest and information acquisition, while from the other end--as the need arises--the political system reaches out to him or her. "Citizens participate in elections and government both because they go to politics and because politics comes to them" (Rosenstone and Hansen 1993).

Participation is not without its costs, so deciding to participate on one's own is unlikely. A certain level of education or experience is necessary to access the political system through structural barriers such as registration laws. Time is necessary if an individual is willing to attend meetings or rallies; not everyone has equal opportunity to spend an evening listening to a political leader. Verbal acuity is needed to contact a public official either by letter or telephone, and again knowing addresses, phone numbers, and even having access to stamps and a telephone further highlight the obstacles a potential participant faces.

Not every citizen, however, can be mobilized, especially not on all of the issues on the policy agenda. Rosenau (1974:30) claims that the "mobilizable public" is a subset of the attentive public, and that they fall within the group of interested and informed citizens as those who are "ready to put aside the obligations and worries of personal life in order to invest time and effort" in a particular issue. Perhaps a bit overstated, the point is that there are those who, with some stimulus, are willing to take their interest and knowledge about an issue a step further and participate in the public arena. Effective mobilization must be done strategically, as there is no reason to try to mobilize the entire population at all times. More sensibly, leaders will target those groups who are likely to participate (Rosenstone and Hansen 1993). Converse (1972:334) suggests that "from the point of view of political influence and outcomes, it is likely that the potential activists are a more important group than the sometime voters".

Between elections the attentive public and the mobilizable public remain interested and informed (Rosenau 1974). The decision makers and policy leaders rely on this fact, as policy disputes are possible, and there may be the need for non-electoral participation. To maximize the opportunity for mobilization, leaders will time their attempts to increase participation when issues are salient, when important decisions are about to be made, and when there is uncertainty surrounding a policy outcome (Rosenstone and Hansen 1993).

One such method of participation is the contacting of public officials. Although contacting may appear to be an activity available to every citizen, researchers have shown that there is a definite advantage

for those people who have more education, are of higher socioeconomic status, are not recent immigrants, and feel that the system is responsive to their needs (Conway 1991; Lane 1959; Milbrath 1965; Rosenstone and Hansen 1993; Verba and Nie 1972). Some form of mobilization is necessary for the individual to take this action, and organized groups are seen as being the most successful mobilizing agent (Lane 1959; Rosenstone and Hansen 1993).

Environmental Issues

As with other science policy issues, environmental issues are complex. Even a local dispute over a landfill can become a conundrum when the average citizen is confronted with the geology, chemistry, and biology of the situation. As environmentalists become more familiar with the interconnectedness of environmental hazards and the cross-media nature of pollution (affecting land, water, and air), the public can become even more confused. Scientists will frequently disagree on technical aspects of policies, leading to difficulty making an accurate judgment by policy makers and citizens alike.

The attentive public for the environment is larger than the attentive publics for other science policy issues. Environmental issues differ from others in that they directly impact more people, and therefore have an inherently broader appeal (Mitchell 1990). The environmental crises over the past decades have been widespread in both substance and geography. Love Canal, in the east, showed the problems of building communities on former chemical waste dumps. The Three Mile Island near meltdown, again on the east coast, sent a shock wave through populations near to or reliant on nuclear power. Air quality concerns in Los Angeles, and the resultant regulation of industry and automobiles, directly impact millions of people. Clearly, these issues are more proximate to more citizens than, for instance, the space shuttle program.

Data Source

The data to be used in this analysis are from the 1990 (SRS-90-02467) and 1992 (SRS-92-17876) surveys of the Science Indicators series of the National Science Foundation (NSF). These national surveys of public attitudes toward and knowledge about science and technology in the United States have been carried approximately every two years since 1979. The 1979, 1981, 1985, 1988, 1990, and 1992 studies were sponsored by the NSF Science Indicators Unit. The 1983 study was sponsored by the Annenberg School of Communication at the University of Pennsylvania, with funding from the NSF Public Understanding of Science Program. Jon D. Miller has been the Principal Investigator for each of the surveys.

Based on national random samples of American adults, 2033 respondents took part in 1990, and 2001 in 1992. The interviews were conducted by professional interviewers via a computer-assisted-telephone-interviewing (CATI) system using the Electronic Questionnaire (EQ™) software system. A response rate of 65 percent was achieved in 1990, while the 1992 survey had a 70 percent response rate. To correct for possible bias due to regional or socio-economic differences, the data are weighted by an algorithm which includes household size, age, gender, race, and education (see Miller 1992 for a complete description of the sampling and weighting procedures).

For this analysis, the data from 1990 and 1992 were pooled in order to have a larger group to carry out the analysis. Questions about the environment were asked of all respondents in 1990, and a random half of the 1992 sample were asked the environmental knowledge battery. The data analyzed, therefore, has a weighted N of 3030, with approximately two-thirds coming from 1990, and the remaining one-third from

1992. A variable will be included in the analysis to control for the effect of the year of the survey.

The Science Indicators series provides the opportunity to focus attention on specific issues within the more general science policy heading. Two batteries of questions were asked to establish attentiveness to several issue areas, including, issues about new scientific discoveries, the use of new inventions and technologies, the use of nuclear power to generate electricity, space exploration, and environmental pollution. With the ability to focus on specific issue areas, it is then possible to develop a comprehensive picture of attentives by including demographic characteristics, education, scientific literacy, attitudes toward science, and other explanatory variables.

Structural equation modeling will provide the most effective way to study the relative contribution of different factors on the dependent variable of attentiveness and mobilization. Using LISREL, the intervening as well as residual effects of each of the included variables can be measured, while controlling for each of the other variables (Joreskog and Sorbom 1988). The survey data contain little missing data, so the LISREL models can be run using an asymptotic covariance matrix.

Model of Environmental Mobilization

The dependent variable to be used is a modified version of the attentiveness variable used extensively in prior research (Miller 1983a, 1992). The previous measure ranged from zero to two with the low end being the residual category of those who were neither interested nor informed on the issues, the next being those who were somewhat informed but very interested. The highest category consisted of those who were very interested, very informed, and regularly read the newspaper, newsmagazines, or science magazines. This readership criteria reflects a persistence with regard to information acquisition. Members of this third category are considered the attentives to that issue area. In the present study, a fourth level has been added to this variable. Above the attentives are the mobilizables: those individuals who are attentive to the issue, but have also contacted a public official about a science-related issue.

Each instrument included a question which asked the respondent to indicate whether they had contacted a public official in the past year regarding a political issue. If they responded affirmatively, the respondent was then asked to indicate what the issue was that had precipitated the contact. If contact was made once, the respondent was then asked, "Can you recall another issue that you made contact about?" One more follow-up question was asked for a total of three possible issues. The verbatim replies to these probes were recorded by the interviewer, and later coded. Twenty-five percent of the respondents in 1990 and 1992 reported having made at least one contact with a public official.

As would be expected, the number of respondents who contacted on a science issue was relatively small; approximately five percent of the sample indicated that they had made at least one contact about such an issue. Of the total number of contacts made, 16 percent were science-related. Typically, science policy issues are not high salience, electoral issues, and for this time period there were no high-visibility issues with a scientific basis such as Three Mile Island or Chernobyl. It is not surprising, therefore, that the level of contacting was relatively low. There are, however, some people who did make contacts. These individuals can be considered to be mobilized, that is willing to make an extra effort to convey their opinions to policy leaders.

The relationship between the attentiveness-mobilization variable and the other variables to be included in the analysis are presented in Table 2. (A complete description of the variables can be found in Appendix A). Not unexpectedly, there are very small cell counts for those who are mobilized for the environment. The dependent variable is considered to be hierarchical, that is moving from low interest to

attentiveness and mobilization. In the structural equation model we are predicting to this distribution, so it is helpful to also consider the trends of the data in this table as the relationships increase and decrease. Substantively, the mobilized individuals are a subset of the attentive public. Interpretation of Table 2 can also be enhanced by adding together the percentages of the attentive and mobilized columns.

Gender differences with regard to science-related issues have long been acknowledged. In general, men are more likely to be interested and knowledgeable about science, while women are less inclined to pay attention or become informed, even when the level of education is held constant (Science Indicators 1981; Miller et al. 1980; Miller 1983a, 1990; Miller and Pifer 1993). With regard to specific issue areas, Milbrath (1984:75) contends that "studies using gender as a variable show that females typically are more environmentally-oriented than males." Other research has contradicted this claim showing that the attentive public for environmental issues is indeed more likely to be male (Miller 1990:35), and that men and women score the same on measures of environmental values (Mitchell 1984:160). In Table 2 we see more men represented in the higher categories of mobilization, yet women show strong interest.

Past research has shown differing impacts of age on attentiveness. Miller (1992) reports that most of the impact of age is accounted for by levels of education. In general, people with more education are more likely to be attentive to the issues, or scientifically literate. Some discrepancies have been pointed out, particularly with regard to environmental issues, in which the older population has unexpectedly high levels of attentiveness (Miller 1992). The data in Table 2 show a general rise in attentiveness and mobilization as age increases.

Literature on participation has often pointed to family circumstances as factors which impinge on or enhance the ability to be politically active (Abowitz 1990; Conway 1991). Being married has been found to positively increase participation, while having children at home is likely to hinder political activity. Research on informal science education has shown that having children is likely to increase participation, particularly museum attendance (Ressmeyer and Wallen 1991). The present data indicate support for the suggestion that being married increases participation, while having children is likely to decrease attentiveness and mobilization.

There is little disagreement that science education is helpful in making intelligent assessments about new technologies and developments. With the increasing complexity of the world in which we live, the requirement that individuals have some basic scientific knowledge becomes critical. We see this scientific and technological complexity not only in the truly phenomenal example of genetic engineering, but in daily life examples such as microwave ovens, personal computers, videocassette recorders and facsimile machines. As issues of the magnitude of nuclear power, space exploration, and biotechnology exist on the public policy agenda, we would hope to have informed decision makers and voters to grapple with the significant implications of such scientific policies.

Scientific literacy is a widely accepted measure of the level of knowledge of individuals. Miller (1983b; Miller 1991) describes the three components necessary to be classified as being scientifically literate. The first is to be able to understand the process of science, that is to be aware of the scientific method which utilizes observation, testing, and bases judgement on fact. The second component is that of understanding basic scientific terms and concepts. Finally, the individual, in order to be considered scientifically literate, must have a minimal understanding of the impact of science and technology on society.

The significance of knowledge becomes even more significant when "experts" on both sides of an issue are claiming the other is wrong. Scientific knowledge, when used as a political football, can leave the average citizens as well as well-meaning decision makers at a loss as to how to reach a fact-based decision

on the issue (Nelkin 1984). Furthermore, adequate knowledge may also serve the purpose of depoliticizing an issue "by helping to separate facts from values or by clarifying the technical constraints that limit policy choices" (Nelkin 1984:20).

Measures of scientific literacy used in the past have been general ones, that is touching on several science policy areas. In this study the focus is on considering attentiveness and mobilization in the specific area of environmental policy, so a specific environmental knowledge variable has been created.

In addition to questions measuring scientific literacy, respondents were asked to report how many math and science courses they took in high school and college. This scale is a useful measure to predict current activity and knowledge with regard to science policy.

Both measures of knowledge: science and math courses, and the environmental knowledge scale clearly indicate a greater likelihood of attentiveness and mobilization as the level of knowledge increases.

In addition to the more structured means of learning science through formal classes or workplace training, individuals may choose to become or remain informed through more informal means. These alternatives are characteristically voluntary, and out of a personal motivation the individual fits them in with other interests and obligations. Three of the often-examined sources of informal science education include television programming, science magazines, and science related museums (Dimmock 1985; Miller 1992). These are all available to the public, yet require motivation on the part of the individual to participate. Despite their public nature, obstacles limiting access to these means do exist. For instance, an individual in a rural area may wish to watch science television shows, but reception of public broadcast stations may be difficult. Access to science magazines requires subscription costs, as well as a certain level of literacy. Finally, the availability of science museums is conditional on the proximity to such resources. A resident in New York City would have the opportunity to visit a host of museums, whereas someone living in rural Montana has far fewer options. With such obstacles in place, those who do pursue informal science education are exhibiting a very intentional desire to gain scientific information.

Informal science education can be considered to have two potential impacts: that of initiating interest or knowledge, or that of sustaining interest and knowledge (Ressmeyer and Wallen 1991). Does a person go to a museum or happen upon a science television show and then become interested in science? Or, does a person who already has an established interest in science look for resources to supplement what he or she already knows. In studies of adult scientific literacy it has been suggested that such knowledge is generated through formal means, and then maintained through the mechanisms of informal science education (Miller 1992).

The measure of informal science education in this analysis, science-related museum visits, suggests that those people who visit museums are more likely to be mobilized for environmental issues (Table 2).

Whether or not an individual has a science-related occupation is hypothesized to influence the level of attentiveness of an employee. A professional who holds a college degree and works in a science-related firm is likely to be interested and informed in science policy issues. Even someone who does not hold a professional position, eg. a technician, is still involved with the apparatus and language of science and more likely to be scientifically-aware.

The scientific workplace is also influenced by gender differences, with men more likely to be employed by such firms. This is seen as an unfortunate and unnecessary disparity with an impact not only on the career opportunities of women, but the long term impact on our cultural orientation, technological development, and general view toward science (Weinberg 1990; Walshok 1990).

In Table 2 we see that there is a slight increase in the likelihood to be attentive or mobilized for the environment as the level of the science-related job increases. There is also, however, a large percentage of

the highly educated individuals with science jobs who are not interested in environmental issues.

Another factor which will effect an individual's opinion toward a new science policy issue is their general orientation toward science. Some people are suspicious of science and feel that it has brought on too many changes or conflicts with their religious beliefs, while others are likely to see science as being very beneficial. Individuals who have a positive view of science are more likely to be attentive to science policy issues (Miller 1983a, 1992). Looking at the ATOSS scale of attitudes toward science, there is a hint of a bimodal distribution with people who are attentive to environmental issues falling at the low end of positive views toward science. However, in terms of mobilization, people who feel positively about science are more inclined to participate.

RESULTS & CONCLUSIONS

In Figure 1 the estimation of the structural equation model is presented. Causality is implied as one moves from the left of the path model to the right. The values in the model are standardized Beta coefficients significant at the .01 level or better. The model has an Adjusted Chi Square of 2.0, an Adjusted Goodness of Fit of .99, and a Root Mean Square Residual of .03. An R^2 of .30 was obtained for the attitudes toward organized science scale, .46 for the environmental knowledge scale, and .10 for the measure of mobilization. Clearly this R^2 indicates a less than desirable explanation. Nonetheless, interesting relationships do occur in the model, and an explanation for the low overall fit will be offered below.

In order to facilitate discussion of the complex path model, the direct, indirect and total effects for each of the variables are presented in Table 3. The variable controlling for the year of the survey had no indirect effects on any of the other variables in the model. A significant direct effect was present to the outcome variable. The negative value (-.10) indicates that those interviewed in 1992 were less likely to be mobilized for the environment than those in 1990. This could be attributed to decreased mobilization efforts in the later year. The 1992 data were collected after Bill Clinton had won the election, and the expectation was that the new president would enact policies more favorable to the environment than was the case under George Bush. Studies of environmental participation during the Reagan years have shown people more likely to be active when the perception is that the executive branch is not in touch with the environmental goals of the citizens (Dunlap 1989; Mitchell 1990). With the Clinton-Gore administration openly prepared to undertake environmental reform there was no longer a perceived need to rally the public to fight for environmental protection.

Respondent gender has a direct, positive path (.10) to the mobilization variable, indicating that women are more likely to be mobilized when the other variables in the model are accounted for. The total effect of gender is only .05, however, as there is a very strong gender effect to environmental knowledge (-.25). This suggests that men are much more likely to be environmentally knowledgeable than are women. Contrary to expectations, there is no path from gender to science job.

The hypotheses regarding marital and family circumstances are supported in the model. We see that marital status is strongly associated with mobilization as married people are more inclined to participate. Similarly, individuals with children under age 18 living at home are far less likely to be attentive and mobilized for the environment (-.21). We do see a strong positive impact on science museum yisits (.17), but with this path considered, the total effects of children at home is a negative -.18.

Formal math and science education is one of the strongest variables in the model, with positive paths to science museum attendance (.19), science occupation (.50), attitudes toward science (.45) and

environmental knowledge (.44). No residual path remains to the mobilization variable indicating that the effects of this background variable are accounted for by the other intervening variables in the model. The total effects on mobilization is .11, indicating that whether or not someone has a strong science and math background is predictive of their participation in science policy issues.

The scale measuring attitudes toward science is predicted by science and math courses as well as informal science education. People who have both the formal and informal background in science are likely to view science and technology positively. This attitude toward science has an impact on knowledge, suggesting that people who do have a positive view are more likely to be knowledgeable about environmental issues. The total effects on mobilization are low (.06) but still positive, indicating that scoring high on the attitudes toward science scale is likely to encourage attentiveness and participation for environmental issues.

As mentioned, environmental knowledge is predicted by gender, formal math and science education, and attitudes toward science. A fair amount of the variance is predicted (R^2=.46), and this variable in turn is the strongest predictor of the outcome variable (.22). Knowledge and informal science education account for the greatest amount of the explanation of the mobilization variable.

The most striking result of this analysis is the low explanation of mobilization for the environment provided by the variables in the model. Similar models for other science policy issues have provided better explanation. Clearly there are additional variables which could be included in the model, but due to consistency of questions across years, noteworthy measures such as efficacy, and stronger media questions were unavailable (magazine, science magazine, and newspaper readership are components of the attentiveness scale). Still, the explanatory variables used in this model are stronger when explaining attentiveness to other science policies than they are for environmental issues. One possible explanation is that environmental issues have been successfully integrated into public life, and that this issue area is no longer similar to other science-related issues. Variables that explain science-based policy attentiveness do not explain environmental attentiveness.

Unlike other science policy issues, and surprising analysts of public opinion, environmental concerns have achieved and maintained a higher level of public attention and awareness than might be expected (Downs 1972; Dunlap 1989; Mitchell 1990). In trying to explain this, some scholars have suggested that it is part of the shift in the United States to a "post-material" or "post-industrial" culture (Inglehart 1977, 1990; Vig and Kraft 1990). Under this model, the citizens and the government can be less concerned with the basics needed for survival such as economic stability and national security. Instead, they make decisions that consider quality of life issues such as the environmental impact of their policies (Vig and Kraft 1990). Others claim that environmentalism has become an important social value, and that the people will continue to monitor government activity, and press for policy and lifestyle changes that are in line with these principles (Milbrath 1984; Dunlap 1989; Mitchell 1990; Rosenbaum 1991). Dunlap (1989) says that environmentalism has become a "consensual value." But, he also points out that it has a passive consensus; there is widespread, yet not very intense public support. In Table 1 we see that next to issues about new medical discoveries, issues about environmental pollution have the greatest number of people who state they are very interested. Thirty-two percent are very well informed, and 20 percent of the population are attentive to the environment. These percentages indicate that more people claim to be interested and aware about environmental issues than about most other science policy areas.

The people interested, informed, and mobilizable for the environment are different from those who have similar commitment to other science issues. Environmentalism has been described as a "populist science" because of the coverage the media has given it, and more people are likely to consider themselves

as being informed (Rosenbaum 1991). We would therefore expect to see a broader range of people who are mobilizable for the environment, and therefore less easily predicted by the more typical variables associated with science policy attentiveness.

APPENDIX A

VARIABLES INCLUDED

The following variables are part of the Science Indicators data set, and will be utilized in this study.

Year of study is entered to control for whether the data were from the 1990 (0) instrument, or from 1992 (1).

Gender was coded as "0" for males and "1" for females.

Age. The respondents were asked, "In what year were you born?" The responses were collapsed into five categories: "1" 18 through 24; "2" 25 through 34; "3" 35 through 44; "4" 45 through 64; and "5" 65 and older.

Marital status. Respondents were asked whether they were married, divorced, separated, never married, or widowed. The variable is coded as "0" for not married, and "1" for married.

Children living at home. Respondents who are currently or at one time married were asked whether they have any children under the age of 18 living with them. The variable is coded "0" for none, and "1" for one or more.

Mathematics and science education represents a combined measure of general level of education and math and science education. A three-level science and mathematics education index was created, coded as "0" for four or fewer high school math and science courses, "1" for five to eight high school courses, and "2" for five to eight high school courses as well as some college math or science coursework. An education variable is also available, coded as "0" for less than high school, "1" for high school diploma, and "2" for a baccalaureate degree or higher. The two measures were multiplied together, creating a measure ranging from zero to nine.

Informal science education is an index which measures the frequency with which the respondent visited a natural history museum, a science or technology museums, or a zoo or aquarium. One visit received a score of one point, while two or more visits counted as a score of two. These values were added for the three types of museums, resulting in a scale of 0 to six.

Science job. Respondents were asked, "Last week, were you working full-time, working part-time, going to school, or what?" All individuals who were working, or unemployed and looking for work were then asked, "what kind of work do/did you normally do?" The response was entered verbatim, and later coded using the three-digit 1970 Bureau of the Census occupation classification. For this analysis, the variable science job was coded in the following manner: "0" non-science job; a scientific or technical job with: "1" a high school degree or less; "2" a Bachelor's degree; and "3" a graduate degree.

Attitudes toward organized science (ATOSS) is a scale based on responses to the battery of questions which began:

> Now, I would like to read you some statements like those you might find in a newspaper or magazine article. For each statement, please tell me if you generally agree or disagree. If you feel especially strongly about a statement, please tell me that you strongly agree or strongly disagree.

The following four questions were used to create the ATOSS scale:
"Science and technology are making our lives healthier, easier and more comfortable;" "The benefits of science are greater than any harmful effects;" "Science makes our way of life change too fast;" "We depend

too much on science and not enough on faith."

One point was given for agreeing or strongly agreeing with the first two statements, and disagreeing or strongly agreeing with the last two questions, resulting in a scale ranging from zero to four. The measure has a reliability (Chronbach's alpha) of .53, which was used in the LISREL analysis.

Environmental knowledge. The following open ended questions were asked, and the responses coded into categories. "What is the primary cause of acid rain?" "Please tell me, in your own words, why there is a hole in the ozone layer?" "Do you know where the hole in the ozone layer is located? Where is it located?" "So far as you know, are there any harms or dangers that might result from a hole in the ozone layer?" One point was given for each correct response, resulting in a scale ranging from 0 to 4. All of the items loaded on a single factor, and the measure had a reliability (Chronbach's alpha) of .63, which was used in the LISREL analysis.

APPENDIX B - MATRIX OF POLYCHORIC AND POLYSERIAL CORRELATIONS

	Year	Gender	Age	Marital Status	Kids at Home	Sci-Math Courses
Year	1.000					
Gender	.013	1.000				
Age	-.043	.102	1.000			
Marstat	-.050	-.124	.197	1.000		
Kidshome	.020	-.015	-.315	.633	1.000	
Courses	.085	-.238	-.149	.041	.012	1.000
Museums	.013	-.022	-.240	.081	.209	.306
SciJob	-.002	-.152	-.010	.110	.064	.479
Attitudes	.038	-.125	-.125	.081	.074	.328

Museums	1.000				
SciJob	.104	1.000			
Attitudes	.220	.182	1.000		
Knowledge	.201	.236	.275	1.000	
Mobilized	.180	-.001	.010	.171	1.000

TABLE 1

Specialization (interest, informedness, and attentiveness) in Selected Public Policy Issues, 1990.

Public Policy Issue	Very Interested	Very Well Informed	Attentive Public
Issues about new scientific discoveries	39%	14%	8%
Issues about new medical discoveries	68	24	16
Issues about the use of new inventions and technologies	39	11	7
Issues about the use of nuclear energy to generate electricity	42	12	8
Issues about space exploration	26	11	6
Issues about environmental pollution	64	32	20
Economic issues and business conditions	51	25	17
International and foreign policy issues	48	22	14
Issues about military and defense policy	55	26	17
Agricultural and farm issues	24	13	6
Local school issues	50	32	27

N = 2033

Question wording:

"There are a lot of issues in the news and it is hard to keep up with every area. I'm going to read you a short list of issues and for each one--as I read it--I would like you to tell me if you are very interested, moderately interested, or not at all interested. First, . . . "

"Now, I'd like to go through this list with you again and for each issue I'd like you to tell me if you are very well informed, moderately well informed, or poorly informed. First, . . ."

THE IMPORTANCE OF IMPORTANCE:
REASSESSING PUBLIC POLICY CLASSIFICATION

Philosophers and methodologists often observe that political science, like other social sciences, has not made the sort of progress promised by its commitment to the "scientific" method.[1] It is clear, for example, that, even after decades of unrelenting effort, the discipline is no closer to discovering "laws" of politics or political behavior than John Stuart Mill and his contemporaries were more than a hundred years ago. Moreover, political science's explanatory and predictive[2] successes have been modest compared to the achievements of the natural sciences. Finally, it has accumulated volumes of findings without creating a body of cumulative knowledge. And even if one accepts a different methodology, hermeneutics, say, or believes that political science should not attempt to be more than a descriptive enterprise, the number and type of unanswered substantive questions must be distressing.

A widely studied and debated situation, one has little trouble finding reasons for its existence. Considering a single aspect, this paper argues that among the major obstacles to understanding political phenomena--however one construes understanding--is the absence of a clear conception of what is an important political policy or decision. It starts from the seemingly self-evident observation that some public policies are more important than others. Yet when one begins to reflect on this commonplace--to ask what importance means, to rank policies in order of importance, and to explain and justify this ranking--problems emerge, first slowly, then with great rapidity. Reading the literature from any branch of political science suggests that the vast majority of authors take the importance or salience of the policies they discuss for granted.

Needless to say, public policy has been categorized in numerous ways. The most common and perhaps logical classifications use manifest content. But these schemes frequently miss what may be of most interest, namely which

---

[1] Needless to say, the members of the discipline disagree about whether or to what extent political science can or should adopt [a] scientific methodology. Yet a cursory review of its leading journals and the curriculum of its major graduate programs suggests an adherence to the tenets and certainly the idiom of what is commonly thought to be the scientific method.

[2] It's hard, for example, to think of a single major political occurrence predicted by a political scientist.

policies matter most and how one knows that they matter most.[3]

It is surprising that a discipline that spends so much time on measurement, concept development, and theory building has devoted such little effort to thinking systematically and rigorously about what separates important from less important decisions. In so far as importance has been explicitly considered most effort has been devoted to two topics: 1) the study of statistical influence in which the question is, of a set of K independent variables, which best "explains" the variation in Y, a dependent variable; and 2) attempts to measure how much significance voters attach to various issues. Although I touch on these efforts from time to time, these sorts of analyses are not the subject of the paper. The situation is all the more surprising given that the discipline is so committed to theorizing. For all theories are tied to concepts, and I will argue, most theories of government and political behavior in one way or another involve claims about policy importance. Yet we lack accepted (or even debated) criteria for comparing the significance of events or policies.

This paper has three main goals. Its primary objective is to show how the lack of orderly reflection about importance adversely affects understanding politics. In particular, it is unlikely that many problems and controversies will be resolved without the disputants agreeing on what constitutes a significant policy. I next want to take an admittedly unsteady step toward a classification of policy that incorporates a concept importance. The scheme I develop suggests that many policies can be related to each other in a hierarchical fashion that both raises and answers interesting questions. In the process of developing this categorization I will discuss other policy classifications and some of the major philosophical issues that arise. Finally, I want to apply the framework and analysis of it to the substantive problems address in the beginning. This undertaking will reveal the shortcomings of the project but (I hope) its possible benefits as well.

At the outset I should emphasize that I approach this problem not as a policy analyst but as a general student of government. As a matter of fact, I stumbled on the issue while thinking about the public's role in making national security policy. A persistent problem has been who does, who can, and who should make the life and death decisions regarding war and peace. These questions, I discovered, cannot be answered without first sorting policies into levels of importance.

---

[3] I don't wish to be misunderstood. Policy analysts compare policies all the time. But the comparisons usually pertain to, as an example, the impact of policies in a relatively narrow domain on a particular type of behavior.

WHY IMPORTANT IS IMPORTANT

To say that political science does not spend much time on conceptualizing about importance does not mean theorists do not have definitions or ideas in mind. The difficulty, as I intend to show, is that these conceptions are more often than not left unstated, taken for granted, not questioned, or based on what is believed to be common understanding. But this uncritical attitude affects one's view of how political systems works, who governs them, their capacity to solve problems, their stability, and similar topics. The point is best made by looking at a few examples of substantive research programs.

Institutional Performance: I defer discussion of what is perhaps one of the best analyses of institutional performance, David Mayhew's Divided We Govern, until later since it does explicitly and at length deal with the question of policy importance. In the meantime, consider James Lindsay's Congress and Nuclear Weapons, a book that begins by asking "Does Congress Matter?" in making nuclear weapons policy and answers with an emphatic yes: "...Congress today is a player in nuclear weapons policy." (Lindsay (1991), pp. 3, 144.) Lindsay finds that since 1970 members of Congress often "care about substantive issues surrounding weapons programs" rather than simply acquiesce to the executive branch's demands or toady to constituent wishes. They are, he contends, genuinely interested in and motivated by policy content. His research, which I believe to be indicative of the type and level of scholarship on this subject, makes an altogether convincing case for the proposition.

Nevertheless, in assessing this argument we need to keep several points in mind. First, although he is fully aware of the distinction, his analysis nevertheless conflates procurement decisions with strategic doctrine. Yet the two are of course very different. Procurement refers to the whether particular weapons systems should be funded and at what level, whereas strategic doctrine involves issues of how in general the United States should meet threats to its security. Logically, procurement follows strategy.[4] The distinction is pivotal because, for example, a "counterforce" nuclear posture (an ability to attack hardened military targets) costs much more than a minimal deterrent (the capacity to destroy only cities). Consequently, if Congress tacitly or unquestioningly accepts the need for a counterforce capability and merely debates how many dollars will be spent on which missiles and bombers, can we say that it has as

---

[4] I do not mean to imply that policy is always rationally developed. A decision to procure a weapons system could be made for reasons other than strategic doctrine and then "sold" as a means to implement some strategy.

much "influence" as if it explicitly and intentionally chose the strategic policy in the first place?[5] A primary question, then, is how much of Congress' supposed power is confined to appropriations decisions and how much to issues of strategy.

A second, and closely related point, is that Lindsay often fails to distinguish between a specific weapons system and the overall strategy underlying its intended use. For instance, he finds that Congress "played a critical role in the evolution of the MX missile program." (Lindsay (1991), p. 69.) Lindsay makes the point by showing that representatives and senators had a decisive voice in where and how many missiles would be deployed. But however bitterly debated these decisions, what really counted, one might argue, was their place in the U.S.'s overall deterrent posture and the plans for using them.

Designed to be capable of launching 10 warheads with great precision, the MX, the Air Force hoped, would be able to strike Soviet long-range weapons. But, as Lindsay notes, critics complained that the missiles would have a destabilizing first-strike capability. Despite these concerns, however,

> ...Congress's objections to MX revolved around the basing mode and not the missile itself....arguments about the destabilizing effects of a larger, more accurate missile did not appeal to many legislators. For most, MX's flaw was that there was no way to make it survivable. (p. 69)

More to the point, Congress apparently did not consider the possibility that had the United States pursued a different nuclear policy (minimal deterrence, as an example), then the need for the MX would have been obviated. Could one not argue, then, that for Congress to have "real" influence it would have to participate actively and decisively in this much more fundamental level of policy planning.

The point of my remarks is not to critique Lindsay's work. Instead, I simply want to illustrate the central point: many policies form a hierarchy in which some are more "basic" than others. And, when comparing and evaluating institutional capacity and performance, one needs a clear conception of what is basic and what is not.

Analyses of Roll Call Votes: The investigation of the voting behavior of legislators or judges provides another example of the

---

[5] Lindsay himself admits that often Congress gets into the game after preliminary and, I suggest, basic decisions have been made: "legislators generally do not intervene in nuclear weapons policy until relatively late in the development of individual weapons systems." Lindsay (1991), p. 62.

value of sorting out policies by their importance. The usual purpose of this research is to uncover ideological dimensions or voting patterns. The most widely used methods entail the aggregation of a series of votes or decisions in a summary index with each choice counting equally. Does this approach present problems? Perhaps. Suppose two votes included in an "internationalism-isolationism" scale are: A, $1 billion for contributions to the United Nations; and B, $200 million for economic assistance to an East European country. Most measures of voting would weight these the same, provided they met standard criteria such non-unanimity and party differences. In many scales a representative who voted for only A would presumably count the same as one who voted for just B.[6] But would this be an accurate portrayal of the individuals' positions? It is conceivable that the relatively small appropriation for foreign aid might be linked to support for a particular regime and that this linkage would possibly have lasting and decisive consequences for American foreign policy. In that case, despite what the individuals themselves think, the second representative might be considerably more "internationalist" than the first. This type of distinction gets lost in summary statistics that do not incorporate an independent conception of importance.

As a further and more realistic example, consider Table 1, showing what editors of The Almanac of American Politics consider to be "important votes...on national issues."[7] In each case a majority of Democrats opposes a majority of Republicans, the usual minimum criterion for inclusion in roll call analysis. Using data such as these one can calculate various indices of party loyalty or liberalism-conservatism. But are these bills equally important? does it makes sense to count them the same? Could one not argue that the last, the decision regarding the balanced budget amendment, is (potentially at least) of far more import than the votes on increasing medicare taxes or freezing

---

[6] A Guttman-type scale might pick up the difference, depending on how the legislators viewed these and other issues. (A summary scale would not.) But, in any event, Guttman and similar techniques do not address the problem I am raising since they ultimately measure people's behavior or thoughts about stimuli. I, on the other hand, want to create a more "objective" device.

[7] Barone and Ujifusa (1991), p. xviii. Admittedly, most investigators do not use this particular list. But they frequently analyze ADA ratings, which contains the same or virtually the same bills. As an example, the items in Table 1 overlap markedly with the ADA's 1990 selections. ADA(1991). For a recent and typical example of roll call analysis that uses the ADA's index see Fleisher (1993). Incidentally, the editors of the Almanac do not define "important votes."

aid to El Salvador? Adoption of the balanced budget amendment, it seems clear, would greatly constrain possible actions in many other areas were it enforced seriously (admittedly a major qualification). Adherence to its provisions would perhaps preclude spending money on SDI, El Salvador, and abortions, regardless of these projects' intrinsic merits.

Clearly the choice of items or votes also affects overall measures of party cohesion. Take the House Democrats. The average odds over all 12 votes of a member voting with the party majority is 7.04. This figure weights each vote equally. But suppose, for reasons stated above, the balanced budget amendment were considered, say, 10 times more important than the others.[8] The weighted odds then drop to 4.59. If it were 50 times more important, the odds would decline further (to 2.44), thereby changing one's opinion about loyalty among Democrats. The different results would be especially noticeable in a longitudinal or comparative study. Suppose, for instance, during 20 sessions Congress dealt with legislation similar in importance to items 1 to 11 in Table 1, but in its next term voted as well on a significant bill like the budget amendment. One might detect a precipitous decline in party cohesion when in fact this drop would be an artifact of the selection of roll calls.

Looking at individual representatives further clarifies the point. Tom Carper (DE) had the same overall "loyalty" score as many of his fellow Democrats, 11 out of 12 on this series. But the overall total obscures an important difference: Carper's "defection" was on the balanced budget amendment, which he supported, whereas representatives such as Frank (MA), Smith (FL), and Rostenkowski (IL) along with numerous other Democrats who scored 11 out of 12 voted against the proposed amendment and deviated from the party on other issues such as abortion funding or aid to El Salvador.[9] If, for the sake of argument, we consider opposition to the balanced budget amendment, the passage of which might threaten programs commonly associated with heart and soul of the Democratic party, then Carper could be regarded as considerably less "loyal" than his colleagues with the same total.

Once again my point is not to critique any particular work or approach but only to suggest that, even if convenient, counting roll call votes (or court decisions) equally or simply classifying them by manifest content may produce a misleading

---

[8] This factor is of course only hypothetical. I do not propose or know of a way to quantify importance.

[9] The voting records are readily available in Barone and Ujifusa (1991).

picture of a legislative or judicial body.[10]

Party Differences: Table 1 shows that congressional Democrats and Republicans differ on a range of issues. Still, even "hard" data like these do not address the problem raised by those who say there is not a dime's worth of difference between the parties. Pointing to the party differences in Table 1 does not help unless accompanied by some sort of yardstick of importance. What does a vote for or against slightly increasing taxes of wealthy medicare recipients indicate? Does it represent a principled ideological or philosophical stand or simply reflect group allegiances? Will the outcome, whatever it is, affect the course of the nation's economy, the distribution of wealth, or national competitiveness? Having a workable definition might assist in rendering an opinion about claims regarding party differences.

In the same vein how do we evaluate the sort of thesis advanced by Louis Hartz that American politics is dominated by an all-encompassing commitment to Lockean liberalism? This claim makes sense only if the things American parties do argue about are relatively trivial on a scale of conceivable and possible party differences. It is hard to know, it seems to me, without some sense of what constitutes important policy alternatives.[11]

The comparison of American parties with those in other democracies also depends on how we come to grips with this problem. We can obviously look at organization, function, patterns of leadership recruitment, financing, and similar factors. But probably what is of greatest interest is the kind or magnitude of programmatic choices the parties present voters. European countries have long-standing socialist, liberal, centrist, corporatist, and conservative traditions. Does this fact mean then that voters there have a wider choice of among potential policies? Only with a criterion of importance can one tell.

---

[10] Indeed, some studies do carefully sift the substantive content of votes or decisions before including them in an analysis. See, for example, Schneider (1979).

[11] Most efforts to measure political differences rely on voters' perceptions of where the parties stand. Yet one can question how reliable this method is. After all, the electorate's perceptions are subject to manipulation--that's what campaigns try to do--and are affected by the media that tends to inflate party conflict in order to create drama. (On the press' tendency to dramatize news see, among countless others, Bennett, 1983.) But can we make assessments independently of what citizens think are important?

A closely related problem is the interpretation of elections. Most analysts do not see American elections as policy mandates. (Ladd, 1989, 1981) Nevertheless, at times they do appear to put to rest a long standing controversy. According to Robert Griffith, Truman unsuccessfully pushed for national health insurance during his last four years in office, but Eisenhower's victories in 1952 and 1956 effectively removed the issue from the national agenda for at least the next two decades. (Griffith, (1989) In judging the impact of the change of administrations we might believe that an election was of momentous consequence if we feel it resolved a "key" issue. If, on the other hand, we regard the policy changes as only incremental our impressions might be very different. Griffith, to pursue the example, sees the Truman years as a watershed era in American history because so many important events (important in his eyes) transpired. (Griffith (1989), p. 60.) Yet others could argue that the Truman presidency merely solidified decisions made during the New Deal and World War II. Once more, a disagreement of this sort can only be bridged after reaching a common understanding of what counts as important.

Political Power and State Theory: Lowi showed more than two decades ago that one's judgment of who wields power will be affected in large part by how one classifies the policies that are the subject of conflict. (Lowi, 1964) Although his classes did not specify importance in the sense I propose below, his work clearly demonstrated the relevance of policy classification for theories of power and governance. To see the connection recall the debate between pluralism and elitism about the distribution of political power in the United States.

Pluralists, of course, maintained that since many hands held the reins of power, certainly single no group, class, or elite dominated policy making. They justified this assertions by pointing to studies of concrete policy making in various settings, studies purportedly showing that power is situationally or contextually determined; that a group's influence is usually limited to a particular domain; and that a group fortunate to "win" at one time may not be so successful at others. (Dahl, 1963) The naive power elite school, by contrast, asserted that the politics at local and even national level was dominated by a unified power elite.[12]

How could political scientists and sociologists sort out these arguments? Robert Dahl's seminal paper (Dahl, 1958) proposed a three step process: look at a <u>series</u> of diverse controversies; for each identify the members of the opposing sides; and finally tally the winners and losers. Simple, direct,

---

[12] See Hunter (1953) and Mills (1956) for classic examples.

and presumably rooted in scientific empiricism, the method supposedly provided an objective way of discovering who had power. Bachrach and Baratz (1962, 1970), in their well known response, raised the possibility that some potential or actual conflicts ("non-decisions," they called them) never come before governing bodies and hence winners and losers could not be determined. Their approach in turn provoked the charge that non-decisions, not being observable phenomena, can not be studied "empirically" and hence scientifically. (Polsby 1963)

In view of my concern with importance an obvious comment comes to mind, one that carries over to more general and sophisticated state theories: a judgment about the distribution of power must rest on the type of matters over which one believes a given set of decision makers prevails. For it is one thing to have the final word on, say, industrial policy; it is quite another to decide how much funding to provide public television.

It is noteworthy that many of the most elaborate state theories exhibit methodological similarities.[13] They attempt to explain the emergence and persistence of an economic-political system and especially the government's role in the process. Furthermore, they establish their claims by looking clusters of policies since a constellation, rather than a single policy, partly defines a system type. Naturally, however, they have to examine specific policies such as the Wagner or Social Security Acts. The assumption (and it is an often unspoken assumption!) is that the particular case being examined will ultimately reveal who holds power and consequently the form or structure of the regime. Disagreements usually arise about who won or lost, not about the selection of the policies to be studied. Or, the authors accuse each other of selectively choosing case studies to bolster their positions. Yet precise and explicit rules for selecting the policies to be studied seldom guide these works. Not having such a rule, though, makes adjudicating the various claims and counter-claims difficult.[14]

Consider, for example, a Marxist or "instrumentalist" perspective. (Domhoff, 1979, 1989; Miliband, 1969) Such a view usually holds that the state serves the interest of a ruling or

---

[13] The theories I have in mind can be lumped into various camps including state autonomy (e.g., Skocpol, 1985; Skocpol and Amenta, 1985; Skocpol and Finegold, 1982); corporate-liberal (e.g., Weinstein, 1968); Marxist (interventionist) (e.g., Miliband, 1969); and neo-Marxist (structuralists) (e.g., Poulantzas, 1978, 1980). Barrow (1993) provides an excellent overview.

[14] For a discussion of this point see Barrow (1993), pp. 48-50.

capitalist class; that the real function of government is to help build, sustain, and legitimate a social structure of accumulation. (Gordon, Edwards, Reich, 1982; O'Connor, 1973) A person committed to this position would, among other things, presumably want to calculate the rate of success of government actions that further ruling class interests. In making this calculation, two types of failures would have to be distinguished: (1) the state adopted the policy, but the dominant class interest was not advanced because the policy was misguided, had unintended side effects, did not work, and so forth; (2) of more interest is the situation in which the ruling class attempts to advance its needs but is thwarted by other classes, an autonomous state, or some other actor. For assessing an interventionist theory this kind of failure would be of greatest concern. Why? Because nine out of 10 losses would not discredit instrumentalism if the successful 10th policy preserves the distribution of wealth and power while the others pertain to luxury taxes, child labor, and other matters that do not challenge the prevailing class' privileged standing and power. In short, the question is whether or not a policy has fundamentally altered or led to the alteration of the distribution of wealth or political power.

This distinction appears to me to be crucial for theories of power and the state. But in order to draw it each policy in the calculation would, I think, have to be weighted by its importance to the class, the state, and society as a whole. (I pursue this claim in more detail later.)

ON CLASSIFYING PUBLIC POLICY

I have argued that political scientists generally do not think explicitly about importance and that in so doing they diminish support for their results or cloud the interpretation of their conclusions. I have also stated in passing and certainly by implication that it is possible to find a more precise and perhaps objective definition of the term. There are two ways of tackling the problem.

First, think of importance as being in the eye of the beholder. According to this view, a policy or decision or party difference is important to the extent (and only to the extent) that people think it is. Resting on common sense, this strategy implicitly underlies most political inquiry.[15] Alternatively, assess importance independently of individuals' judgments by

---

[15] It also fits with the philosophy of interpretive school that argues that social science should concentrate on what events and actions mean to individuals. See, for example, Winch (1958) or Taylor (1979).

developing a set of specific criteria that can be reliably and validly applied by different investigators to a broad range of policies.

I follow the second path. For reasons that will become apparent, I reject the notion that importance is a matter of personal opinion or common sense. On the contrary, I take the stance that policy importance can be "objectively" defined and observed. Before explaining, however, I would like to comment briefly on David Mayhew's Divided We Govern, a work that, in a sense, uses both methods.

His book merits attention because it is one of the few that systematically attempts to define importance. Indeed, his thesis--that divided government gets things done--rests partly on being able to classify by congressional actions in terms of their significance.[16]

Mayhew suggests that important polices are "innovative" and "consequential." The problem, of course, is the meaning of the concept is shifted to two new, potentially equally vague terms. How, then, can innovative and consequential be interpreted in a way that one can reasonably expect independent observers apply in the same way?

To solve the difficultly, Mayhew relies on a "reputational" method somewhat akin to the first strategy mentioned above. In order to enumerate the "important" acts of Congress from 1946 through 1990, he "sweeps" through the period twice:

> The first [sweep] picks up judgments that close observers [i.e., journalists and commentators] of each Congress made at the time about what enactments...were particularly notable. The second picks up retrospective judgments that policy specialists have made, looking back over many Congresses, about what enactments in their own policy areas have been particularly notable. (p. 37)

Importance, then, is "operationally" defined as what specialists of one type or another believe is important. Questions immediately come to mind. Do the specialists use the same standard? Do they share a theoretical perspective? Mayhew augments this reputational approach by using "mentions" or citations in newspapers indexes. For some purposes this tactic is unassailable. Mayhew wanted to explore a particular hypothesis: divided government hinders policy making. He examined bills passed by Congress and kept track of the attention the press gave them. He deemed those that received some minimal level of

---

[16] I am only concerned with his discussion of legislation, not congressional investigations.

coverage as important. But again one may ask: is what dominates the news always more important than decisions and policies made out of the public's view. His approach amounts to equating a protracted fight, over whatever issue, with importance. For many purposes, including Mayhew's, this technique may be defensible. But by other standards it may be less so.

One possible difficulty with this interpretation is that it excludes "agenda-setting" effects. As an example, Mayhew's list (sweeps 1 and 2) for the Truman years includes, among others, these bills:

> **Domestic:** Income tax cut; Social security expansion; Tax increase.
> **Foreign affairs and national security:** Greece and Turkey aid; Marshall Plan; NATO ratification; Mutual Defense Act; Point Four foreign aid program; Defense Production Act of 1950. (Mayhew 1991, Table 4.1.)

Note, however, that in each instance these policies implemented (by expanding or putting into force) prior decisions. For purposes of determining what is really consequential shouldn't the prior acts, which in many ways dictated the content and form of the subsequent ones, have to be considered more important. Foreign aid, for example, became essential in the wake of the decision to contain the Soviet Union[17] or, as some argue, establish American hegemony.[18] Mayhew, of course, was not concerned with this line of analysis and so his classification is satisfactory for his purposes. But, in general, the agenda-setting effects of policy ought to be a main component of any conception of importance.

Also note that because of the nature of his objectives Mayhew's method does not reveal decisions or enactments that did not pass Congress. Either a reputational or objective classification might deem these "failures" as or more important than the successes. (Examples from the Truman years could include the Brannan plan to reorganize agriculture (Griffith, 1989, p. 75.) and the Wagner-Murray-Dingell bill to create a national health insurance system and expand Social Security (Lictenstein, 1989, p. 152.).) Moreover, the critics of divided government worry that national problems fester while the parties struggle for electoral advantage. Hence, counting the number of things Congress does may miss the point of the critics' concerns. It is what Congress does not do that bothers them.

Finally and unavoidably, his list omits legislation that

---

[17] See, for example, Gaddis (1982).

[18] McCormick, 1990 takes this position.

others "specialists"--working perhaps from a different conception of importance--consider noteworthy. Continuing with the Truman administration, the historian Robert Griffith would no doubt add the so-called Bulwinkle bill "to exempt such practices [railroad organizations that set rates, routes, etc.] from the antitrust laws"; the Cellar-Kefauver amendment to Clayton Act that forbade restraint of trade "through the acquisition of assets of one corporation by another"; and modification of the Atomic Energy Act to exclude "the federal government from the development of nuclear power and ensuring that the new, nuclear-based technologies would be almost exclusively controlled by large private utilities." (Griffith, 1989, pp. 75, 76, 82; Fligstein 1990)

My purpose here is not to criticize Mayhew's enumeration but to suggest that relying on expert testimony seems likely to lead to this type of problem unless the judgments flow from a common understanding of importance. Note, however, that in spite of this difficult, it may be hard to improve on his results.

A CLASSIFICATION BASED ON IMPORTANCE: A FIRST STAB

To make sense of the proposed classification, I should describe some of its philosophical underpinnings. The purpose of classification, naturally, is to bring as much order to a field of study as possible. Biologists disagree about whether or not a classification should be purely descriptive--an information storage and retrieval device--or driven by and related to a substantive theory.[19] My scheme attempts to maintain the first, the descriptive, "attitude," but may in fact be more appropriate to a theory of governance. Whatever the case it tries to enhance the understanding of politics.

My argument that policy importance should play a greater role in policy analysis assumes a methodological stance. In particular, it rests on the premise that one can somehow independently, objectively, and systematically compare polices along this dimension. Acceptance of this point of view implies a commitment to realism. There is, on this view, a "real" world that one can in some sense know; that actions occur in it; and that these events can be compared by reference to their effects on other actions. It is therefore meaningful to compare policies. Furthermore, these comparisons are not simply a matter of taste or the product of a specific context or ideology. (At least, no more so than taxonomies in any science are.) To adopt this position, in other words, is to be advance the proposition that individual (or collective) judgments need not be the defining criteria of importance.

---

[19] See, for instance, Scott-Ram (1990).

This stance will doubtlessly upset those who claim that the goal of social science should be the understanding or interpretation of individuals' reactions to and thoughts about matters such as government and politics. An effort like mine is, they maintain, doomed from the beginning for there is simply no way to examine political phenomena independently of people's beliefs about them. Since space does not permit me to discuss, much less resolve, this difference of outlook, all I can do at this point is state my position.

In addition, I assume that policies share properties. Of course, this statement does not mean that they are not unique in various senses. But, just as the members of any population of organisms, bacteria for instance, exhibit common traits along with differences, so too policies share characteristics. Indeed, it is precisely this commonality that allows humans to classify objects at all. If this observation appears too obvious to warrant discussion, it at least directs attention to the need to identify the properties that are most meaningful or theoretically interesting and informative.

Not being a specialist the field, I should clarify my understanding of the term policy. A public policy is a rule or set of rules that determines or attempts to determine individuals' behavior. It involves a coercive element. Obviously policies may be self-enforcing to a greater or lesser degree but self-enforcement implies that human beings would not do something unless somehow compelled, so the term a policy carries the implication that it is made binding in one way or another.[20]

To make the case presented below convincing I need to emphasize here that policies are, in the parlance of philosophers of the mind, intentional acts. Put more simply, they are made consciously. This does not mean that they do not have unintended effects for they clearly almost always do. Nor does this conception imply any kind of rationality. Rather I simply mean that they result from affirmative and willful actions based on conscious choices from among alternatives, though unnoticed or unconscious factors may affect the process. A policy is made consciously for a variety of reasons, not all of which the actor may be able to articulate; it is the act of deciding that is crucial. The point underlines the difference between policies and

---

[20] Lowi's thinking (in his classic 1964 paper) would seem to be at variance with mine since he distinguishes between distributive and regulatory policies. But a policy that gives something to someone must, I submit, logically entail a kind of regulation even if the action does not literally take from one person or group and give to another. As with so many other subjects, space limitations do not permit the depth of analysis that this topic deserves.

what I call called "states of affairs."

A **state of affairs**[21] consists of (a) a set of widely shared attitudes among those in positions of authority regarding what political goals the polity should pursue and what are essential, desirable, and possible policy objectives; (b) widespread public acceptance of these values and objectives[22]; (c) a more or less stable division of labor and pattern of roles; (d) a given distribution of wealth and power; and (e) institutions (public and private) to sustain this order. More loosely, a state of affairs embodies "current" economic, political, legal, and cultural conditions. It frequently stems in large measure from the kind of policies described below, but it need not always result from them.

Finally, I find it helpful to define a policy or decision **node**: a node consists a bundle or set of logically, substantively, and intentionally interrelated decisions made roughly simultaneously or consecutively in a relatively short period of time by the same pool of decision makers. These acts are so interconnected that, as discussed later, they can be consider a single policy.

The classification starts with one dictionary definition of importance, a term that connotes among other meanings the power to influence or cause effects. Something is more important that something else to the extent that it has greater power to bring about or produce consequences. In the present context, I deem one policy more important than another if it leads to more subsequent actions and effects. Most readers will, I think, agree so far.

What, then, of the definienda, the phrases containing influence and effects? The number and magnitude of ramifications is the key. Consider policies X and Y. Both entail or require (logically and practically speaking) implementation. (No policy stands alone; it demands at least a minimal set of follow up activities and actions.) The question is which of them necessarily leads to most implementing policies of the widest scope and greatest duration? The answer determines whether X or y is more important in the present sense. This way of looking at importance, incidentally, shoulders no moral or ethical implications: it does not equate importance with worth. My intention is only to develop an analytic tool.

---

[21] Sometimes the word "system" is used in this sense, but that term has so many diverse meanings that I feel it is wiser to use a different, even if somewhat more ambiguous, phrase.

[22] Lowi's notion of "public philosophy" motivate points (a) and (b). (Lowi 1979, Chapter 1)

This interpretation flows from the belief that policies belong to hierarchies. The size of the hierarchy and the policy's place within it determine its importance. Those closer to the beginning of the chain and with most links emanating from them are more significance than those farther out.[23]

Now, using these ideas as a basis, I propose a two-part division of policies, Type I ("agenda-setting) and Type II ("non-agenda setting"). Each type in turn contains sub-types, class A and B policies. (See Figure 1.) What distinguishes the two major classes are their overall ramifications for the polity.

Type I policy: The essence of a type I policy, which may in principle result from a single decision but more likely develops from a policy node, is that it determines a major portion of a nation's political agenda. Consequently, it inevitably compels the making of implementing policies, which I label Class A acts. Type I policies can be recognized by this fact and that their A effects consume a large fraction of society's material and human capital. In so doing, they effectively foreclose other courses of action. Putting the matter another way, the adoption of a type I policy prevents the emergence of another type I policy in the same substantive domain or area. Finally, because of the magnitude of their effects, they are one of the causes of a state of affairs.

Type II Policy: The label "non-agenda setting" suggests policies that do not determine a nation's agenda or create a state of affairs. And since they do not have that effect, they are deemed less important. This kind of policy also requires implementing actions (class B policies) to go into effect. But, as the name implies, they do not set in motion a train of events that comes to control a nation's politics.

Class A and B Policies: every policy requires steps to put it into effect. Depending on whether these actions further a type I or II policy, I label them A and B respectively. Because they exist to serve the needs of policies further up the hierarchy, they are considered "less important" than their "parents." Note too that the members of these classes can be ranked in importance, using the criterion of ramifications described above, so that strictly speaking they should be identified as, say, A_i, A_j, B_k, B_l, and so on. (Example: A_1 might imply A_2, A_3, and A_4 whereas A_4 needs only A_5 to bring to fruition and A_5 consumes comparatively minimal resources. Hence, A_1 is more important than

---

[23] In another place (Reynolds and Vogler, 1991, Chapter 1) I employed the metaphor of a tree to explain the idea. Some policies are so fundamental that they can be thought of as trunks while others of less importance are likened to branches and twigs.

A_4.) Hence, a class A policy, one of the commonest types, is distinguished by its raison d'etat: it serves to sustain, legitimize, carry out, and fulfill the implications of a type I policy. The same idea holds for class B policies; they exist in order to implement type II policy.

In summary, I offer these propositions:

- Type I polices are more important than type II.
- Both types are more important than their corresponding implementing policies.
- Implementing policies within a type can be compared in terms of importance based on the standard of ramifications (their capacity to foreclose alternatives and consume resources).
- Comparing the importance of class A and B policies is more problematic since these classes contain so main as yet undefined sub-categories. In general, however, an A policy would outweigh a B policy.

DISCUSSION

To help clarify the two main classes and their application I will quickly give a few examples of type I and II and class A and B policies. At this point I cannot fully justify the categorizations but will attempt elaborate a bit later.

It might be apparent by now that I regard containment, a decision node made in the years between 1946 and 1950, an excellent example of a type I policy. Containment was the decision to accept the premises that the Soviet Union sought to expand its power and promote international communism; that these objectives threatened American interests; that only countervailing pressure constantly maintained along the periphery of the U.S.S.R.'s borders and elsewhere would dissuade the Soviets; that accommodation with them was not possible; and that various diplomatic, economic, and military means would have to be employed for a considerable number of years.[24] Acceptance of containment drove nearly all of America's postwar foreign and national security policies. Accordingly, I would place what are normally considered major policy initiatives--NATO, the Marshall plan, participation in the Korean and Vietnam wars, the construction of a counterforce nuclear arsenal, among many others--in class A since they were designed to realize the purposes of this more fundamental decision. It was truly a

---

[24] Among the scores of books that describe the emergence and meaning of containment Gaddis (1982) is outstanding. For a convincing argument that the basic outlines of American postwar policy were set by 1950, if not earlier, see Yergin (1977).

national agenda setting policy.

Figure 1 suggests other examples of type I policies including the Federal Reserve System's major monetary actions such as its October 1979 decision to slam the breaks on the money supply to wring inflation out of the economy; effectively uncapping entitlements in the late 1960s; and the tax cuts passed in the summer of 1981, all of which had a lasting and many argue devastating impact on federal and state budgets. The present fiscal situation, as much as any factor, constrains public programs. The Supreme Court's the 1954 desegregation decision also seems an obvious candidate. The list is hardly exhaustive, but, by my standard, a complete enumeration would still be far shorter than Mayhew's. It is also apparent that type I policies are made in different branches of government by elected and non-elected officials.[25]

On the other hand, I regard Roe v Wade as a type II decision, not because it has not dominated public and institutional attention or because it doesn't touch innumerable lives, but because it does not close policy alternatives over a wide spectrum of areas. Clearly, the many laws and court decisions taken in the wake of the Court's decision fall into class B policies. One might regard the determination not to propose a constitutional amendment banning flag desecration and the "large science" projects such as the super-conducting super-collider as other instances of type II policies.

The main point, and one that helps resolve some of the substantive problems mentioned earlier, is the idea that a type I policy dictates the essential form, scope, and content of a huge number of subsequent national actions. It sets the agenda in at least two senses. First, and most important, as with containment, it establishes a national program that stimulates sustained public and private action over (at a minimum) several years and in many areas of life. One might say it sets a chain of events in motion that defines an era. Second, type I programs provide a mechanism or shield for legitimizing the adoption of other programs. Some projects (the space station, for instance) arrived on the scene for various reasons but were justified as furthering American security interests.

The effects of a type I policy cut across traditionally defined policy areas so it cannot be pigeonholed as simply "economic" or "social" because it may have implications for both. Partly for this reason I maintain that it alone or in combination with other factors contributes to the emergence of a state of

---

[25] Quite a few, I would argue, are made out of the public's view and with the great involvement of private (i.e., non-state) actors.

affairs.

To qualify as a type I policy it is not necessary for its creators to be fully aware of all of the implications of their work. For having such foresight is impossible, even with considerable thought and wisdom. Yet they must be cognizant at a minimum that their decision will not be the end of the matter; that additional actions will be of necessity be forthcoming; and that their decisions will inevitably have national ramifications.

The claim that type I policies are in some sense more fundamental than the others does not imply that certain individuals will not feel strongly, even passionately about matters categorized as II or A and B. (The controversy over abortion makes that clear enough.) But, as I suggested previously, determining importance is not a matter of calculating an average intensity of opinion. Instead, it requires judgments about the consequences of programs or decisions and about what things can and cannot be done as a result of them.

However monumental, type I policies do not necessarily attract press attention or public notice. Nor are they necessarily the subject of partisan debate. Policies lower down the scale are usually more visible because their creation and implementation constitute the workaday activities of the political system, and they frequently carry the highest "price" tag. In fact, the public (and often the political and scholarly communities as well) normally gives them the most attention. Mayhew's listing of "important" congressional enactments, but which I regard mostly as A and B policies, shows how preoccupied Congress, interest groups, the electorate, and the media are with these types decisions.

Failure to enact any single implementing decision does not in and of itself "kill" the agenda-setting policy. Thus, failure to fund a weapons system, even a major one such as the MX, does not spell an end to containment. A type I policy could of course be killed if it received no support over a wide range of areas for a long period of time. (And it would obviously die if replace by another type I policy in the same area.) By the same token, it is conceivable that an implementing decision could, because of its repercussions, cause the death of its parent. The disastrous conclusion of America's war on Vietnam, a decision widely interpreted as a form of containment (Gaddis, 1982), could have forced the United States into another basic posture toward the Soviet Union. Some analysts say that the War had exactly this effect, but it seems clear in hindsight that the U.S. continued containment by other means for another 15 years and did not

abandon it until the demise of the Soviet Union.[26]

Non-agenda setting policies by definition have a more limited on what goes on in Washington and the country as a whole. They deal with more or less self-contained matters. The Supreme Court's abortion or flag burning decisions have not structured or constrained economic or foreign or scientific policy they way containment did. Of course, they have to be enforced and administered and thus generate B policies. It is worth repeating that I am using the term importance in a rather narrow sense, though it still accords with popular usage. As a result, those things I have labelled type II may be less significant in my scheme but they nevertheless have the capacity to generate considerable conflict and consume the time and energy of decision makers.

PUTTING THE CLASSIFICATION TO WORK

Classification is the process of devising classes into which one sorts various entities. Diagnosis refers to the actual assignment of particular cases to specific categories. Even if the classification is unambiguous, diagnosis is still an arduous task inasmuch as each individual or group has to be carefully studied. In the present instance, since both the classification is rudimentary and public policy so complex, my diagnoses will be tentative. But they will, I hope, show the value, along with the difficulties, of the effort.

To place a policy or policy node in one or the other group one has to examine the decision in connection with others, always asking what, if any thing, did this policy start and what did it continue or complete? If X initiates a cascade of events, consumes a major portion of the nation's resources, and dominates political decision making over a wide spectrum of areas for a considerable time, one has prime facie evidence of a type I policy. If, on the other, hand the decision can clearly be seen as part of a pattern of events unleashed by previously made policies, it would be thought of as a class A. Or, even if it arouses considerable controversy, but does not commandeer the political agenda and demand major implementing provisions for a prolonged period of time, I would term it a type II policy.

With these thoughts in mind I would like to return to the a few works discussed at the outset. It should be apparent that the

---

[26] We live in an interesting time because containment no longer makes sense but a) it has yet to be replaced by a definite alternative (both the Bush and Clinton administration have sought one); and b) its "effects" (e.g., large nuclear arsenals) are still with us.

congressional activities Lindsay describes--appropriations for weapons development, military basing decisions, and the like--fall into my class A. They represent steps taken to pursuant to a specific conception of national security interests (containment) that dictated not the precise form or content of nuclear weapons policy but its broad outlines. Congress, in other words, worked with (and against) the Pentagon and White House to implement a security policy that had been formulated earlier and elsewhere; it did not construct but worked within a preexisting framework of basic strategic objectives.

What lessons might we draw from the superposition of this classification scheme on Lindsay's (and related) works? For one thing, it appears that even after 1968 the executive branch continued to dominate national security policy. True, Congress became more aggressive in the appropriations process. But these endeavors did not establish defense priorities or goals. That power remained in the White House. Note in addition that the time of heightened legislative involvement in weapons development and procurement coincided exactly with the end of disjointed incrementalism Schick describes (1980). Presumably, representatives and senators no longer rubber stamped Defense Department budget requests. But this form of activism still left Congress a minor partner in the making of fundamental security policy, which because of its capacity to limit alternatives and its heavy impact on the allocation of public resources, has to be considered a type I policy. Seen from this perspective, a cynic might even regard Congress as essentially an administrative arm of the executive branch. In any event claims about a resurgence of congressional authority need to be examined in the light of the relations its actions have to others made elsewhere in the political system.

It might be added that Mayhew's enumeration of important or consequential enactments includes, with some notable exceptions such as the civil rights acts of 1964 and 1965, mostly class A, B, and type II policies. An example: he lists in capital letters, which signifies acts his sources "think reached beyond being important to being historically important," (p. 74) the Marshall Plan. No doubt the Marshall Plan has historic significance. But one can raise two questions. First, in what sense did Congress "enact" the European economic recovery program? One could say that it more or less ratified an administration initiative.[27] Be that as it may, one also reasonably ask where the Marshall Plan

---

[27] Many in Congress (and the public) had reservations about the sustained involvement in European affairs that the Plan implied. Hogan (1987) But these expression of doubts and the fact that the administration had to "sell" is proposal hardly means that the two branches were on an equal footing in deciding the direction of American foreign policy.

fit in the overall scheme of American national security policy. Was it really a brand new initiative that took the United States into uncharted waters or was it a logical, almost inevitable step in the process of implementing containment?[28]

How do the bills in Table 1 fit into the framework I propose. It appears that only one, the proposal to change the constitution to require a balanced budget, could be construed as a type I policy. And assuming its adoption, for it to fall into that category Congress and the president would have to adhered strictly to the letter and spirit of its provisions. If law makers simply moved large programs off budget or routinely voted exceptions, the amendment would have been vacuous. Strictly followed, however, it might well have altered the structure of the welfare state, tipping the balance even further away from public to private measures.

The remaining measures seem clearly to be either type A or B in that they expand or contract already existing programs. Certainly the House crossed no Rubicons with these "key" votes. None of them would have started or ended a major policy initiative. Four (aid to El Salvador and Angola, SDI, and the call for a nuclear freeze) pertained to how best to wage the cold war and implement containment; the request to urge the President to help settle the Eastern Air strike, raising the minimum wage, and altering Medicare dealt with America's long-standing commitment to a quasi-public welfare state. Similarly, votes on the death penalty, abortion funding, and the flag amendment could be interpreted as B or, in the last case, type II decisions.

Can we draw any meaningful conclusions from this analysis? For one thing I think it supports the points made earlier about the interpretation of aggregate measures of roll call votes. Lumping the trivial with the important may be satisfactory for some purposes. But, it seems to me, we learn less about party cohesion and differences than we might think. To play the role of the cynic, one might advance this proposition: Mayhew and others not withstanding, the issues that divide the parties in Congress are so predigested and narrow that they fail to excite the

---

[28] Historians and social scientists such as McCormick (1991) believe that quite apart from containment the United States sought international hegemony. If so, the Marshall Plan, along with all of the other foreign policy initiatives Mayhew lists, should be certainly thought of as class A policies, actions designed to implement this grand design. Whether or not McCormick and others can make their arguments stick is not my concern here. I make the point only to demonstrate the necessity of appropriately typing policies. Once again let me stress that this comment is no way a criticism of Mayhew's work since his ultimate purpose and mine are totally different.

electorate, lead to empty and negative campaigns, belie the lofty and apocalyptic rhetoric of politicians, create a power vacuum filled by the executive, interest groups, and others, and generate mass distrust and apathy. Or, to be equally contentious, consider this proposition: voters seldom have real choices because the parties do not take or at any rate articulate different stands on type I policies. They simply do not have the institutional capacity to develop and "market" them. The items in Table 1 are indicative of what Democrats and Republicans argue about, and they are not sufficiently important to provide meaningful choices.

I would like to conclude by making a couple of observations about state theories. Skocpol and her colleagues examine the origins of social spending in the United States. (See Orloff and Skocpol (1984) and Skocpol and Finegold (1982) for typical works.) They trace the history of old age pensions, industrial accident insurance, health and unemployment benefits, and similar public policies, all of which comprise the core of the modern welfare state. Their studies demonstrate, they contend, the explanatory power of a state autonomy perspective. This model stands in marked contrast to other theories of power and governance such as corporate liberalism (Weinstein, 1968; Lustig, 1982). State managers, according to the theory, have the independence, latitude, and resources to establish and institutionalize social and economic reforms over the opposition of capitalists or other segments of society. For now I have no quarrel with this account (but see among many, many others Domhoff, 1989) except that, as I have repeatedly said, the authors assume the policies they study are sufficient to make their case. And perhaps they are. But consider this possibility. A government can only successfully develop and sustain programs or regulations within a <u>relatively</u> narrow framework, a framework constructed by the decisions and actions made elsewhere by private individuals or groups at some prior time. These limiting factors might include choices pertaining to investment, profit margins, prices, financing, the adoption of technical innovations, corporate structure, and labor relations. If these policies essentially dictate what resources are available for public purposes or effectively constrain the government's options in resource allocation or regulation--I don't claim that they do, only that it is possible--then the state's putative autonomy would be much more limited than the theory suggests. Lichtenstein (1989), for example, asserts that by about 1950 organized labor had largely abandoned its support for a national (i.e., public) welfare system and struck out on its own, negotiating directly with management over health care, pensions, safety, working conditions, and similar benefits. This tactic, it could be maintained, effectively determined, as much as anything state managers did, the scope and nature of America's welfare agenda for a generation.

But how can we know unless we first sort out the connections between various policies (public and private) and arrange them in an order of importance? Then, once that job has been completed, assessing relative influence of various sectors of society may be more realistic and meaningful.

Here is another way to look at the potential value of the reasoning underlying the classification I propose. Many, if not most, theories of the state use domestic policy to make their points. In the case of the United States such a tack seems sensible enough because knowing who writes the laws regarding social security, labor relations, industrial and agricultural policy, and public assistance apparently show who has power and in whose interests the state acts.

For studying postwar America, however, confining one's attention to this range of policies is simply not sufficient. A strong case can be made that the creation and maintenance of a national security state came to dominate every level of American government and politics, at least until the 1990s. This domination has been at one and the same time visible and invisible, widely recognized and badly misunderstood. Naturally everyone pays lip service to the size of the defense establishment and military budgets. But it seems to me that many state theorists who spend so much time dissecting the Congress and presidency underestimate the limits fighting the cold war imposed on domestic policy.

Here is an all too brief example. NSC 68, a policy recommendation drafted under the guidance of Paul Nitze in February and March 1950 and essentially adopted by the Truman administration after the outbreak of the Korean war, led to the "most comprehensive re-armament programme the United States had ever taken in time of peace." (Heuser 1991, p. 17. Gaddis (1982), Leffler (1991), and countless others discuss the origins and implementation of NSC 68.) As a percent of GNP, defense expenditures climbed from 6.9% in 1951 to nearly 14% in 1953. But dollars and cents do not tell the whole story: NSC 68 was part of a process of "militarizing" containment. Hence forth the United States, as President Kennedy would say later, would "pay any price" to defend its interests. Thus, it helped lay the ground work for armed intervention in Korea, Vietnam, Central America, and other places; the design and deployment of increasingly destructive nuclear weapons; involvement in the internal affairs of other countries;...the list seems to go on indefinitely. Moreover, even as the original document predicted and recommended, desirable domestic programs such as education and health had to be postponed or scaled back; taxes raised; and enormous quantities of publicly accessible human and material resources diverted to national defense. Other domestic programs (the interstate highway system and science education, for instance) either had to be or were successfully "sold" under the

rubric of promoting national security.

One can argue in short that NSC-68 was an example par excellence of a type I policy. If this position is correct, if the logic of the classification holds water, then state theorists it seems to me need to spend more time searching for and investigating type I policies and being certain that they are not confused with other kinds. Yet most brands of state theory give decisions like NSC 68 much less attention than the more widely known welfare policies. In short, I believe that any theory of power in American government must begin with an assessment of what impact national security had on internal affairs. Only then will we know who has real power in American society.

Table 1
"KEY VOTES" IN THE HOUSE OF REPRESENTATIVES
ACCORDING TO THE ALMANAC OF AMERICAN POLITICS 1992

House Votes, 1989-1990 (Democratic position)	Demo. split	Rep. split
Eastern Airlines Strike (HR 1231) (For)	232-15	20-152
Override veto of minimum wage raise (HR 2)(For)	227-28	20-150
Increase medicare taxes of wealthy (HR 5835)(For)	228-28	10-164
Fed funds for abortions for rape (HR 2990)(For)	175-72	41-134
Flag amendment (HR 350)(Against)	95-160	159-17
1990 Civil Rights (HR 4000) (For)	240-12	32-142
Restriction on death penalty (HR 5269) (For)	199-36	19-150
Cut SDI (HR 2461) (For)	214-38	34-137
Freeze aid to El Salvador (HR 4636) (For)	219-28	31-135
Urge nuclear test ban talks (HR 4739) (For)	198-44	36-138
Suspend aid to Angola (HR 5422) (For)	195-50	12-156
Constitutional amendment requiring balanced budget (HJR 268) (Against)	**110-145**	**169-5**

FIGURE 1
POLICY CLASSIFICATION

POLICY OR NODE:	MINIMAL CRITERIA:
Type I: ("Agenda-setting")	Sets polity's political agenda Initiates, requires Class A policies Forecloses major policy alternatives National scope Creates a state of affairs
TYPE II: ("Stand alone")	Does not set national agenda Limited scope Does not create state of affairs Initiates, requires Class B policies

Structural Change, Domestic Politics and International Bargaining: Germany and the Uruguay Round of Trade Negotiations

By Carolyn Rhodes
Associate Professor
Utah State University
Logan, Utah 84322-0725

Paper prepared for presentation at the American Political Science Association Annual Meeting, August 31-September 5, 1993, Washington, D.C. Draft. Please do not cite without author's permission. Comments are welcome.

Abstract:

When a nation departs from past patterns of behavior to assume a new policy position in international affairs, it draws the attention of observers and raises questions about why the change occurred. This paper focuses on the abandonment by the German government during the fall of 1992 of longstanding opposition to agricultural reform and its concurrent leadership in pursuing a negotiated settlement with the United States concerning agricultural trade policy. It argues that while the field of international relations theory tends to treat explanations of national behavior in international affairs in "layers" via different levels of analysis, this case illustrates the value of vertically integrating explanations by utilizing a common, conceptual approach which spans systemic and domestic circumstances. To accomplish this the paper focuses on structural change as the key causal variable at both the systemic and domestic levels. It assumes that structural change refers to an alteration in what has previously been a definite pattern of organization in relations between nations as well as within Germany itself. The paper concludes that German policy shifts were made possible by changes that had occurred at the systemic level in terms of power and regime relations and at the domestic level in terms of electoral politics and sectoral characteristics.

Introduction:

On November 20, 1992 a key agreement on agricultural reform was reached between the European Community and the United States. Lauded at the time as a major breakthrough in bilateral disputes during the repeatedly stalemated Uruguay round negotiations, the agreement committed the European Community to changes in the Common Agricultural Policy which went beyond the June 1992 CAP reform package already being undertaken by Member States. Focusing in particular on EC oilseed subsidies and generally on the larger problem of subsidization of unrestricted agricultural output, its aim was to pledge the European Community to a new direction in its farm policy. This new direction would include significant production limits on oilseeds as well as other key products, and was designed to reduce the trade distorting effects of the CAP approach.

The European Commission, negotiating on behalf of the Member States, reached a settlement with the United States only a few weeks before a U.S. imposed deadline would have triggered retaliatory tariffs against the European Community. The dispute over EC oilseed policy had been ongoing since 1988 when the United States filed a complaint with the GATT Subsidies Committee against the practice. After a GATT panel ruled in 1989 and again in March 1992 that the EC's oilseed subsidies had the effect of restricting imports from non-EC countries, the issue moved to the center of the stage in EC-US bargaining over the Uruguay round

reforms. Thus, the GATT panel ruling and US threats of trade retaliation in the midst of these negotiations heightened the urgency of reaching some kind of settlement.

However, systemic level factors--US and GATT pressures for reform--though instrumental to the EC's eventual willingness to reconsider past production and support practices in agriculture, are only partial explanations for the achievement of this tentative agreement. A second and crucial factor was the significantly altered position of Germany in the intra-EC discussions over CAP reform. Germany, in cooperation with France has been consistently a staunch supporter of traditional CAP approaches to agricultural support. However, the German government broke with tradition and past patterns of behavior to move away from France and support Britain in its freer trade, more conciliatory orientation toward reaching agreement with the United States. This marked shift in the German position encouraged the EC Commission to offer a new arrangement for CAP oilseed production and support. This initiative averted an escalation of the trade dispute with the United States, and prevented deepening Uruguay round difficulties at the time. Germany took this unprecedented position against the wishes of France, its traditional ally in this sector. France, in turn, protested the settlement with the United States, refusing to agree to the new arrangements.

The German government supported the Commission's plan in contrast to past patterns of behavior because of domestic changes within Germany as well as systemic considerations. While systemic level factors had created continual pressure on the EC member states (including Germany) to reform the CAP for some time, and the German government considered the successful conclusion of the Uruguay round crucial for its own and Community economic interests, it was not until German unification created new domestic circumstances that the Kohl government was encouraged to move toward reform in this once politically sacred sector.

International Relations Theory, the CAP and Germany's Decision:

There are a number of approaches to explaining why national governments undertake cooperative policy initiatives which differ significantly in direction from past orientation in the international context. These approaches tend to follow the levels of analysis conceptualizatiion of international politics. They have focused, for example, on a range of explanations including the effect of hegemonic leadership, established regime relationships and norms of behavior, complex interdependence and international bargaining, and the roles played by domestic institutions, coalitions and politics. To a degree this paper draws from Robert Putnam's concept that "the politics of many international negotiations can usefully be conceived as a two-level game." As he aptly explains, "at the national level, domestic groups pursue their interests by pressuring the

government to adopt favorable policies, and politicians seek power by constructing coalitions among those groups. At the international level national governments seek to maximize their own ability to satisfy domestic pressures, while minimizing the adverse consequences of foreign developments."[1]

This conceptualization is useful for the case at hand because research reveals that neither a purely internationally focused explanation or an exclusively domestically focused explanation is adequate to demonstrate why a new policy was undertaken by the German government. However, rather than trace coalition patterns through bargaining according to Putnam's schematic, this paper takes a broader direction. Utilizing the factor of structural change as the key causal variable, it reviews the four general theoretical approaches enumerated above and evaluates their applicability to an explanation of Germany's initiative in negotiations involving EC Common Agricultural Policy reform in the fall of 1992. In order to explain the emergence of this new German policy position these four general categories of international relations theory are matched to the circumstances surrounding the German government's actions. In conclusion it is discovered that, not surprisingly, all four approaches when taken together provide a compelling explanation.

1. Hegemonic stability theory.

This theory offers some insight into the puzzle of why Germany, after several years of pressure from the United States, finally decided to alter its policy on agricultural reform. There are at least two ways to approach the German decision from the perspective of this theory. The first concerns the pressure exerted by the United States to penetrate the EC domestic market and to maintain its own share of third country markets against EC subsidized exports. The second concerns the possibility that Germany, long since the most economically dominant nation in the European Community, has finally demonstrated a willingness to assume a more assertive leadership role as regional hegemon within Western Europe. A review of the role played by U.S. hegemonic power in this issue area, as well as a review of the historical role played by Germany in the European Community sheds light on these approaches.

First, let us consider how hegemonic stability theory helps to explain the situation. Since the mid-1970s, the United States, under increasing balance of trade pressure, became more and more interested in exploiting its export potential. In the agricultural sector, this effort brought the United States into direct competition and confrontation with the European Community, which pursued a generous domestic price support policy but offered resulting surpluses at subsidized prices on the world market. Since the Tokyo round of trade negotiations, the United States has pressed the European Community to alter its approach to supporting farmers' incomes.[2] Acting more as a "normal"

trading partner, and less willing to absorb the costs of overlooking EC protectionism and export dumping policies, the US government began to leverage the European Community with GATT complaints, bilateral negotiations and trade retaliation[3].

According to several hegemonic stability theorists, a hegemonic power in decline will begin to pursue policies that benefit its own domestic interests with less toleration for the preferences of trading partners and allies.[4] Whereas the United States had originally sought a waiver under GATT for its own domestic agricultural policies, it had done so in general harmony with its allies who also considered agricultural policy their own sovereign purview.[5]

However, in seeking to liberalize agriculture from the 1970s onward, the United States was reacting to the needs of its own relative economic position at a time when the protectionist practices of the European Community were entrenched. This put the United States in direct conflict with EC Member States who had institutionalized the Common Agricultural Policy within their own state-societal structures.[6] Thus, in its position of relative decline the United States was seeking to reform EC practices for its own comparative advantage, and in this regard it can be argued that U.S. hegemonic decline created the conditions necessary for international pressure against the European Community.

While this may explain in part the origins of U.S. pressure on the European Community to reform its agricultural practices, it does not explain why after over fifteen years of conflict and bargaining the German government has taken a demonstrably different direction in its willingness to compromise to accommodate U.S. demands. The application of hegemonic stability theory to the German situation could provide a plausible explanation. The conditions of relatively open trade and finance established under U.S. leadership after WWII created the potential for West German prosperity.[7]

Well before the 1980s the Federal Republic of Germany was the "richest and most productive" of the twelve member states of the European Community.[8] For decades, historians and contemporary analysts have agreed that the historic bargain struck between Germany and France on the creation of the European Coal and Steel Community depended upon the willingness of German production and capital to support the goals of French leadership.[9] Given Germany's desire to assure its neighbors of its good citizenship and deference to the interests of a united western Europe, the historic arrangement with France was absolutely crucial to the fruition of European integration.

Though regional in context, the German situation by the 1980s had become analogous in many respects to the American situation between the World Wars. Just as the United States had the economic power to take the leadership role after World War I, West Germany had the economic power to do so within the European Community after the 1960s. However, capable in terms of economic resources and influence, West Germany as a polity was not willing

to assume a leadership role that would put it at odds with France. Although West Germany could not be accused of being isolationist as the United States had been during the 1920s and 1930s, it has been reluctant to assert itself in dominating the European Community agenda against the wishes of its important French partner. A complete explanation of why Germany has not been willing to do so requires an in depth historical analysis that would focus on domestic politics as well as international arrangements.

Such an examination is beyond the scope of this paper. However, in the context of hegemonic theory it is apparent that two major external factors and two major internal factors came into play in preventing or postponing German regional hegemony. First, German participation in global and regional politics depended upon the special role conferred on it by the United States in its position as the dominant occupying power after World War II. After 1947 this special role was defined by U.S. containment policy and embodied in NATO arrangements for the defense of western Europe. Moreover, German participation in European economic integration had been facilitated by U.S. cold war policies that aimed, not only at western European reconstruction and development, but also at regional cooperation and legitimization of the role of Germany as an economic and military partner.[10]

Eventually a paradox emerged. The very politics and institutions that allowed West Germany entry as a viable partner in Western European affairs and encouraged its economic growth became constraints on German initiative and behavior. Uncomfortable with German power, its neighbors had found assurance in the international structures to which West Germany deferred, and West Germany had little interest in challenging them.[11] As long as the Cold War raged, West Germany, regardless of its wealth and export capabilities, was limited in the role it could assume regionally, both by the constraints placed on it by U.S. hegemonic policies and by the suspicions and discomfort of its European neighbors.

The second international factor was a product of the first. Given the unconditional surrender of Nazi Germany in 1945, the allies established sovereignty over German territory during the Potsdam negotiations. Even after the two German states had been declared in 1949 and four decades of separate statehood followed, the four wartime allied powers retained ultimate sovereignty over the external affairs of the respective entities. Not until the autumn of 1990 did the four nations involved-Britain, France, the United States and the Soviet Union-transfer their collective sovereign authority to the Federal Republic of Germany in order to open the way internationally for the unification of Germany after the fall of the Berlin Wall and the resulting East German collapse.[12]

Thus, hegemony may help to explain the emergence of West Germany as the richest and most dynamic economy in western europe, as cooperative regimes-the Atlantic and European

Communities-facilitated West German participation. Through 1990 the Federal Republic of Germany generally cooperated with the initiatives taken by the United States regarding defense policy in Europe and in the larger bargain with the initiatives taken by France regarding European economic integration. The end of the Cold War and the achievement of unification, however, changed the Atlantic alliance, altering the character and purpose of the defensive regime and lifting the constraints imposed by U.S. hegemony in the containment policy of four decades. The regimes, created by U.S. hegemony and Cold War rivalry, underwent considerable change, which in turn affected the international environment for German actions. The role of regime norms and rules as well as regime change will be discussed below as we delve deeper into the systemic context of West German policy decisions. Before we turn to regimes, however, it is useful to note that within the logic of hegemonic stability theory there is recognition of the importance of domestic factors in shaping the rise and decline of hegemonic powers.

The two external factors discussed above provide a partial explanation of how hegemonic leadership has affected West German growth in economic power while at the same time influencing West German reluctance to assume a leadership role in west european affairs up to 1990. Internally, two other factors must be taken into account, though they will be addressed more thoroughly below within the category of domestic politics and institutions. First, just as the hegemonic leadership of the United States may have established cooperative regimes within which West Germany could prosper, domestic institutions were established which contributed to West German economic vitality.[13] The rise of West German competitive capabilities, high standard of living, high savings rate, and strong currency were products of domestic socio-economic patterns and institutional characteristics ranging from an historical memory deploring high inflation to a highly independent central bank.[14]

A second factor helps to explain why, despite West German adroitness in the international economy, little willingness to seize the reins of leadership has been evidenced. The trauma of Nazism and the resultant humiliation of total defeat during World War II affected deeply the collective psyche of the West German polity. In West Germany, not only the Basic Law, but also the civic affairs of the national community, have focused since 1949 on the importance of eradicating extremism and on the value of political stability and mainstream politics.

As Russel Dalton has explained, "The first objective of the Basic Law, therefore, was to stress institutional structures that would restrain the excesses of the popular will and mediate the direct influence of the public on politics."[15] This included such institutional provisions as the five percent threshold in the proportional representation system of election to the Bundestag and the positive vote of no confidence. In addition, the new constitution maintained the tradition of regionalism in its federal structure, recognizing the importance of continuity with

the structure of regional governance in the past, and providing generally for the administration of federal law at the local level.[16]

The impact of these domestic institutions will be explained more fully below. Suffice it to say at this point that hegemonic stability theory recognizes that key domestic factors contribute to hegemonic ascendancy and that potential hegemons do not always assume dominant leadership because domestic factors inhibit their willingness to do so.[17] Before we turn our attention to the domestic situation, however, it is necessary to explore two other sets of systemic factors, regimes and international bargaining.

2. Regime relationships and norms.

Regime theorists postulate that international regimes, typified by "rules, norms and procedures around which expectations converge," influence the behavior of otherwise autonomous states by regularizing their contact with each other, establishing expectations of mutual conduct, and facilitating transactions among them.[18] Nations, it is argued, will prefer to cooperate with each other and to allow regime rules to govern their behavior because it is in their interest to do so.[19]

Three very different regimes come into play in the issue at hand, the GATT regime, the European Community, and as a backdrop to the trade issue, the U.S. containment regime in Europe. The GATT regime, established through successive rounds of multilateral trade negotiations, reflects the general expectation among members that trade in manufactured goods should not be encumbered with national restrictions and distortions which discriminate against imports. In addition, the regime, through practice, has also reflected the expectation of signatory nations that when restrictions or distortions do affect another nation's exports, complaints should be given hearing and the dispute settled either through bilateral or multilateral discussions.[20] In this sector a number of cases have been taken through the GATT dispute settlement procedure, but this has not resulted in the incorporation of consistent principles of acceptable behavior. As noted above, agricultural trade was never brought fully within the GATT regime, so although the expectation that trading partners would work toward dispute settlement has been evident in this sector, the complementary norm of liberal trade has not. Thus, expectation convergence has not emerged within the GATT for liberal agricultural trade.

The United States has attempted to assert its leadership in GATT negotiations during the past two decades to convince the European nations and others that the liberal regime should in fact encompass agricultural trade. This has not proven an easy task.[21] While disputes in manufacturing trade between the United States and the European Community have been settled regularly to the mutual satisfaction of the parties involved, agricultural trade disputes have tended to result in stalemate.[22] The GATT Secretariat has made an unprecedented effort to facilitate

Uruguay round negotiations by setting timetables and vocally criticizing the intransigence of the parties involved.[23] Yet, the GATT regime has succeeded only in keeping the negotiators at the table, not in causing them to reach an agreement. Thus, the willingness of the German government to agree to the oilseeds arrangement in November 1992 cannot be explained simply with reference to cooperation within the GATT regime because a long term pattern of noncooperation in this sector characterized Germany's involvement in GATT negotiations to that point.

The European Community can also be treated as a cooperative regime, where expectation convergence around a defined set of rules, norms and procedures characterizes member state behavior. In their self interest member states came together to achieve a common market with institutional mechanisms aimed at facilitating the free movement of people, goods and capital. A cornerstone of EC cooperation has been the Common Agricultural Policy (CAP), which functions to maintain cooperatively established support prices for agricultural goods and to dispose of surpluses on the world market at reduced rates when they occur. Cited for decades as the most successful of the EC's arrangements, the CAP has taken the Community from being a relatively weak agricultural producer and net importer to being a formidable agricultural producer and a net exporter. That this has also produced gross surpluses which must be disposed on the world market at subsidized rates, however, lies at the heart of the dispute with the United States.

Most analysts agree that the European Community is actually something more than a regime. Some point to the supranational character of EC institutions and law, where Community decisions actually supersede national law thereby demonstrating that "the institutional structures underpinning the internal market are more constraining on the behavior of sovereign states than has been the case for other regimes."[24] In the CAP, for example, decisions taken by the Council of Ministers of Agriculture become directives that impose upon member states Community provisions for support and compliance.[25] However, even with this attribute, most major EC decisions are made as a result of intergovernmental bargaining among member states.

Attempting to capture the essence of the EC as being something between a regime and a supranational organization, Keohane and Hoffman have identified it as a "network."[26] This recognizes, for example, the fact that while a there is a "pooling of sovereignty" where, for example, a good deal of initiative can be taken by the EC Commission and an important role is played by the EC Court of Justice in dispute settlement and harmonization of practices, these supranational aspects do not replace the give and take of intergovernmental bargaining in the Council of Ministers.[27] Accordingly, "although the *process* of European Community policymaking is supranational, all this negotiation and coalition-building takes place within the context of agreements between governments...."[28] Consequently, the EC functions as a regime to a large extent, though as Garret has

noted levels of institutionalism are much higher than in most other cooperative regimes.

Within the cooperative regime of the European Community, intergovernmental bargaining has generally followed a predictable pattern. On issues involving trade liberalization in manufacturing sectors, West Germany and Britain have generally pursued agreement on progressive market access. In agriculture, however, while Britain continues to pursue liberalization, Germany has consistently pursued protectionist policies that contradict its otherwise free trade orientation. As Frank Weiss notes, in agriculture "it is generally the most protectionist country in the EC."[29] Along with France, Germany has blocked numerous free trade initiatives that would subject its farmers to external competition.

In fact, until 1991 there was no significant effort to liberalize the Common Agriculture Policy at all, and even then the Mac Sharry reforms did nothing to question the fundamentals of CAP policy, such as price supports and surplus dumping. They did evidence the potentially important role of the EC Commission in molding EC regime directions. They also recognized for the first time that the farmers have some responsibility to absorb some of the costs of overproduction while at the same time noting that direct payments rather than market price supports might be a more efficient way to achieve agricultural stability.[30] However, EC Commission proposals remained difficult to achieve. In June 1992 the EC Council of Ministers for Agriculture finally adopted the essence of the Mac Sharry reforms, including a plan to cut spending on cereals subsidies by almost a third. Up to that time, however, even when the German government favored CAP reform in terms of budgeting and payments, Germany repeatedly blocked liberal initiatives aimed at reducing prices to its farmers.[31] Finally the compromise that was struck set price levels for cereals at what many observers agreed was "at the limit of competitiveness."[32]

Just as the GATT regime never included the expectation that member states would liberalize agriculture to the extent of that enjoyed by manufactured product trade, the EC Common Agriculture Policy has been based upon protectionism and high domestic price supports. To attempt its reform is tantamount to creating an entirely new regime. While institutional decisionmaking structures remain the same, norms and rules of behavior will be vastly different. As Keohane has noted, the creation of new regimes (for example within the EC as well as within the GATT) is much more difficult to achieve than is the maintenance of established regime patterns.[33]

The third regime that must be factored into an analysis of German agricultural trade policy is the cold war containment regime established by the United States to confront the threat of Soviet aggression. As discussed above, West Germany participated in this regime as the key player in the deterrent and defensive strategies devised by NATO against a possible Warsaw Pact attack on Western Europe. Although this regime has nothing directly to

do with trade, for four decades it provided a set of norms, rules and expectations of behavior that proscribed West German policy, especially regarding East Germany.

The division of Germany at the end of World War II became symbolic of the division between East and West in the Cold War. At Potsdam, as well as in the 1949 Basic Law, the possibility of reunification was recognized.[34] Yet cold war politics made this eventuality appear elusive, the subject of nationalistic rhetoric, but realistically little more. As long as the confrontation between the Soviet Union and the United States continued, German reunification seemed impossible, because neither superpower would tolerate a loss of control over its key strategic partner in Europe.

The astonishing events of 1989-90 radically altered the containment regime as it had existed since 1949. The two plus four negotiations that paved the way for German unification brought an end to the assumptions about West Germany's place in Europe and opened speculations about a new role for united Germany.[35] While the normative and rule structures of the GATT and EC regimes remained unchanged, the containment regime was totally revolutionized, and German behavior in the former two regimes was expected to be affected by the changes in the third regime.[36] In fact, some observers have gone so far as to say that significantly new directions are foreseeable. For example, Jagdish Bhagwati, economic policy advisor to the director general of the GATT, Arthur Dunkel, said in an interview in November 1991 that "historically, the Germans have found it very difficult to stand up to the French, but . . . unification of Germany changed this relationship, made the Germans forward-looking and gave them an aura of glory that enabled them to get out in front. . . . now the Germans have more confidence in themselves and Chancellor Helmut Kohl is prepared to play a historic role."[37] Clearly, spill-over from changes in one regime to the other regimes has been expected.

Regarding the German CAP decision, regime theory generally helps to establish the normative and practical contexts for member state interaction and decision making, though it does not adequately explain why change has occurred. As discussed above, the GATT regime provided the forum, if not the actual rules, for the dispute settlement efforts undertaken by the United States and the member states of the European Community, and the GATT Secretariat played an active role in attempting to bring the two parties closer to agreement on agricultural trade liberalization. Similarly the European Community provided the forum as well as the institutional structure for intergovernmental negotiations about CAP reform. The containment regime maintained the division of Germany until 1990, and then collapsed with the end of the cold war. German unification created an entirely new domestic situation for the German government. Although the institutional framework of the Federal Republic was retained, the demographics and socio-economic characteristics of the East challenged western patterns of behavior. The discussion of the domestic situation

below will explain how this has affected Germany's position on the CAP and the Uruguay round.

3.Complex interdependence and international bargaining:

In the discussion above of the validity of hegemony theories I observed that U.S. hegemonic decline, as well as the rise in economic power of West Germany, may offer some explanation of the origins of systemic level pressures on the German government to alter its traditional position on agricultural policy. The GATT trading regime under U.S. leadership established strong interdependent trading relationships across the Atlantic, expanded trade significantly, and contributed to transatlantic discussions and dispute settlement efforts, even if agriculture was never fully embraced. Along with extensive foreign direct investment and other financial transactions, a situation of complex interdependence developed.

Complex interdependence assumes that the extent and complexity of transnational interaction and exchange contributes to cooperation between states as they experience the benefits and costs of interdependence. This interdependence creates "vulnerabilities" and "sensitivities" that allow states to exercise bargaining leverage on other states.[38] Beth and Robert Yarbrough have demonstrted that in the realm of trade, bilateral bargaining can effectively achieve policy goals, including liberalization.[39]

United States activity prior to and during the Uruguay round negotiations is illustrative of such bargaining efforts. The United States actively pursued a retaliatory policy in an attempt to raise the costs to EC member states of maintaining past CAP approaches.[40] This effort to pry the European Community away from its deeply entrenched policy was evidenced in a number of complaints filed with GATT after 1979 and in a number of subsidized sales of agricultural products under the Department of Agriculture's Export Enhancement Program, which were designed to wrest away traditional EC export markets.

Ronald Libby has recently argued that the mercantilistic bargaining approach of the United States did succeed in pressuring the European Community to consider agricultural trade liberalization in the Uruguay round negotiations and to subsequently undertake agricultural reform. However, he qualifies that the effort was a partial success: "Although the program did not succeed in eliminating the 'trade-distorting' practices of EC competitors, it did help restore U.S. dominance of the world grain trade. It also constituted an incentive for the European Community to agree to include export subsidies and even its Common Agricultural Policy on the GATT negotiating agenda-something the community had vowed never to do."[41] He also recognizes that external pressures alone could not achieve reform. Issues within the European Community, such as budgetary contributions and fairness, also came into play. Increasingly, the British and German governments and public came to perceive

that their contributions to agricultural price supports and subsidies were unfairly high in comparison with those of France which was "a major beneficiary."[42]

International bargaining did apparently apply pressure on EC member states to consider reform and to include agriculture in the Uruguay round, but it alone did not succeed in leveraging the EC away from the core agricultural support and protectionist program. Despite differences concerning budgets, Germany, as well as France, remained committed to the goals of the CAP.

During 1991-92, however, noticeable changes were evident in the EC's stance toward agricultural reform. Under the leadership of Ray Mac Sharry, the EC commissioner responsible for agriculture, a new effort to reconsider the fundamental tenets of the CAP was launched. In June 1991 he announced a new approach to agricultural support that included production limits on a range of products (limits had existed on milk for some time) and the notion of direct payments to farmers.[43] This reform effort limited future rises in subsidy levels, but did not reduce current levels, a severe shortcoming as far as U.S. negotiators were concerned. Moreover, it did not repudiate the practice of surplus dumping, a key concern of U.S. agricultural interests. Consequently, the United States continued to apply pressure to force the EC to further reform its approach to agriculture.

In addition, in March 1992 a GATT panel report on EC oilseed subsidies was announced which confirmed the U.S. claim that the practice was discriminatory and trade distorting, and that an "overhaul" of the program after a similar 1989 GATT panel ruling "did not go far enough."[44] This buttressed the U.S. position in the Uruguay round negotiations and added further pressure against EC policies. By the summer of 1992 the United States was threatening retaliation against the EC if it did not reach an agreement on the oilseeds issue and larger CAP reform. In June "the U.S. Trade Representative's Office released a list of EC products, with a total import value of $2 billion, and said the U.S. would choose $1 billion of them for 'prohibitive' levies unless the fight were settled."[45] While the oilseed dispute was not directly related to the Uruguay round, the United States was utilizing it as a lever in the larger negotiations.

By fall, in the aftermath of crisis in the exchange rate mechanism of the European Community and the narrowness of the French vote ratifying the Maastricht Treaty, pressure was mounting for the successful settlement of the trans-Atlantic dispute. The Uruguay round negotiations were stalemated yet again, and the prospects of a trade war heightened as the United States set a deadline for agreement. The U.S. Trade Representative threatened that if it expired without an arrangement acceptable to the United States, the retaliatory tariffs listed in June would go into effect.[46]

Observers generally agreed that Britain and Germany were in agreement that a compromise on CAP oilseed policy was necessary and that a larger reform of CAP should be put forward before the U.S. deadline. France, however, was unequivocally resolute in

its objection to "any substantial cuts in agricultural subsidies."[47]

At the EC-U.S level, negotiations proceeded at a rapid pace Reportedly within reach of a settlement at a meeting in Chicago during the first week of November Ray Mac Sharry was interrupted by a call from Jacques Delors, influential President of the EC Commission and masterful engineer of the 1992 single market plan for Europe. Delors intervened to say that "he, the French government and one other EC member state opposed Mr. Mac Sharry's planned offer." In reaction Mac Sharry resigned as the chief negotiator of the farm deal.[48] This episode triggered a spate of intra-EC bickering and then a renewed attempt to reach a compromise, with Germany taking a more prominent role in leading the effort, and Mac Sharry agreeing to resume his position in the trans-Atlantic negotiations.[49] Clearly, the French found themselves "odd man out," as Germany, the largest oilseed producer in the European Community, demonstrated its willingness to accept a modification of EC subsidy policy on oil seeds as well as a larger farm reform package in order to avert deeper trade problems with the United States that would further delay the Uruguay round.[50]

The package itself pledged the EC to reduce subsidized farm exports by 21 percent over the next six years, and "that oilseed production areas would be limited to 5.128 million hectares." In addition subsidization of cereals would be reduced by 29 percent over the next three years, and there would be a plan for a 15 percent yearly set aside of production areas.[51] Immediately the French government announced its opposition to the deal and despite a number of meetings between Germany and France, to the present no mutually acceptable compromise has been reached.

This set of events demonstrated that intergovernmental disagreements-particularly between France and the other major EC member states-overshadowed EC institutional solidarity on CAP reform and trade liberalization. Despite EC Commission facilitation of the reform effort, the essence of the trans-Atlantic negotiations remained characterized by intergovernmental bargaining, with Delors doffing his Commission hat in favor of his French beret, and Germany joining Britain in support of a settlement with the United States. Clearly, intergovernmental bargaining, including the prospects of U.S. retaliation contributed to the willingness of Germany to take the lead in confronting France and keeping CAP reform and trans-Atlantic negotiations on track. However, this alone was not enough to explain the *change* in the Kohl government's behavior. To round out our explanation of this situation, we must finally turn to domestic institutions and politics.

4. Domestic institutions, coalitions and politics:

A number of theorists have focused attention at the domestic level in an effort to explain why nations behave the way they do internationally. From Kenneth Waltz' depiction of the "second

image" to Peter Katzenstein's work on comparative industrial policies, students of international relations have become cognizant of the importance of examining domestic as well as international factors of explanation.[52] In the case example being explored, an examination of domestic factors is crucial. An understanding of Germany's behavior depends to a large extent on an understanding of the domestic institutional structures and politics surrounding agricultural policy.

At the opening of the Uruguay round of trade negotiations, Frank Weiss, an analyst of the German policy position, predicted that German agricultural policy was ripe for change. He listed the following reasons: "The farm vote is needed to stay in power. The other EC countries will not accept the demands for higher prices tabled by the German Ministry of Agriculture. The German federal budget cannot bear the cost of supporting farmers by continuing to raise output prices in the present way. The farm lobby, propounder of past policies, is under attack by the small farmers."[53] What Weiss could not foresee was German unification, which did not alter the veracity of his conclusions but served to make them all the more appropriate. To see why this is so an examination of domestic electoral institutions and politics, as well as the impact of unification, is necessary.

In our discussion of hegemony and regimes we noted that West German political and economic structures had aimed at ensuring stability. This included an electoral system that allowed proportional representation, but provided for a five percent threshold to prevent extremist parties from splintering the Bundestag and obstructing the goals of mainstream politics. Students of West Germany are well acquainted with the pattern of representation in the Bundestag since 1949. Two major parties have competed for governance, the Christian Democratic Union (the party now in power) and the Social Democratic Party (the opposition party at the present time.) In addition, two other parties have consistently received over five percent of the vote and therefore sit in parliament as well--the Free Democratic Party, often termed the liberal party, and the Christian Social Union, to this point in time a permanent coalition partner with the CDU. While the FDP purposely shifts its allegiance between the two mainstream parties in order leverage cabinet positions and gain influence in a coalition government, the CSU has always aligned itself with the CDU.

The CSU is a Bavarian based party, so much so that the votes it receives to surpass the five percent threshold have been gained almost exclusively in that region. The CDU has agreed not to campaign in Bavaria and in turn the CSU has confined itself to Bavaria.[54] This has meant that the CSU has concentrated control of the Bavarian land government, but has virtually no influence in electoral politics elsewhere. As Weiss has noted, the CSU depends heavily on farm support, and this has had the double effect of concentrating farmer influence in this region and forcing the CDU to place farm issues high on the larger party's political agenda. As he puts it, "not only do the farmers have a

lobby, they also have a client party and local state government to argue their case."[55] This, he argues, is an important reason why "the German position in agricultural policymaking in Brussels is the opposite of that for industry," that is, protectionist rather than free trade oriented.[56]

Paterson and Southern have argued that the Common Agricultural Policy has been extremely important for the CSU since it has meant that "the costs of supporting the very uneconomic Bavarian agricultural sector were not borne by the state finances of Bavaria....The maintenance of the CAP and of high agricultural prices has therefore been a key CSU policy."[57] Clearly, the CSU has taken its position on agriculture to the CDU, and given rather marginal electoral success for the CDU in past elections, the CDU has treated the issue with favor, despite long-standing acrimony and rivalry which existed between Helmut Kohl, Chancellor and head of the CDU, and Franz Joseph Strauss, leader of the CSU until his death in 1988.[58]

With unification, the future of the CSU has become tenuous. Because its support is regionally concentrated the CSU stood to lose in all-German elections that included former East Germany. As Wallach and Francisco note, "[the CSU] has consistently earned more than 9 percent of the vote in the West, which is about 6 percent of the vote in a united Germany. Realizing the danger of this percentage before the March DDR elections, party officials sought to hinder the danger of being close to the 5 percent hurdle by founding an Eastern wing, the German Social Union. However, the 6.3 percent the German Social Union gained in the March DDR election fell to 1 percent in December. *So the Christian Social Union must face the future possibility of falling below the 5 percent mark.*"[59]

At the same time that the CSU suffered diminishing proportional influence, the CDU maintained its overall proportion of support, indicating a relatively stable position in a united Germany and a particularly strong showing in East Germany.[60] Electoral shifts against the CSU, as well as altered regime circumstances noted above, may well have emboldened the CDU to reconsider its long-standing agricultural policy. This is especially plausible given the very different orientation of East German agricultural interests.

According to an EC Commission study of East German agriculture, "5.85 million hectares or 95 % of total agricultural lands is operated by only 4,751 farms (465 directly state owned and 3,855 cooperatives)."[61] This means that the farms in the East are significantly larger than in the West, and although they do not currently have the equipment to operate such large units efficiently (there is a high labor to land ratio in the East), the long term potential is for more competitive agricultural production. While farms in the West have traditionally been smaller, especially in Bavaria, the trend has been toward larger, more economically competitive units. Thus, the addition of larger East German farms could move Germany further away from its traditional stance favoring high levels of protection for small,

inefficient farms to a more liberal position. As Lippert et.al. have noted, "the integration of the former GDR, with its large-scale units, into the EC and CAP drew Britain and Germany closer together, as Britain hoped for a softening of the German position on CAP reforms. Although in West Germany the view was that units in the East were too large, West German agriculture, with its small farms, remains uncompetitive within the EC relative to average incomes."[62]

These structural changes in agriculture as well as in electoral demographics which resulted from unification have drastically altered the domestic political environment in the agricultural sector. The diminishing importance of the CSU, combined with long-standing clashes between it and the ruling CDU, plus the shifting orientation of agricultural interests, have combined to release the Kohl government from its traditional intransigence on farm reform. Weiss's predictions of several years ago are particularly prophetic in light of these changes. He is correct that the farm vote is needed for the CDU to stay in power; however, he could not have foreseen that unification would shift the locus of agricultural influence away from Bavaria. Thus, appeals to the farm lobbies will increasingly focus on the larger farms, continuing a trend that had already divided the farm lobby. Ongoing pressure from fellow EC member states to achieve farm reform, as well as pressure from the United States and the GATT, has contributed to a reconsideration of the German position. Finally, Weiss's prediction about the unacceptable pressure on the federal budget of farm support takes on new dimensions in the wake of the costs of unification. The budgetary crisis and high interest rates which so strained the European Monetary System during 1992 added even stronger pressure on the Kohl government to cut agricultural spending.

Conclusion:

This case study demonstrates that changes in the international structure resulting from the thaw in the cold war and changes in the U.S. containment regime in turn opened the way for changes in Germany's domestic political structure, and this caused a shift in policy preferences. It supports Putnam's view that explanations of foreign policy initiatives must take into account that both domestic and international factors influence decision makers. Systemic level theories such as hegemonic stability theory, regime theory, and theories of international bargaining are important in helping to frame the international context for national actions. At the systemic level, one can focus on power relations, interdependence, and regime expectations, all of which become part of the calculation of national interest and of the opportunity costs faced by a national government in choosing one set of actions over another. The fact that Germany has faced pressure from the United States, the GATT negotiation process and from other EC member states such as Britain to reconsider its position on agricultural reform

established the systemic context. The evolution in economic power positions and significant regime change have altered the international environment in which Germany operates, opening opportunities for new directions in international policy.

However, this context, while crucial to an understanding of the constraints and opportunities available to German interests internationally, does not fully explain why the initiative in November was taken. To understand this, one must also examine the recent changes that have occurred domestically, because these changes have resulted in the removal of constraints which previously hindered such an action. Unification and its attendant impact on the domestic economic situation, electoral patterns, and farm lobby characteristics have all contributed to a very different set of domestic circumstances. These circumstances have allowed the Kohl government to pursue a more assertive leadership role in reforming agriculture without fearing adverse electoral consequences.

Thus, this case illustrates that to deepen our understanding of new policy initiatives which break with old allies and signal new directions in international leadership, it is necessary to consider a range of systemic as well as domestic level explanations. To focus on any one theory is to limit our knowledge. However, a more vertically oriented approach takes us beyond traditional methodological boundaries and opens the way for more comprehensive explanations. At the same time the use of single integrating concepts such as structural change may assist us in exploring the interaction of domestic and international factors without forfeiting parsimony altogether.

THE MORAL IDENTITY OF THE CITY MANAGER IN THE INFORMATION AGE

by

Fred W. Rhynhart, J.D., Ph.D.
Associate Professor
Department of Political Science
Northern Kentucky University

Identity of the City Manager
Introduction

I began to think about this paper quite a while ago. As a county manager (or a close approximation thereto) I had approached my job as a change agent. We tried zero based budgeting, developed a computerized road information system, and carried out a survey of voters on a number of topics, including public apprehension about a nuclear power plant then in construction.For my troubles or the predicaments that these changes thrust me into I was soon returned to the academy.Since then I have considered the dilemmas of the administrator that arrives with his own agenda of change.

The Master of Public Administration at Northern Kentucky University gave me the opportunity to teach several courses including administrative theory, public policy and ethics for administrators.My earlier practice was then cast in a different light.

Parallel to this development was the chance of my living in a council-manager city.I was active in the community: first, as an resource person for neighborhood groups; then, as an a neighborhood leader; and finally as a candidate for city council. I am currently serving in my fourth year as a legislator in a council-manager system. Just now I am in the middle of a campaign for a third term.

This preparation combines theory and practice.It has brought me to the concerns in this paper.The principle QUESTION is how can a manager who sees the need for change carry out his job in an ethical manner consistent with democratic theory. For it is clear that the information age in our cities require a many great many changes and that the old role of the instrumentally efficient city manager does not fit the contemporary age. Several writers and managers frustrated with the limitation of a more passive role have imported the role of entrepreneur from the private economy into council manager system.It might be noted that the "entrepreneurial management" has been suggested as a new paradigm for public administration. This paper will not evaluate all the ideas suggested by Drucker(Innovation and Entrepreneurship,1985) and his progeny Osborne and Gaebler(Reinventing Government,1992) but will limit itself to the

concept as city manager as entrepreneur.

The approach of the paper will to study the historical evolution of the role of the manager in the council-manager system and place the current debate over the ethical role of the city manager in the context of that evolution.The entrepreneurial school will then will evaluated in light of the wave of a concern for ethics in public administration.

I Traditional Role of the Manager

A. The Origins of the City Manager System

> Democracy is my prime objective and not money saving and greater efficiency. Richard Childs
>
> They represent in their professional capacity a determination to keep the technical services of local government "out of politics"....Louis Brownlow

The Progressive movement gave us two great and long lasting political reforms of the American political system, the primary election and the city manager system.In creating the city manager system the Progressive movement sought the goals noted in the quotes above. In their day and in their way of thinking the goals of centralized administrative authority and democratic participation were reconcilable in the city manager system.(Stillman,1974,p.9). It is the goal of this to reconcile these goals in the ever changing information age.

From the Progressive point of view a neutral manager would impartially implement the decisions of the city council. The council being elected at large on a nonpartisan ballot would oust the corrupt influences of the ward based political machine.What Hofstader described as the "public regarding" citizenry could make electoral decisions for the good of the entire city rather than upon rather self interest in the shape of the ward based political party that had corrupted the political process.(Ibid).The analogy of the efficient business corporation was extended to the municipal corporation.The citizens became the stockholders.The council or board of directors elected by the entire body of citizens or shareholders then hired a professional manager or CEO to run the city government or firm on

the easily measurable criteria of efficiency for the taxpayer or profits for the shareholder. To the urban progressive mind urban reform,democracy, and efficient administration could all be had simultaneously in the city manager system. Whether this simple resolution of the inherent tension between centralized administrative authority,democratic participation, and urban reform can be achieved in the global economy that has shaped our dependent cities in the information age will addressed below.

B. Implementation of the System

As the city manager reform gained momentum during the Progressive era and just after World War I it was natural that civil engineers made up a significant portion of the novel profession of city managers.Cincinnati, typical of many city manager systems, had major projects of infrastructure development; street and sewer construction abounded as the street car city moved into the automobile metropolis. It was natural that the engineering profession most expert in these infrastructure problems would become the modal city manager in Cincinnati and elsewhere. In 1920s and into the 1930s the vast majority of those managers with a college degree had studied engineering(Stillman,p.39). The complicated yet narrow focus of infrastructure problems of the emerging automobile city provided a real compliment to the Progressive hope that "the City Manager is the manager of all the people...he should serve without discrimination"(Stillman,pp.38-39).As this quote from the 1924 Code of Ethics suggest the emerging profession illustrated the Progressive values of impartial,efficient administration and honest democracy.The attainment of these value was aided by this want of technical professionals in the infrastructure era. This need supplied by civil engineers provided a harmonious integration of impartial administration with a democratic elected council and furnished a nucleus of professionals as the core for the development of a new profession. This novel profession with engineers as its nucleus called itself into being in 1914 as the City Managers' Association and in 1924 added the first Code of Ethics analogous to that in the engineering field. That code called for a city manager whose "personal conduct...should be exemplary".(Stillwell,pp.4;38). In sum the calling of civil engineers to begin the city manager profession

provided a ready made model of instrumental efficiency that helped reduce the tension between the Progressive values of democracy and centralized administrative power.

C. The Scientific City Manager

As the city manager profession evolved out of a core of engineers, scientific management arose to prominence.Born with the research of Frederick Taylor on how to make existing production more efficient, the scientific management movement was brought into the public sector. The unquestioned confidence that the public placed in science was carried into municipal government.The beneficiary of this reliance upon science as the guiding force reinforced key concepts of the Progressive reformers. The city manager was the neutral expert.Administration as a science could be separated from the politics of the city council.(Nalbandian,1991,p.14).

The role of the city manager was an instrumental one. He was the instrument of the city council that set policy.The instrumental values that the manager was to follow were efficiency and economy.The city manager was a technician, much like the civil engineer that most early managers either were by experience or by training. The ideas of scientific management reinforced this moral identity as a technician. This moral identity could focus on means/ends morality,i.e., to do the most competent job possible to find the most efficient means to the ends chosen by the governing authority.Logical positivism provided the philosophical foundation for this simple role to be played with its correspondingly innocent moral identity.(Stillman,p.11). Several universities and foundation played an important in this evolution of the city manager profession in the late 1920s and into the 1930s. The International City Managers' Association(hereinafter ICMA) worked closely with the University of Chicago; as they undertook a joint effort to apply the scientific management philosophy to city management. Two authoritative works that expounded this outlook were Leonard White's The City Manager(1927) and Clarence Ridely and Orin Nolting's The City Manager Profession(1934).(Stillman,p.44).

The 1938 Code of Ethics exhibited the pull of the scientific management conviction. The 1938 Code noted that:

> The city manager is in no sense a political leader.In order that policy may be intelligent and effective, he provides the council with information and advice but he encourages decisions on policy by the council instead of passive acceptance of his recommendations. The city manager realizes that it is the council, the elected representatives of the people, which is entitled to the credit for the fulfillment of municipal policies and leaves to the council the defense of policies the defense of policies which may be criticized. The city manager keeps the community informed on municipal affairs but keeps himself in the background by emphasizing the importance of the facts.(in Stillman,p.125).

The manager was "in no sense a political leader". Information and advice was to be based on facts and the council was to defend its own decisions. Values could be separated from facts and the manager was to base his objective decisions upon the facts. The self effacing technician was to keep from value decisions,controversy, and politics. From the hindsight of the revisionist thinking of our age this view seems overly simplistic, however, it did provide an unadorned moral role for the manager.

II. Adaptation to a New World:A New Paradigm for a New World

What is efficiency?

> Belsen and Dachau were "efficient" by one scale of values. And in any case, why is efficiency the ultimate test? According to what and whose scale of values, is efficiency placed on the highest pedestal? Is not the worship of efficiency itself a particular expression of a special value judgement?
>
> Robert Dahl,1947.

Robert Dahl expressed the realization of a generation in his 1947 article.The world war had discredited efficiency as the central value of public administration.For as Dahl noted who were more efficient than the Nazis.The trains that Eichmann organized so efficiently ran according to the order of legally constituted authority.The administrative efficiency of totalitarian regimes so utterly horrified Americans such that not merely the standing of certain ideas changed but the perception of a generation was altered.Efficiency could no longer stand alone to justify the simplicity of the city manager system and the modest role and its corresponding

amoral identity of the of the city manager as the scientific management advocates had hoped. As Dahl depicted it, democracy and efficiency might well be rivals. Why speak of efficiency as the "single ultimate test of value in administration"? If a conflict between efficiency and democracy arose Dahl thought democracy must prevail.He asked rhetorically whether or not democracy "ought it to prevail because it has, in some sense, greater value"?(Dahl,1947). Suddenly the interconnected concepts that justified the city manager system were broken apart.Efficiency could no longer stand unquestioned.The technicians that had brought efficiency forth as they key value during the infrastructure construction period of our cities were suddenly out of date as the American system confronted the rigors and horrors of world leadership. Efficiency now must be balanced with other concerns for the American soldiers who witnessed Dachau and Hiroshima and would lead America for a generation.

A generation of social scientists lead in part by Robert Dahl would turn to research,case studies, and the behavioral movement.Although they would thoroughly recast the role of the city manager in a positive fashion, they first thoroughly debunked the myths of the previous generation's ideology as they now saw it.(Stillman,p.55;Svara,"Dichotomy",p.53).

A.Incompatible Research

While the dark storm clouds of the great war gathered in Europe and Asia some mundane research was being carried in American cities in the late 1930s. These case studies were turning up evidence incompatible with the traditional view of the city manager. The Social Science Research Council studies of 32 cities concluded it was "generally impossible for the city managers to escape being a leader in matters of policy, for it is an essential part of his administrative job to make recommendations". The recapitulation of the research cases noted that the managers had made "contributions in the technique of administration but they have made an even greater contributions as leaders of municipal policy".(Stone,Price,and Stone,City Manager Government in the United States(Chicago,Public Administration Clearinghouse House 1940,p.243),cited in Stillman,p.58).The postwar perception was stated

well by a president of the ICMA when he noted the city manager was more than a mere administrator but a formulator of policy.(Stillman,p.58). The budget came to seen as part of the policy process,i.e., something beyond mere technical processes.(Appleby,APSR 42:281 in Stillman,p.55). The policy process as a focus of study and conceptualization was under way. This development was critical in the revisionist view of the city manager that was developing; for the policy process would, when broken into its component parts, deny the dichotomy between administration and politics. Values and political calculations would enter the manager's domain, particularly in: 1) defining a problem, 2) determining a problem's political viability in deciding to place it on the agenda, 3) selecting policy alternatives and modes of evaluating them, and 4) monitoring and evaluating them.(Patton and Sawacki,1986,p.37).

Bosworth went so far as to describe the city manager a "local politician"(Bosworth,PAR,1958 in Stillman,p.61). Although this sardonic dose of realism was a bit too much for some, it certainly reflected the post war rejection of the traditional view of the city manager as the instrumental technician. The 1952 revision of the ICMA Code of Ethics fit this postwar understanding. The city manager now had a"constructive,creative and practical attitude toward urban problems and a deep sense of his own social responsibility as a trusted public servant".(Stillman,p.125). This new section head the nail on the head- creativity was necessary to deal with urban problems.It was now conceded that the manager's key position in the policy process made him a the leading player on the urban stage of politics.

Freed from the small area allowed by the tether of the technician,the manager's role now was accorded a great deal more freedom as efficiency had become only one value among many. The new role was vague and ill defined in giving a general yet not clear direction, such as maintaining "a constructive" and "practical" attitude. And the "social responsibility as a trusted public servant" pointed the nature of a fiduciary relationship but did not define the nature of this trust relationship.Freed from the narrow pre war role through the demise of efficiency as the singular value and through the acceptance of the reality of political involvement in policy,the

manager was left mostly to his devices.

B.Changing Social Values

The times they are a'changing.Bob Dylan.

Violence is as American as cherry pie. H. Rap Brown.

Just as the city manager profession and its supporting academic community broke loose from the secure moorings of the scientific management notion, thereby reopening value redefinition and role redefinition in a time of flux, the decade with the highest degree of social turmoil and cultural change in this century burst on the country. The freeing of many African colonies fanned the fires smoldering for years in the Afro-American community under Jim Crow. A youthful President sparked the idealism of a generation of white Americans by suggesting international public service in a Peace Corps.Suddenly these strands of idealism and dissent came together in the civics right movement in the early 1960s. The quest for racial equality became especially important for our cities as a massive internal migration by Afro-Americans to our cities occurred due to the mechanization of the share-croppers' tenancy in the south.

This crusade for racial equality had numerous victories in the form of federal law affecting: 1)traveling accommodations, 2)eating facilities,3)voter registration, and 4)school desegregation.These monumental transformations revolutionized southern life and politics; yet brought little change to the life of the masses of Afro-Americans that had come to live in the inner city.There rising expectations of a better life were not to be had in an economy where entry into a union or a successful education were key.Then on August 11 1965 rioting broke out in Watts. A wave of riots followed throwing great apprehension unto the urban social system processing the American dream.

Given the backdrop of the protracted,losing war in Vietnam, the

American social fabric seemingly fell apart in the late 1960s.The counter culture with its focus on rural,communal living and its rapture with drugs was memorialized by troubadour rock and roll bands.Woodstock and Altemont seemed for a time to hold more promise for youth than the suburban dream that their parents had realized.

It was in this seeming tide of social chaos that Redford proposed in 1969 that participation,equality, and individualism be added to the value of efficiency as key values for public administration.(Redford in Nalbandian,1991,p. 89). H. George Frederickson, two years later, argued that pluralistic government discriminates in favor of special interests capable of political articulation.The results of this skewed political system were cities with high unemployment and poverty in an age of extravagant opulence. Frederickson found this condition to be"morally reprehensible and if left unchanged constituted a fundamental, if long range, threat to the viability of this or any other system". Hardship amid abundance cultivates radical action which in turn invites subjugation. Given this American situation Frederickson called for a new professional orientation:

> A Public administration which fails to work for changes which try to address the deprivation of minorities will likely be eventually used to repress those minorities.(Frederickson,1971, in Shafritz and Hyde,1992,p.369).

Frederickson thought that administrators needed to be committed to good management and social equity.(Ibid). As second generation behavioralists the new public administrators were "more public and more prescriptive".(Ibid). The new public administrator would be trained as a "change agent" and an advocate for "informal,decentralized,integrative processes"(Ibid).Rejecting the idea that administrators are value neutral, Frederickson posed the problem of values conflict and suggested a "blending" of values associated with traditional public administration with the new value of social equity.(Frederickson,A & S, 1976).

C. The Rise of Neighborhood Organizations

If these changes in the perception of the city manager's role and in the key values that once secured the moral identity of the manager were not enough,the political system of our cities became transfigured. Neighborhood organizations developed from the late 1960s onward. A new pluralism representing centrifugal forces similar to the ward system arose. Only the ascent of these decentralized forces coincided with the further decline of the political party.The These neighborhood associations represented a focus narrower than the city wide locus the Progressives had tried to engender. Though narrower in focus much of the neighborhood movement had a "public regarding" ethos similar to that of the urban Progressives. This geographic pluralism "led to more visible roles for managers in the mission and policy functions of governments.(Nalbandian,1991,p.63). A 1980 League of Cities Survey found neighborhood groups the most influential force in council-manager cities.(Ibid,p.20). Neighborhood budgets and block associations moved decentralized groups into administration and the city manager further into the politics of negotiation and barter.(Ibid,p.63;Cooper,1991,p.142).

Sy Murray,city manager of both Cincinnati and San Diego, in his successful career sums up this new development well:

> I have been accused of being a politician because I get out in the community. And I do make speeches, and I do talk to the citizens, and I do encourage neighborhood groups, and I do listen to them, and I do make the city bureaucracies change because a neighborhood group says that they want something.I think that I have been right all these years and that more is going to be demanded from managers who haven't been doing that. -Sylvester Murray(1987,in Nalbandian,pp79-80).

D. Minority Representation

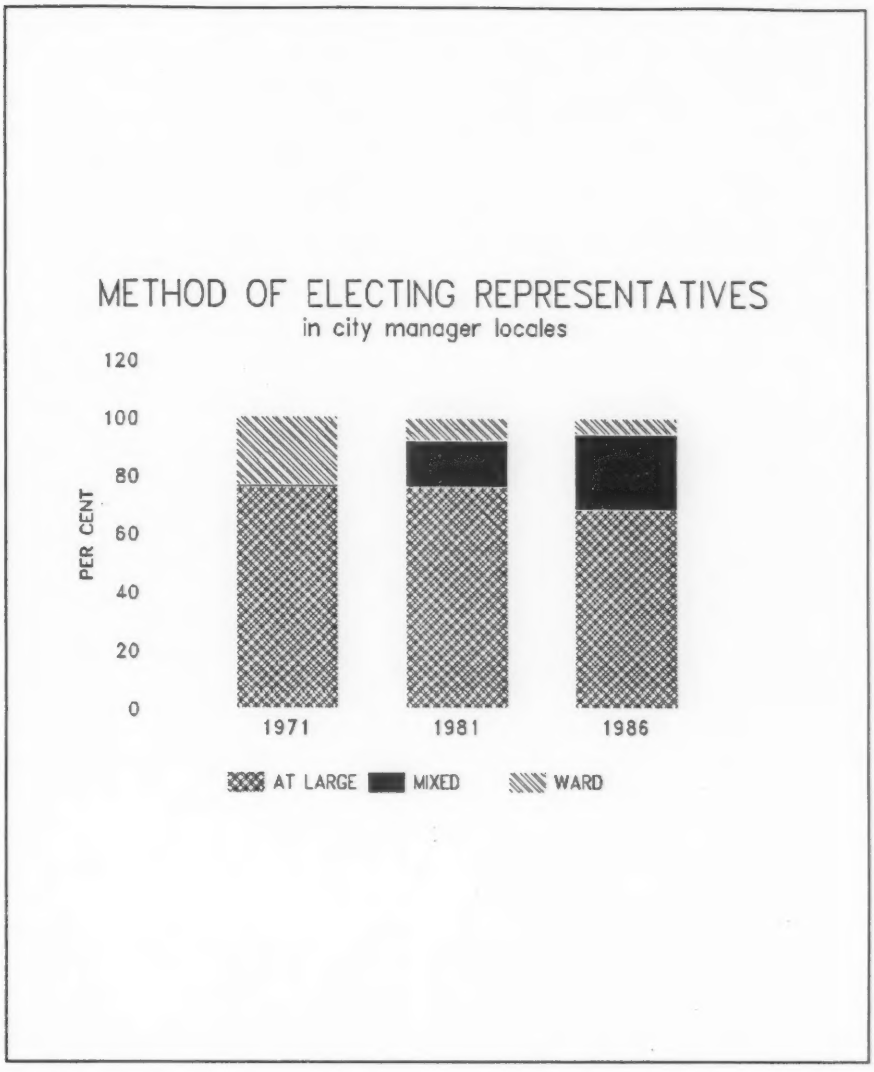
Just as the neighborhood movement grew out of the 1960s so

did a feeling in minority communities that the city manager at large system hindered the election of minority representatives.(Nalbandian,p.32). Although a number of studies had over the years demonstrated the costliness of city-wide campaigns and their tenancy to recruit candidates from strata above the working class, the criticism of the at large system gained momentum in the 1960s as Afro- American numbers in the bigger cities grew.As did the perception among federal judges grew that adjustments had to be made for the sins of past discrimination. In 1986 the highest court in the land ruled in Thornburg v. Gingles that the at large system produced discriminatory patterns of representation. In 1990 a lower federal court ordered Dallas to come up a more satisfactory plan of representation.(Ibid,p.40).

This alteration in the city manager plan by the federal courts affects the role of the city manager.First, in the short run it puts the city manager in the middle a series of critical negotiations effecting the nature of the city's political system.Second,it requires an adroit balancing of interests between the Afro-American community and a typically white dominated council.Third, as mixed systems of representation grow at the expense of the at large system, the city manager is subjected to institutionalized interests other than the neighborhood associations that are less than city wide in scope.In effect,the city manager's job role in those cities becomes more demanding politically.

As we can see in the chart that follows the method of picking council members in the council-manager changed significantly during the 1970s to the late 1980s.Whereas nearly 80% of the locales chose council members at large during the Nixon years only 70% did by the end of the Reagan era.Most of the cities changing moved to a mixed system, with some council-persons elected at large and some elected in districts. The net impact is that 10% more managers were working in hybrid systems rather than the at large system designed to insulate managers from the brokering of narrower interests that the new federal case fosters.(Nalbandian,p.41).

Other factors beyond the rise of neighborhood associations and the judicial encouragement of minority representation through mixed



systems of representation have worked to change the role expectations of city managers. Such problems as revenue shortfalls, the importance of intergovernmental relations and its attendant lobbying,the rise of television including cable television, along with the demographic shifts noted above have disturbed the equilibrium of the council manager system. These changes have increased the importance of the " negotiating, brokerage, and consensus-building

skills of today's managers more than early predecessors".(Nalbandian,p.53).As

Brown noted the practical problem becomes how to carry this more politicized role without threatening council.(Ibid,p.77). Although it is clear that city managers are reacting to real forces that have required the application of more political deftness, the issue arises as how much of an increased attention to politics is a matter of choice.(Ibid,p.55).It is a more complicated issue of how these changed realities should be integrated into the role and moral identity of the city manager.

E.Economic Development

Another critical factor in the changing role of the city manager is economic development. For many manager cities the current post industrial era is one of strain. As many industries have become international the freedom of movement of capital no longer is constrained by local markets, defined by a slow transportation system and a confined communications network.The global village has made the market for capital investment truly worldwide.As a result of the multilocational corporation our cities have become dependent on outside capital and investment decisions for creating new jobs, a necessity in a dynamic economy.There is widespread competition for this world capital by localities. (Kantor,The Dependent City,1988).This competition has placed the city manager in the middle of the development and implementation of strategies in this competition for capital. Managers spend a good deal of time in strategy sessions in regard to the external community.(Tipton,in Frederickson,1989,p.177). Tax incentives,state and local financial assistance,tax free bonds,and the role of enterprise zones are several of variables to be worked in developing an overall economic development strategy as well a tactical program for individual companies.

Economic development is in may cases the core problem confronting city managers.This provides a stark contrast to the rational infrastructure implementation that the earliest city manager faced.Toady's manager faces a more strategic task that requires the skills of brokering,negotiating, as well as mobilization of the business community, and diplomacy.

F. The Information Age,Technology, and Entrepreneurship

Perhaps a change more important than the development of the dependent city is the onset of the computer age.The information age struck city government in the 1970s. Technological improvement were visualized as the way to increase productivity.(Bingham and Fehlbinger,in Frederickson,1989,p.244). Difficulties in attracting multinational corporate capital and the rising costs of public services among other factors put stress on managers to increase productivity.One ICMA activity of the 1970s was the Local Government Management Innovation Transfer Project funded by the National Science Foundation(NSF). (Ibid,p.245).

As the 1970s gave way to the 1980s interest in technology gave way an interest in "innovative behavior". The ICMA Guide to Management Improvement projects in Local Governments, a quarterly publication listing local programs that improved service levels or cut costs typified this change.(Ibid,p. 247). The understanding that it was not the mere application of technology more effective but a reformation of management or "public entrepreneurship". In the 1980s these were "opportunity-focused",pro-active managers instituted change at some risk to their organizations and their careers.(Ibid). Doig and Hargrove thought such experimentation needed public support either "spontaneous" in its origin or "'created' by the entrepreneur when public opinion is vague". (Ibid,p.248).

Certainly it can not be disputed that the role of the city manager has become more involved with policy and more political.The moral content of the role has moved from technical implementator akin to an civil engineer to the suggested role of an entrepreneur akin to a risk taking businessman.This raises the question of the ethical propriety of the latter role.

III.ENTREPRENEUR,ENTREPRENEUSE

> The entrepreneur shifts resources out an area lower and into an area of higher productivity and greater yield. J.B. Say,1800.

> We live in an era of breathtaking change.We live in a global marketplace,which puts enormous competitive pressure on our economic institutions.We live in an information society, in which people get access to information almost as fast as their leaders do. We live in a knowledge-based economy, in which educated workers brindle at commands and demand autonomy. We live in an age of niche markets, in which customers have been accustomed to high and expensive choices. Osborne and Gaebler,1992.

> We need to encourage habits of flexibility, of continuous learning, and of acceptance of change as normal and as opportunity--for institutions as well as for individuals. Peter Drucker,1985.

The information age with its intense global competition for consumers dollar have brought dramatic changes to both markets and business enterprises.This vigorous reassertion of the key role of the markets and of creative and bold leadership was necessary for success in the near chaos of computer spinoff and world market driven changes.These dramatic events in the private arena has lead several and many managers to claim the mantel of entrepreneur for public managers.Not only has there been a spate of literature arguing the benefits of such a role assignment (Drucker,1985;Doig and Hargrove,1986;Osborne and Gaebler,1992) but many local managers have laid claim to the same role.

We need to define this role and examine its moral identity in order to evaluate its usefulness for city managers.An entrepreneur is an organizer of an economic venture,one who owns,manages, and assumes the risk of a business.When we compare this idea to Say's idea noted above(Drucker,1985) we note the key element of risk taking that is necessary to reorganize activity to a new level of resourcefulness. An entrepreneur to be sure is a change agent, as I

noted I was in my county experience; but, it is risk taking at a particular juncture in history such that the expense and hazards of a new organization of resources is yet the most efficient economic move that can be made. Peter Drucker has argued persuasively that this is in essence a natural aspect of economic activity, at least in the free entrepreprise mold. He holds that entrepreneurship can actually be an applied science.He notes the seven conditions that precede this type of qualitative innovation.These can be studied as analytical base for decision-making.Field knowledge of consumers and perceptive insight are also needed.Drucker presents in Innovation and Entrepreneurship(1985) a convincing case that innovation can be systematized. Large corporations such as Proctor and Gamble have succeeded decade after in a program of systemized innovation.

Drucker thinks it is essential for government to innovate in a fashion that would parallel that occurring in the private sector. Government should look "look upon social,technological,economic,and demographic shifts as opportunities in a period of rapid change in all these areas".(Drucker,1985).Following Drucker's lead , Osborne and Gaebler in Reinventing Government(1992) assert "entrepreneurial government" is coming to America . Using a wide range of examples Osborne and Gaebler make the case that use of market type reforms have improved government functioning.

A. A New Paradigm?

Buddy, can you 'pare a dime? Anonymous

Reinventing Government,a thought provoking book, does not utilize a consistent methodology to compare market reform and non-reform cities.Rather they are the harbingers of a new paradigm for public administration. This inventive variety of governmental organization they affirm appears as " lean, decentralized, and innovative". These entrepreneurial governments use "competition,customer choice, and other non-bureaucratic mechanisms" in an enterprising and useful manner.(Osborne and Gaebler,1992,p.2). This "entrepreneurial government" is described as follows:

It is willing to abandon old programs and

> methods. It is innovative and imaginative and creative.It takes risks. It turns city functions into money makers rather than budget busters.It eschews traditional alternatives that offer only life-support systems.It world with the private sector.It employs solid business sense. It privatizes. It creates enterprises and revenue generating operations.It is market oriented.It focuses on performance measurement. It rewards merit. It says "Lets make this work" and unafraid to dream the great dream.
>
> Osborne and Gaebler,p.18.

Osborne and Gaebler offer the entrepreneur as someone working out of a market based paradigm. This paradigm provides the role that will allow managers free ranging authority to cope with the changes governments need to make in the information age.This paradigm also provides a set of reform ideas such as competitive contracting out to several private firms based on geographical subdivisions.Where Drucker choose not to tread Osborne and Gaebler have,they in essence are providing a new paradigm for governmental reform and public administration wherein the city manager would be an entrepreneur, ~~one that would the progressive paradigm.~~

But as Kuhl points out in his The Structure of Scientific Revolutions(1962) such a massive reorientation as a paradigm change will not, come easy in any field,.Osborne and Gaebler contend that the approach to solving public problems that the Progressives and New Dealers developed "simply do not function well in the rapidly changing, information-rich, knowledge-intensive society and economy of the 1990s". They "lacked the information technology we have today to monitor the performance of contractors" so they thought the way to get around corrupt contracting was to have public employees carry out services under administrators.(Osborne and Gaebler,p.27). Given modern technology Osborne and Gaebler argue that governments need to focus more on "steering" the ship of state rather than"administering".

To Osborne and Gaebler the Progressive confidence in "neutral

administrators" and "professionalism" blinded us to the consequences of taking control from "families and communities".For as the authors put it:

> We all know that people act more responsibly when they control their own environments then when they are under the control of others.We know that owners take better care of homes than renters.We know that workers who own a piece of the company are committed than those who simply collect a paycheck.It stands to reason that when communities are empowered to solve their own problems, they function better than communities that depend on services provided by outsiders. Osborne and Gaebler,p 51.

"Entrepreneurial management" seems to combine market type experimentation,down sizing of government, and empowerment plans. These elements point out the subjective nature of their paradigm,something it has in common with every other social and political paradigm.The challenge to long lasting traditions of merit civil service and quality public service delivered by every level of government will not go without trial.In this limited space I will examine merely the role of entrepreneur for city manager that this paradigm suggests and save close scrutiny of the paradigm's other possible merits for later work.

B. City Manager as Entrepreneur

The advocates for the role of entrepreneur certainly have given us food for thought.For it is certainly possible that the advances of modern technology may allow government to downsize in similar fashion to that of the major corporations.Yet we need to separate a mood that welcomes experimentation from a wholesale revision of the notion of governmental work and the role of the administrators in it.Osborne and Gaebler have presented us with the challenge, now we have to move in systematic manner to evaluate their proposal.

' The entrepreneur is the efficiency revolutionary not the efficiency engineer that was the early city manager.This is, of course,

of little consequence to those ingenious fellows who have dotted the history of free enterprise,most particularly it seems in the last twenty years, for they have the confidence that they have the technology,the organization, and the market for the long shot enterprise.Moreover the risk of playing this long shot role is balanced by the profits to be gained.No one can blame the entrepreneur, except perhaps those that gambled with their capital on the project, and normally this relation is legitimated through a partnership or corporate legal structure; such that stock is weighted according to capital contribution as is control.In other words this perilous undertaking is voluntary in nature and memorialized as such by all parties in binding, voluntary legal agreements. Such is the essence of free enterprise.Often the entrepreneur assumes the risk alone or with family capital.

Yet government is not voluntary.Its essential nature is coercive. Taxpayers are not the voluntary participants as are the analogues in the private entrepreneurial venture save for the social contract underwriting the entire democratic system. Moreover many entrepreneurial activities are undertaken with only minimal understanding by the people and oft times by their representatives.This is oft times no doubt the fault of the typical citizen who in our the context of our nonpolitical class culture often chooses realms of enjoyment that are outside politics for his leisure time attention.But just as often a manager using the entrepreneurial role will choose to keep the public in the dark as he develops his policy to the point of acceptance just as his entrepreneurial analogue would in the private market.

Since government ultimately belongs to the people,there is special relation between the manager,the elected officials, and the people.This unique bond is based on the theoretical sovereignty of the people over the government and is juxtaposed to the absolute coercion the government has over the property,liberty, and lives of the governed.Even on the local level property is taken, liberty revoked,and lives taken. This paradox of democratic government is clarified through the bond of trust between the people and their officials.The social contract, the mandate of heaven, and the notion of unalienable rights all call attention to the one clear unmistakable tenet in democratic government: the sovereignty of the people should not be forgotten.

This takes two forms:one is democratic control and the second is a special fiduciary relationship between officials:administrative and elected and the people.(Cooper,1991,p.163;Tong,1986,p.99). A fiduciary is legally speaking an individual granted special powers by an individual or a court.These special powers carry with them a special trust, ie.e., a legal obligation responsibilities that must run concurrent with their term of power.If the fiduciary/trustee fails to discharge those responsibilities then the terms of the charge is void.

The public administrator is different than the risk taking businessman.For the city manager takes an oath of public office to protect the public trust. His special training,education, and experience prepare him for a unique job of running the complex organization of city government in a democratic and efficient manner.Terry Cooper sees public administrators as those "especially responsible citizens who are fiduciaries for the citizenry as a whole."(Cooper, p.139).The "public administrative ethic" is grounded in the social contract, the basis for democracy, and this in turn gives the administrator a special "responsibility" to help create and maintain the political community.

The risk taking adventurer in the private market has no similar burden.The entrepreneur has been given a special role by the community.The political community has deemed it most efficient to put economic decision-making in large part in the hands of private individuals in what we call the free enterprise system.Yet it is the state through its sovereignty that controls all including the structuring of the political economy.The liberal state even in its welfare form has given the risk taking businessman or entrepreneur a great deal of freedom. They have been granted freedom from the political domination of the totalitarian regimes and much freedom from the tethers of democratic political control and political obligation as well. The business entrepreneur's role is narrower than the city manager's, though the entrepreneur's role is sufficiently complicated and important in and of itself to warrant the freedom that its narrow definition provides.

In contrast Cooper properly notes that the"expertise and technical specialization" of the public administrator " should always be placed in its " larger context." of social obligation(Ibid.,p.140).Similarly Rosemary Tong notes that policy

analysts,and city managers are as we have noted are in part policy analysts, and thus have a special obligation,i.e., a fiduciary one, not only with policy-makers but with the general public(Tong,p.99). Tong notes "the superior knowledge that experts have ... imposes special obligations upon them" to both their clients, the policymakers or city councilmen, as well as their ultimate patrons, the general public. "(Ibid.).

The problem for Osborne and Gaebler in Reinventing Government is reality. For they determine that currently elected legislators are predisposed to interest groups.This in turn causes administrators to build interest groups into each piece of political calculus.Thus an entirely different set of inducements exist in the private as opposed to the public realm, turning a profit versus pleasing special interests.(Osborne and Gaebler,p.20).Drucker asserts that a political interest is borne the moment a public service is first delivered for it creates a "constituency which then refuses to have the program abolished or even significantly modified". This makes the necessary changes for the information age so difficult to come by because any change is "opposed by existing constituencies without having, as yet, a constituency of its own".(179).Tipton in noting the policy recommendation role of the city manager recognizes that the council must make the ultimate decision. The problem is "council members, as elected officials, are by nature problem avoiders" thus leaving the city managers to "make the hard choices between competing interests in the creation of policy"(179).

The solution to a gridlocked political system for both the information age futurists and city managers advocates desiring more flexibility of maneuver is the "opportunity-focused" and pro-active entrepreneur role for city managers.An ethical problem arises when public support for change is not a "spontaneous groundswell" but is that is "created by the entrepreneur".(Bingham and Felbinger,in Frederickson,1989,p.248).For the role of entrepreneur that is advocated by our information age futurists and those desiring to expand the role of the city manager role yet further contradicts the positions of those ethicists who want to ground the role in the social contract.

The ethicists' concern flow from democratic theory rather than the problem of coping with reality.Cooper, for example, thinks that

managers "should be held ethically responsible for encouraging participation of the citizenry in the process of planning and providing public goods and services."(Cooper,p.141). Rather than the entrepreneurial manipulation of coaptation Cooper wants the administrator to take his time in encouraging participation for he desires " a subordination of administrative expertise to community leadership and authorities,rather than the assertion of superiority to lay citizens based on technical knowledge and skill".(Cooper,p.162). This populist concern extends further for the "administrator's most fundamental responsibility is to encourage and support existing communities". The city manager needs to focus on community building in his activities rather the slick mobilization of opinion behind this or that latest need.This concern seems a bit traditional until we recall that city managers have in the last three decades been working with neighborhood groups.It is very possible that this community orientation could be achieved.

Following Freidrich and Yves, Cooper wants the public manager to engage in "reasoned elaboration in terms of the values,beliefs, and interests s of the political community to which they apply.".(162) For as Cooper argues, "An administrator has the responsibility of "upholding the shared values of the community, not through force,coercion or administration fiat, but through reasoning with his or her fellow citizens about the common good."(Cooper,p.163). The city manager would be responsible for not merely encouraging participation in the form of coaptation exercises, nor community building in symbolic terms, but he would need to genuinely become part of the community.

Can this gap between social contract ethicists and information age realists be bridged? Could the desire for innovation amidst political gridlock be meet by the same official who maintains the ethic of the social contract? There are two possible approaches that might allow a city manager to be innovative and truly democratic at the same time.The first approach is that of empathy. Carol Lewis in her The Ethics Challenge in Public Service(1991) presents empathy as a major medium for the public administrator. Empathy is an "appreciation for an understanding of the values of others, a sensitivity for other cultures, beliefs,and traditions".Lewis points out that public managers as "trustees for the vulnerable,dependent, and

politically inarticulate" need empathy.Managers need to become almost a garden type variety anthropologist to understand the variety of cultures in an urban area.

A genuine effort at understanding of different subcultures would lay the basis for an unaffected search for policy alternatives.(Lewis,1991,p.47-48). Empathy in adjusting for class and ethnic cultural bias can lead to disinterested clear-mindedness.(Ibid,p.98). Class and ethnic cultural bias is real in American society and the mostly male,middle class, protestant city managers could use the mental focus of empathy to avoid building such biases into policy recommendations. Lewis recommends stakeholder analysis to implement an empathic approach. John Nalbandian is very close to this approach in his Professionalism in Local Government(1991) for he points out that "managers can help clarify and organize policy discussions if they are able to express the values in the different viewpoints" arising from different communities.(Nalbandian,1991,p.98). In other words the city manager could do a better job at facilitating policy discussion, a basic charge of the manager.

Closely connected to this task of cultural understanding(verstehen) and facilitating policy discussion is the ethical role that city managers have as "educators".(Nalbandian,p.100).Arguably managers are better positioned than council members to educate the public.The joint roles of managerial expert and chief executive give the city manager high status in the policy process. Whether it be explanation of policy alternatives,the values behind them, or the need for innovation when the city manager speaks the political community listens.Council members motives can always be interpreted as political, and at times rightly so.Though there may be obstacles to the manager's playing a truly educative role(Ibid,p.101), the manager is still in the center of information flow and is best positioned to carry out this important ethical charge (Tipton in Frederickson,1989,p.178).

CONCLUSION

The city manager system has survived and flourished for nearly

a hundred years.In that time the perception of the manager has changed dramatically from an efficiency engineer to the more sophisticated view of the manager as a critical player in the policy process. The post World War II era brought an awareness that efficiency could not stand as the single value for city manager.A deeper understanding of the policy process evolved,pointing out the many places where the city manager could make decisions based on his values.The 1960s social upheaval introduced the value of social equity to a new public administration. The city manager now must empathize with the urban downtrodden and find policies to help. The 1970s and 80s brought rapid change in the form of global competition,economic development, micro-computers, tight budgets,and federal mandates.Following the growing independence of the city manager to make value choices,strategic decisions, and to influence policy, the concept of entrepreneur as a proper role for the city manager was introduced.In borrowing from the private sector the paradigm of "entrepreneurial management" and the popularity of several "public entrepreneurial" reforms were confused with the role of the city manager.

The city manager has a broader more responsible role than the private entrepreneur.He is responsible not only to the council but to the people of the city in acting in their interests but also in a democratic manner. He cannot mobilize resources and manipulate them as an entrepreneur might a market; for the city manager has a fiduciary position, a position of trust within democratic government.Social contract ethicists have correctly pointed out the manager should encourage true participation of the people.The manager also has a proper duty to encourage community.

Can the city manager maintain an ethical role in the information age that we have entered?.Can the city manager promote participation,encourage the growth of community, and reinforce democracy in an age where the changes that seem necessary stagger the imagination?I believe that city managers using empathy and education can play a very positive role in the dramatic changes that are to take place.We do not have to give up the social and democratic ethical limitations merely to achieve change.The power and effectiveness of the city manager position needs to be reinvigorated by a charge of ethical idealism designed to reinforce our local

democracy.We do not need to cave into a misplaced analogy,entrepreneur, that would give free rein beyond the trust that binds the manager.

The city manager may choose to play a change agent or may choose to recommend entrepreneurial reforms but in doing he needs to draw his policies out of an empathic understanding for the communities he represents and to decide upon alternatives only after an education campaign.Council-manager government needs to be an open government even in the stressful days ahead.For we must remember that for the average citizen local government represents the only meaningful chance for integration in the American political system.If the manager-council forms disappoints urban America's hope for democratic change in the information age the strong mayor system may not be long in returning.

RACE NORMING, VALIDITY GENERALIZATION, AND EMPLOYMENT TESTING*

INTRODUCTION

Employment tests have been a valuable tool for employers seeking qualified, efficient, and productive employees for over a century. While tests are seen as an effective method available for predicting job performance, they often have a disparate impact on minority groups that, as a whole, score lower than non-minorities.[1] As a result contemporary employers must find ways to choose a productive workforce while at the same time attempting to develop a diversified and balanced workforce.[2] To accomplish this task many employers rely on employment agencies such as the United States Employment Services (USES) -- a branch of the U.S. Department of Labor (DOL) -- to tap into the local labor pools. Over 19 million people apply annually for jobs through the 1,800 local USES offices, and 3.5 million people permanently or temporarily become employed.[3] It is advantageous for individual employers to use employment services, because these agencies implement affirmative action techniques, which shield the employer against liability in employment-related race discrimination lawsuits.[4]

One of the most widely used affirmative action techniques utilized by the USES has been the implementation of "race-norming" or "within-group score conversion" or "score adjustment strategy" in the scoring of employment tests.[5] The USES implemented race-norming with little publicity and no public debate in 1981. The policy took effect shortly after Ronald Reagan became President. Race-norming has developed into a highly controversial issue sparking heated debate between supporters and opponents. This paper discusses race-norming in employment

*Research support was provided by a Summer 1993 Research Grant, College of Business Administration, Louisiana State University. The author wishes to thank graduate students Brad Baptiste and Greg Anders for their research assistance.

testing, illustrates the widespread use of race-norming nationally, and discusses judicial cases and decisions concerning race-norming and validity generalization. The paper also briefly discusses the findings of the National Academy of Sciences (NAS) study of the **General Aptitude Test Battery (GATB)**, validity generalization (VG), and race-norming. The **GATB** is a most popular employment test being administered to some ten million potential civil servants[6] and some 600,000 job applicants in various states.[7] Some eighteen million individuals a year take various tests of USES.[8]

WHAT IS RACE-NORMING?

Race-norming is an affirmative action technique used to adjust applicant test scores so the number of individuals chosen for referral, and ultimately for selection, will reflect racial proportions in the actual population.[9] The technique was developed by psychologists, test researchers, and statisticians seeking to eliminate racial imbalance and sampling error from tests. The scientific term used by most supporters of the policy is "within-group scoring."[10] To race-norm a test each individual's raw score is given a percentile ranking within the individuals own ethnic group. In other words, every individual's score is compared and ranking against others of their own race. These scores, however, are not ranked in reference to the entire test-taking population.[11]

Research indicates various ethnic groups perform at different levels on standardized employment tests. Historically, Asians and Whites have obtained higher raw scores than other races.[12] Minorities typically score in the following descending order: Hispanics, African-American, and Native American Indians.[13] These minority groups, as a whole, score significantly lower than Whites and Asians.[14] Because of this disparity, a testing agency only

referring individuals with the highest overall test scores would refer a disproportionate number of Whites and Asians as compared to other minority individuals. This would ultimately cause a workforce not reflecting the population, which is considered a disparate impact on minorities. Therefore, race-norming is seen as an approach to prevent those who score better on employment tests, mainly Whites and Asians, from disproportionately getting most jobs.[15]

The need for a system such as race-norming was well documented by the early 1970s, particularly after affirmative action procedures were required by the EEOC. Consequently, an official policy and procedure for race-norming the **GATB** was developed by the DOL. By 1981 thirty-five states were using race-norming to some degree in their employment referral systems.[16] This number had increased by to thirty-eight states by mid-1990.[17]

Race-norming is best described by the following example. Five individuals, an American Indian, a Black, an Hispanic, an Asian, and a White, apply for a blue collar job advertised at their local job service. The **GATB** is administered to all of the individuals and they all received the same raw score (i.e., each person answered 300 questions correctly). These scores are then given a percentile ranking within each person's ethnic group. These percentile scores, not the raw scores, are then reported to the employer. The Asian and White individuals both receive a percentile score of 44, the Hispanic would recieve a 67, the Black would receive an 83, and the American Indian would be awarded a percentile ranking of 89.[18] The rankings are different because each person is compared with members of his own race not with the entire population. These scores were being reported to the employer with no indication of the individual's race, no raw score, and no statement explaining that the scores had been race-normed.[19] Figures 1 and 2 illustrate the percentile conversion tables used in race-norming test scores.

FIGURE 1

PERCENTILE CONVERSION TABLE

Jobs are grouped into five broad families: Family I includes such jobs as machinists, cabinet makers, and tool makers; Family II includes helpers in many types of agriculture, manufacturing, and etc.; Family III includes professional jobs such as accountants, chemical engineers, nurses, editors; Family IV includes bus drivers, bookkeepers, carpet layers; Family V includes exterminators, butchers, file clerks. A raw score of 100 would convert to the following percentile rankings:

	I	II	III	IV	V
BLACK	79	59	87	83	73
HISPANIC	62	41	74	67	55
OTHER	39	42	47	45	42

Alternative Methods to Race-Norming

There are other forms of test score manipulation available to testing and referral agencies, but none of these methods have approached the use and popularity of race-norming. One such method is referred to as **banding**. Banding is a system in which the entire set of test scores is divided into several bands. Once this is accomplished, the band whose racial composition most closely resembles that of the population is selected above all the others and individuals are randomly chosen from within this group. This procedure may result in the elimination of the very highest and the very lowest scoring bands because these are normally over-represented by majority and minority individuals, respectively. The band most often chosen falls in the middle to lower-middle region of the overall testing population.[20]

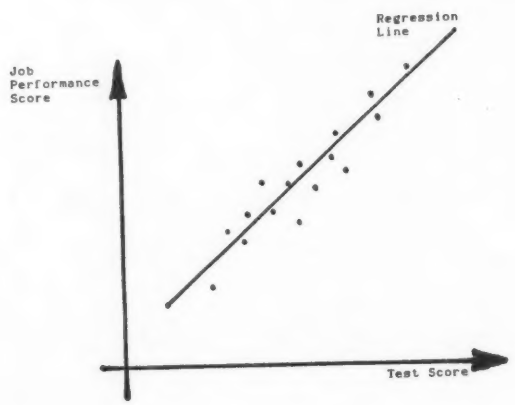
Another alternative used in the **E. F. Wonderlic Personnel Test** is called "minimum-maximum qualification range." In this case all high and low scores are eliminated until the remaining group has roughly equal proportions of minority and majority individuals. A referral group is then randomly selected from this pool.[21]

The **low cut-off method** is also popular among referral agencies, and it is endorsed by the EEOC. In this method the lowest 20% of applicants tested are eliminated from the referral pool. The remaining 80% of the individuals scoring above this low cut-off value are subjected to a random selection process prior to referral. The problem with this method is that is results in an 85% average loss of production and has been shown to result in lower minority hiring rates than other available methods. Not all methods result in loss of productivity. Most similar methods average only a 15% loss in productivity.[22]

VALIDITY GENERALIZATION VERSUS RACE-NORMING

Although the terms validity generalization (VG) and race-norming have been used interchangeably, it is important to note the two terms are not synonymous. VG was developed in 1983 as a statistical technique allowing agencies to validate tests for groups of similar occupations, called job families.[23] This method eliminates the need to perform time-consuming, complicated, expensive, and often statistically impossible validation studies for every job title.[24] Validity is a measure of how well an employment test actually predicts future job performance.[25] VG analysis supports the idea that if the validity of a test is known for a reasonable sample of jobs, then its validity for other similar jobs will fall within a relatively small range. Stated another way, VG analysis provides the predictive validity of a test for jobs not studied. Figure 2 illustrates a sample regression line for a valid test estimating future job performance.

Figure 1. A Hypothetical Scatterplot Showing the Relationship Between Test Scores and Job Performance Scores for Some Validity Study.



SOURCE: **USES Test Research Report No. 46** (1983): 7.

The graph has a positive slope meaning low test scores are correlated with poor job performance and high scores with good job performances. The more accurate test will have higher validity, and employment tests must be validated to be both useful to the employer and legal. Prior to VG a validity study was required for each combination of test and job title to which the test was applied. If a study was not conducted then the testing agency could not prove the test was a valid predictor of performance in the given occupation.[26]

VG allowed USES to administer the **GATB** to applicants in all job classifications. The **GATB** has been used from employment testing since 1947, but it had only been validated for about 500 of the over 12,000 occupational titles listed in the **Dictionary of Occupational Titles.**[27] In 1981 a new and improved version of the **GATB** extended the applicability of the test by generalizing from the five hundred jobs originally covered to all 12,000 jobs in the U.S. economy. The **GATB** is divided into nine aptitudes tested by various written and manual tests. Table 1 below lists these aptitudes and the tests used to evaluate each item. For instance, an applicant's verbal aptitude is evaluated by a written vocabulary test, while manual dexterity is measured with a pegboard test titled "Place and Turn."

TABLE 1: The Nine Aptitudes Measured by the GATB and the TESTS Used for each.

SYMBOL	NAME	TEST(S)
G	General Intelligence	Vocabulary + Arithmetic Reasoning + Three Dimensional Space
V	Verbal Aptitude	Vocabulary
N	Numerical Aptitude	Computation + Arithmetic Reasoning
S	Spatial Aptitude	Three Dimensional Space
P	Form Perception	Tool Matching + Form Matching
Q	Clerical Perception	Name Comparison
K	Motor Coordination	Mark Making
F	Finger Dexterity	Assemble + Disassemble
M	Manual Dexterity	Place + Turn

SOURCE: USES Test Research Report No. 44, (1983): 17.

The ability to validate entire job families using VG dramatically increases USES value to employers. The procedure is designed to increase test vitality, which means an increase in the economic benefits enjoyed by employers. It is estimated poor selection procedures cost the American economy 80 to 100 billion dollars in lost productivity annually.[28] In contrast, race-norming is an affirmative action test score manipulation technique. Race-norming is designed to eliminate disparate impact on minorities who take the tests. Understanding the difference between VG and race-norming may eliminate confusion when the two terms are substituted for one another in the literature.

NATIONWIDE USE OF VG AND RACE-NORMING

USES has almost fifty years of experience and research regarding the use of the **GATB** to predict job performance, which makes it the most widely used and validated employment test presently available to employers.[29] USES monitors the extent to which the **GATB** is used, and has performed similar surveys on the use of VG and race-norming.

When race-norming began to be publicly scrutinized USES contacted the Interstate Conference of Employment Security Agencies, Inc. (ICESA) to conduct a survey to assess the nationwide use of the **GATB**, VG, and race-norming. The survey was completed in January 1992 and results were reported to the individual state employment service administrators in a March 11, 1992 memorandum from the ICESA Equal Opportunity Committee Chair.[30] According to the survey, 50 of the 53 state employment service agencies were using the **GATB** to evaluate job candidates.[31] However, the use of VG and race-norming was perhaps the most interesting aspect of the survey.

ICESA reported the use of VG and race-norming during two time periods. The first period was prior to September 1990 and the second period was between September 1990 and January 1992. It was during 1991 that opposition to race-norming intensified to the point of declaring its use illegal for private testing agencies.[32] Table 2 shows that 33 states were utilizing **GATB**/VG with race norming to some extent as of September 1990. However, following the controversy of 1991, utilization of **GATB**/VG declined to only eight (8) participating states by January 1992. Of these remaining states, Iowa was preparing to eliminate the use of **GATB**/VG, and Montana and North Dakota had discontinued race-norming. In all, twenty-six of the original thirty-four participating states discontinued the use of **GATB**/VG and twenty-eight were no longer using race-norming techniques. However, ten of these states reported they planned to reinstate an improved **GATB**/VG program by 1993.[33]

Employers were reported to be "generally frustrated" and considered this a "loss of a valuable hiring tool"; for this reason USES requested individual state participation in federal, state, and local research projects designed to improve the validity of **GATB**/VG and lessen its disparate impact. Twenty-seven states expressed a desire to participate in federally funded validity improvement research studies, but only six states were willing to develop or participate in state or local projects requiring the use of their own funds. In regard to research on race-norming only four states wanted to participate on a state and local level, while twenty-six were willing to participate in federal research programs.[34] Basically, there appeared to be a general interest in the research projects as long as it did not involve the use of state and local funds.

TABLE 2 GATB/VG USERS

STATE	As of September 1990	As of January 1992
Alaska	ODO	SW

THE DEMISE OF RACE-NORMING

As noted earlier, race-norming of the **GATB** was developed under the Carter Administration and was put into policy practice by the DOL under the Reagan Administration. Race-norming was never debated or approved by the U.S. House of Representatives or the Congress, and the Reagan Administration had no input in the implementation of this policy. However, in 1986 the U.S. Department of Justice (DOJ), under the direction of Assistant Attorney General for Civil Rights, William Bradford Reynolds, challenged **GATB/VG** on the basis it represented reverse discrimination that was in violation of Title VII of the 1964 Civil Rights Act. However, the DOJ agreed to drop its pursuit of this matter if DOL would agree not to expand the system beyond 1986 boundaries before conducting research to justify the system's results.[35] DOL agreed not to extend the system until a panel of the NAS completed "a thorough, scientific evaluation" of the **GATB** referral system including within-group scoring.

Further, Congressional concern developed during the following years. Most notably an amendment to the 1991 Civil Rights Bill was proposed by Democratic Congressman Henry Hyde of Illinois. In addition, Republican Senate Minority Whip, Alan Simpson of Wyoming introduced a similar bill to outlaw the practice.[36] However, the amendment to the 1991 Civil Rights Bill was deleted by the Republicans because the election was quickly approaching and they did not want the Democrats to be able to charge them with "racial-politics."[37] The White House hoped the Congress would take it upon itself to abolish the practice so President Bush would be shielded from any negative fallout. Obviously, most Republicans oppose race-norming. In fact, many Democrats are also opposed to the policy, but they were in a no-win situation politically. Polls showed Whites, 85% of the electorate, were extremely opposed to

any preferential treatment of minorities. In fact, a March 20-23, 1991 poll found 77% of the voters did not approve of race-norming while only 16% agreed with the policy.[38] Democrats were upset with Hyde for openly challenging the policy and drawing attention to it.[39] Hyde's proposal was defeated in the House Judiciary Committee by a 21-13 vote, strictly party-line.[40] However, when President Bush signed the bill into law in November, 1991, a provision was included in the final bill that outlawed race-norming.[41]

THE COURTS, VALIDITY GENERALIZATION, AND RACE-NORMING

Validity Generalization Court Cases

Because the *Griggs v. Duke Power Co. (1971)* case led the way for litigation involving more specific areas of employment discrimination such as questions regarding the use of VG in employment tests.. According to Sharf, by 1987 five case precedents involving VG had been argued in Federal District Courts. Of these the court had ruled in favor of VG four times.[42]

Pegues v. Mississippi State Employment Services, Etc.[43]

The *Pegues* case is a very important case, because of the unusual nature in which it was filed. This was a class action suit brought about by female and Black applicants who claimed the Mississippi State Employment Service (MSES) had racially and sexually discriminated against them through their referral methods. The plaintiffs challenged the validity of the **GATB** and **SATB** (a smaller state-developed test designed for specific jobs). The plaintiffs in this case were poorly educated individuals who were not qualified for the positions they were seeking and were unwilling to relocate. Some of the plaintiffs including Mrs. Pegues had been placed in developmental programs to eliminate these employment barriers, but many showed no interest in the programs and eventually dropped out. This case is most important because it placed the

burden on the plaintiffs to show they or their class had suffered or were likely to suffer race or sex discrimination. In the case the plaintiffs were unable to do so.

EEOC v. Atlas Paper Box Company[44]

EEOC v. Atlas Paper Box Company was heard on January 30, 1987 in the U.S. District Court of Tennessee. At issue was the use of the **E.F. Wonderlic Personnel Test** as a predictor of applicant performance in the clerical department of the company. The EEOC claimed the company had used the test as a way to keep Blacks from obtaining salaried, clerical office positions.

The court held EEOC must meet three requirements if they were to prove their case:

A) EEOC must prove the existence of pattern and practice of race discrimination by Atlas.

B) To prove disparate impact EEOC must show applicants were selected in a significantly different pattern than the application pool, and

C) EEOC must prove the use of these procedures was motivated by race discrimination.

EEOC was unable to meet these requirements. One reason was the expert testimony provided. Dr. John E. Hunter, professor of psychology at Michigan State University illustrated the **Wonderlic Test** was a good measure of cognitive skills. He testified the test was fair and better predicted job performance than any other criteria such as interviews or previous work history. Although Atlas had conducted no validation study of their own, statistically impossible with the given sample size, Hunter testified studies conducted by other agencies had shown the test to be valid for clerks.

The court examined extensive hiring records and found no evidence of race-discrimination. It was never found that Blacks had been rejected in favor of less qualified White applicants. In

addition, very few Blacks had ever applied for positions compared to Whites. For instance, in 1975 only 6% of the applicants applying for clerical positions were Black, and none had scored higher than the lowest scoring White hiree. Many other examples such as this can be found in hiring records dating all the way back to 1969. However, Dr. Donald J. Schwartz of EEOC testified that during the period from 1969-1979, Atlas' hiring practices exhibited statistically significant adverse impact on Blacks, but Thomas E. Geraghty from the University of Tennessee, Chattanooga found no statistically significant adverse impact from 1978 to 1984. Dr. Schwartz agreed.

In its decision the court found the plaintiff had failed to show disparate treatment or disparate impact and the defendant had successfully shown the **Wonderlic Test** was not used simply as a means to discriminate. The policy of VG was upheld without question, and Atlas Box Company received a favorable ruling because they had consistently applied a policy of hiring the most qualified applicant regardless of race.

Friend v. Leidinger[45]

Friend v. Leidinger was argued on October 3, 1977 in the U.S. District Court of Virginia. This was a class action suit filed by Black firemen against the city of Richmond, Virginia. These plaintiffs claimed the city violated twenty-two provisions of the Civil Rights Act because Fire Bureau Employment policies were discriminatory against them as a class. Some of the items the plaintiffs alleged included the excessive punishment and garnishment of wages for accidents involving Black employees compared to those involving Whites; Blacks claimed they were promoted at a lower rate than Whites; Black firemen, as a class, claimed they were intentionally given lower job-performance ratings than Whites; Blacks were subjected to racial

insults from their co-workers; and the plaintiffs challenged the validity of the city's testing procedures for employment and promotions.

Judge Warriner ruled in the city's favor for various reasons. First, no discriminatory impact was demonstrated by the plaintiff's evidence. Most importantly, a *prima facie* case of race-discrimination can be rebutted by a state or municipality by evidence of lack of discriminatory purpose, and evidence showed fire officials had demonstrated no discriminatory intent. In fact, fire officials had, in the court's opinion, made sincere efforts to eliminate discrimination.

In regard to employment testing some interesting arguments were presented. The firemen claimed the test had not been validated for the position of fireman in the City of Richmond and therefore they claimed the test was not job-related. However, the city claimed the test would be statistically impossible to validate in Richmond due to small sample size, but they claimed the test was valid because it had been validated in 55 jurisdictions in the State of California. The city argued the job of fireman in both places was essentially the same, therefore VG allowed the test to be used. The court ruled this use of VG was appropriate according to EEOC guidelines. In addition, the defendants provided evidence the number of Blacks hired was proportional to the Black population in Richmond. The court also felt Blacks were sufficiently represented in high ranking city government positions to rule out any intentional race discrimination by city officials. The court ruled there was not enough evidence to rule on the subject of tests for promotional purposes. For these, and many other reasons, the court ruled completely in favor of the defendants in this case.

The Railroad Cases[46]

One example of VG at work is illustrated in cases involving the Consolidated Rail Corporation. The suits alleged tests given to applicants in the Engineer Training Program (ETP) were not valid predictors of their future job performance since the tests had not been individually validated. Contrail admitted no validity study had been performed on the two written exams used to evaluate applicants in the ETP. However, they claimed the tests accurately evaluated specific knowledge required in the job, and the tests and the job duties were similar ("almost identical") to those of a close competitor, Burlington Northern.

Burlington Northern locomotive engineers had been subjected to tests for many years and there was sufficient data available to validate the tests for the job of engineer. The plaintiffs argued the equipment used was different and could not allow the same test to be applied across companies. The court ruled the equipment was sufficiently similar to allow a capable operator of one locomotive to enter a different type of locomotive and operate it safely and efficiently. Because Conrail's tests were similar to those of Burlington Northern, which had been validated, the court ruled in favor of the defendant Conrail. The position and its duties were the same and the test was a valid predictor under the concept of VG.

Van Aken v. Young[47]

The courts have not always ruled in favor of VG. In *Van Aken v. Young* the concept of VG was completely disregarded. This case involved a class action suit by white fire fighter applicants in Detroit who claimed they had been overlooked in favor of less-qualified minorities and females. They claimed the city's affirmative action policy was reverse discrimination, and further claimed the written tests used to choose fire-fighters were valid measures of job performance. The court did not agree and ruled the city had admitted to a long history of race

and sex discrimination within the fire department. Evidence presented overwhelmingly proved this point. In some years over 300 fire fighters would be hired, none were female or black. The city developed an affirmative action plan to choose the highest qualified minority and female individuals even if more qualified white or male applicants were to be passed over. This procedure was put in place until the racial and gender proportions of hire applicants reflected city populations. The court examined the practice and found it to be an appropriate means of reversing past discriminatory injuries.

One of the plaintiffs' arguments is germane to VG. The plaintiff claimed the written exam should have been used to strictly rank-order all applicants and relied on the expert testimony of Dr. John Hunter of Michigan State. Interestingly, Dr. Hunter had been the expert witness in every other case where VG was ruled on favorably. In this case, he made the same statements as he had previously, but he was soundly defeated. He relied on VG to claim the fireman's written test was valid because good academy performance correlated well with job performance. Hunter was rebuked so powerfully Judge Gilmore wrote in his memorandum of decision that

> Hunter was completely destroyed on cross-examination. He admitted he knew nothing specific about the Detroit Fire Department Academy and its curriculum, and stated that the ability to be a fire fighter depended just as much upon fast reading ability as agility and ability to climb ladders and do other physical tasks that fire fighters perform. He was unable to explain how a person in a wheelchair, who could get the highest grade on a written exam, could be an active fire fighter. He further testified that there was a high correlation between cognitive ability and the ability to be a good lemon picker. Most of Hunter's testimony lacked credibility, and the Court is completely disregarding it.

In Hunter's defense, it must be noted the fireman's test did not have the same statistical power the **GATB** or even the **E.F. Wonderlic Test** did and would have been very difficult for anyone to defend. However, this was a definite defeat of VG techniques. This illustrated the

weakness of relying on VG in all cases. The method only works when the tests are the same and the jobs being tested are very similar, and as one can see, when these requirements are not met the courts will not be kind.

Race-Norming Court Cases

Following the *Griggs* decision many employers began to abandon testing altogether fearing charges of discrimination. Some employers recognized the need for affirmative action but desired the utility of tests. Procedures were developed to satisfy both requirements. A technique called the "bottom-line" defense was developed. This normally involved tests utilizing the low cut-off method as a pre-screening device followed by preferential selection of minorities from the remaining group. Minorities were selected until the racial proportions were appropriate. Employers hoped minority employees being chosen to satisfy the bottom-line would shield them from adverse impact claims. They further reasoned that if the bottom -line were satisfied tests would not have to be validated. This was defeated in the 1982 Supreme Court case of *Connecticut v. Teal*. The *Teal* case is a landmark race-norming case, which resulted in the virtual abandonment of tests by many employers.[48]

The *Teal* case revolved around a group of Black Connecticut State employees who were eliminated from consideration for permanent supervisory positions because they failed a written exam. The state relied on the "bottom-line" defense in this case citing the fact that Blacks in supervisory positions were proportional to Blacks in the population. The test being administered had not been validated and the Black employee passing rate was only 68% that of White candidates. The courts have established a test is fair if minority passing rates are within at least 80% of majority passing rates. This is referred to as the four-fifths rule. Therefore, this test

had adverse impact on minorities and because this test had not be validated the court ruled in favor of the plaintiff.[49]

Guardians v. New York[50]

The case of the *Guardians Association of the New York City Police Department v. Civil Service Commission of the City of New York* was decided in the Second Circuit U.S. Court of Appeals on July 31, 1980. The plaintiffs were minority candidates for the position of entry-level police officer. The claimed a rank-ordered entrance exam was not valid and resulted in disparate impact on minority hiring. The city had four other requirements including a physical examination, agility test, psychological profile, and background check. However, these requirements were graded on a pass-fail basis and their legality was not questioned by the plaintiffs. Only the rank-ordered test was under scrutiny. The court under Judge Sifton affirmed and remanded the case in parts. The court found the test to have disparate racial impact because Whites passed the test at a rate of 45.9%, while Blacks and Hispanics had 17 and 20.5 percent passing rates, respectively.

The court further ruled that the test had content validity, and the state had conducted appropriate studies to assure this test met EEOC guidelines. The problem was the test did not differentiate well enough between all individuals. There existed a cluster of individuals surrounding the cut-off level. Thus, the test did not sufficiently differentiate between individuals to justify rank-ordering. Because this procedure resulted in disparate impact Title VII had been violated.

The court required the city to bar any continued use of the exam unless adjustments eliminating adverse impact were made. The judge ordered the development of a new procedure

and required it be approved by the court prior to its institution. The judge also ruled strict adherence to the EEOC guidelines was not necessary as long as the results did not violate Title VII. The state offered to institute an interim quota system, but the court rejected it as unnecessary. In this case, if the city had race-normed the results and hired accordingly it probably would have been acceptable.

Hannon v. Barry[51]

In the *Hannon* case the District of Columbia had developed an affirmative action plan requiring hiring quotas of minority candidates at levels above race proportions in the actual population. The District held this action was required to reverse past discriminatory practices. The United States, plaintiff in this case, argued that statistics showed the workforce of Washington, D.C. already has proportional minority representation, and any affirmative action plan would tend to discriminate against non-minorities. The court agreed and judged that in the absence of any current discrimination an unnecessary affirmative action plan violated Title VII of the Civil Rights Act. The court added the District had failed to consider non-race-based alternatives, and their goal of achieving racial parity was constitutionally invalid. The court accordingly ruled in favor of the plaintiff and declared the unnecessary affirmative action plan in violation of Title VII.

In other important cases concepts similar to race-norming were upheld by the courts. In *Kirkland v. New York State Department of Corrections* minority prison guards complained a rank-ordered promotional exam was discriminatory. A settlement agreement was developed, and after reviewing lengthy sets of data the court approved the plan. The plan called for and approved "banding" procedures where applicants in appropriate zones were chosen for selection

by a random process instead of rank-ordering.[52] In this case a rank-ordering process was found to be discriminatory and random selection would eliminate any disparate impact.

In a similar case, *Vulcan Society v. Fire Department of White Plains* a settlement agreement was reached between a class of minority fire-fighters who alleged racial discrimination in the written employment test. The cities involved all used the same test developed by the City of New York for its fire department. This test had been previously ruled to be in violation in New York and as a consequence, it was declared discriminatory in the defendants' respective cities. The final results was an agreement to keep the test but to change it from a rank-ordered exam to a general qualifying, pass-fail, examination. The court ruled the settlement agreement was justified under Title VII and satisfied the intent of EEOC guidelines.[53]

Bushey v. New York State Civil Service[54]

Bushey involved the failure of minority passing rates to meet the four-fifths rule in comparison to non-minority success rates on a promotional examination in the New York Department of Corrections. Originally minorities only passed the test at a rate of 25% compared to 49% for Whites. The city then instituted a score adjustment procedure where minority candidates raw scores were adjusted with bonus points. Whites challenged this procedure as reverse-discrimination since qualified Whites were not being selected in preference to apparently less-qualified minorities. A district court agreed the procedure was illegal, but on appeal, the courts ruled it was justified. They ruled in this manner noting the system did not eliminate any eligible non-minority candidates from the referral pool, nor did it absolutely bar non-minorities from advancement. The court held the procedure valid because of its ability to limit the adverse

impact of the test and because it was only temporary in nature. This was a major victory for supporters of race-norming and similar affirmative action procedures.

A similar case, *Higgins v. City of Vallejo*, was heard in 1987. In this case a White fire-fighter ranked number one among all candidates for promotion was not chosen for the position. Instead a Black fireman ranked third among the candidates was awarded the promotion in accordance with the city's affirmative action plan. Higgins filed reverse-discrimination, but was defeated. The court ruled the promotion was not a violation of the city charter or its affirmative action plan; the plaintiff was unable to prove the plan violated Title VII of the Civil Rights Act; and the plaintiff's Fourth Amendment rights had not been violated.[55]

The above cases are only a sample of the myriad of VG and race-norming cases brought before courts. The decisions tended to favor affirmative action procedures except in cases where little or no effort appears to have been made to validate the procedures or monitor their results. The courts appear to have a liberal slant or concentration in their decisions. Basically, the employer seems to carry most of the burden of proof in matters involving race-discrimination, and the employees filing adverse impact claims tend to have an advantage in our legal system.

THE NATIONAL ACADEMY OF SCIENCES STUDY

Due to a 1986 agreement with the DOJ, a study of the GATB/VG and race-norming was required to be conducted by a neutral organization before GATB/VG could be extended beyond its 1986 boundaries.[56] The National Academy of Sciences (NAS) was contracted to conduct the study, which took more than two years to complete, and many important topics and rumors were addressed using scientific methods and advanced statistical procedures. The results of these studies are published in over fifty detailed reports issued by USES. Much of the work

conducted by NAS involved repeating advanced statistical experiments originally conducted by J.E. Hunter in the 1970s and early 1980s.[57]

The Committee's Report offered a number of policy recommendations for the fair and reasonable use of the **GATB**.[58] The NAS found the **GATB** to be of reasonable quality, having a moderately meaningful relationship to job performance. The Committee supported the use of VG, but added that **GATB** scores alone are not enough to refer and finally choose employees. The NAS recommends the use of multiple criteria such as educational history, and past work experience to choose employees. In the Committee's view even tests of moderate validity such as **GATB's** 0.3 translated into increased production and performance gains for individual employers. However, the Committee added:

> The economic gains from using an instrument of 0.3 validity, are not sufficient in the Committee's judgment to justify its widespread use without some form of score adjustments, given the enormous adverse impact it would have on minority job seekers.

The Committee recommended **GATB** score adjustments be maintained to equalize the chance of referral for Whites, Black, Hispanics, and other minority individuals who would all do well on the job. Further the Committee recommended full disclosure of both the race-normed and raw scores to the applicant and the employer.

Finally, the Committee realized and admitted the use of race-norming will result in some economic loss. It estimated this loss of efficiency to be between 10 and 20 percent. This loss in production is the cost of providing minority workers the same chance of referral as able majority workers.

CONCLUSION

On the subject of race-norming there appear to be experts on both sides of the issue. It is an emotional subject touching the lives of millions of individuals. People are drawn to the subject because it revolves around our human concept and need for fairness, and it is unlikely any policy developed will ever be fair to everyone. Blacks and other minority groups want employment tests allowing them to compete and giving them an equal opportunity for employment. Whites, on the other hand, feel cheated as individuals if they are overlooked for a position in favor of an apparently less-qualified minority.

However, until the races all share an equal place in society inequities will continue. Until then affirmative action plans such as race-norming will have to be used to force society to move forward. On the one hand, very few individuals find VG to be offensive. On the other hand, race-norming is offensive to many individuals.

Supporters of race-norming typically present logical, unemotional, and scientific evidence to support their positions. Yet, critics of VG and race-norming are normally highly emotional and almost pleading. Blits and Gottfredson consider VG and race-norming to be Marxist, and argue that America will once again be thrown into a feudalistic society where lineage and birth would predict a person's rights and standing in their community.[59] However, race-norming appears to be an effective and useful technique allowing employers to reap most of the economic benefits of testing, while accomplishing equal employment opportunity and diversity goals.

Drew University

("Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993. Copyright by the American Political Science Association.")

ABSTRACT

JEWISH VOTERS AND PRESIDENTIAL ELECTIONS:
THE RECORD, THE REASONS, THE FUTURE

Neal Riemer
Drew University

78 to 86% of Jewish voters supported Bill Clinton in the 1992 presidential election. This compares to the national vote of 43% (Clinton), 38% (Bush), and 19% (Perot). Only African-Americans cast a comparably overwhelming majority for Clinton--82%. The 78-86% Jewish vote for Clinton makes Jewish voters more pro-Clinton than Democrats in the country at large, who supported Clinton by 77% By way of contrast, Catholics voted 44% for Clinton; white Protestants, 33% for Clinton, and white born-again Christians, 23% for Clinton. The Jewish vote in the 1992 presidential election thus clearly confirms the solidly liberal and democratic bent of Jewish voters. The average Jewish percentage vote for Democratic presidential candidates between 1928 and 1988 has been 75%. In the 1992 election, religious commitment, gender, age, education, financial well-being reveal no departure among Jewish voters from strong majority support for Clinton. Democratic voting and liberal identification reflect a strong Jewish commitment to church-state separation, social issues such as human rights, peace, the environment, women, social welfare programs, and the groups and symbols of liberal America.

Beyond the superficial reasons for Jewish support for Clinton in 1992--distrust of the policy positions of Conservatives and the Religious Right; distrust of Bush/Baker statements on Israel; support for a vigorous governmental response to economic malaise--four broader and deeper reasons suggest themselves: religious, historical, sociological, realistic. The religious values are those of tzedakah (righteousness), Torah/Covenant, and chiyim (life). The historical reasons include the biblical Exodus; medieval and modern persecution; the liberal Enlightenment; Ha Shoa (the Holocaust); and the establishment of the state of Israel. The sociological factors include liberal parents and grandparents, urban life, and higher education. Enlightened self-interest leads to efforts against anti-semitism and economic and social malaise, for equal opportunity and meritocracy, and for the state of Israel.

Given Jewish religious values, historical memory, sociological influences, and enlightened self-interest, and absent the Democratic Party's desertion of liberal principles and policies, or a strong pro-Israeli position, Jewish voters will continue to give strong majorities to Democratic presidential candidates.

Jewish Voters and Presidential Elections:

The Record, The Reasons, The Future

Neal Riemer

I. INTRODUCTION

In this paper I propose to do three things. Initially, I shall, after summarizing the record of Jewish voters in the 1992 Presidential election, briefly compare Jewish voters in that election with the 1992 voting record of other groups, and then with the presidential voting behavior of Jewish voters in the period 1928-1988. I shall, secondly, attempt to set forth some hypotheses about the reasons for the voting behavior of Jewish voters in the 1992 presidential election, as we can better understand that behavior in the light of the fuller record since 1928. Finally, I shall speculate on the future voting record of American Jewish voters in American presidential elections.

II. THE RECORD

If we use as our guide the American Jewish Congress study of The Jewish Vote in the 1992 Presidential Election[1], it appears that 86% of Jewish voters supported Bill Clinton; 10% supported George Bush; and 4% supported Ross Perot. This compares to the New York Times (VRS) figures of 78% Clinton, 12% Bush, and 10% Perot.[2]

The Jewish vote for Clinton--whether 86% or 78%--contrasts strikingly with the national vote. Using even the lower New York Times (VRS) figure of 78%, the contrast in the national vote is 43% Clinton, 38% Bush, and 19% Perot. Only African-Americans cast a comparably overwhelming majority for Clinton--82%.

The 78-86% Jewish vote for Clinton makes Jewish voters more pro-Clinton than Democrats in the country at large, who supported Clinton (according to the New York Times poll) by 77%. Again, by way of comparison, Clinton received 68% of the liberal vote, 48% of the votes of moderates, and only 18% of the conservative vote.

The Jewish vote in the 1992 presidential election also provides some striking comparisons with other religious groups in the United States. Thus, according to the New York Times's "Portrait of the Electorate," white Protestants voted 33% Clinton, 46% Bush, and 21% Perot. Catholics voted 44% Clinton, 36% Bush, and 20% Perot. White born-again Christians recorded

the lowest support for Clinton (23%) and the greatest support for Bush (61%); Perot received only 15% of their vote.

The Jewish vote in the 1992 presidential election thus clearly confirms "the solidly liberal [and democratic] bent of Jewish voters."[3] In the American Jewish Congress study, 67% of Jewish voters identified themselves as Democrats, 19% as Independents, and 13% as Republicans. Moreover, by "63% to 4%, the Democrats were felt to care more about Jewish concerns than Republicans."[4]

What is also striking is that even Jewish voters who identified themselves as conservatives gave Clinton strong majority support. The breakdown, according to political orientation and vote, was as follows: Liberal--96% Clinton; Moderate--86% Clinton; Conservative--67% Clinton.[5]

Religious commitment, gender, age, education, financial well-being--in the American Jewish Congress study--reveal no striking departure from strong majority support for Clinton. For example, his support among major Jewish denominations was very high: 87% among Reform and Conservative Jews; 86% among Secular Jews; and even 82% among Orthodox Jews. Those who attended synogogue weekly supported Clinton 86%; those who hardly attended, by 77%.[6] Interestingly, Jewish women gave Clinton 90% of their vote, while Jewish men gave him 81% of theirs. Moreover, all Jewish age groups overwhelmingly supported Clinton: those 18-29 by 84%; those 30-44 by 82%; those 45-59 by 83%; and those 60 or more by a whopping 90%. In addition, all educational levels gave Clinton their resounding support: high school graduates--89%; some college--85%; completed college--83%; graduate/professional school-88%. Finally, financial situation (in striking comparison with the general electorate) seems not to have been the decisive factor in the disposition of Jewish voters. Those better off in 1992 (in comparison with 1988) still supported Clinton with 78% of their votes; this in comparison to the 24% of the general electorate--according to the Voter Research Survey, reported in The New York Times. Jewish voters worse off gave Clinton 90% of their vote in comparison with the national average of 61%. And those whose family situation had remained the same supported Clinton 86%.[7]

If we now examine the presidential voting record from 1928-1988, we are able to place the 78-86% vote for Clinton in historical perspective. Using the figures in Lee Sigelman's splendid article, "Jews and the 1988 Election: More of the Same?,"[8] we discover that--with the sole exception of the 1980 election--Jewish voters have given strong majorities to Democratic presidential candidates. The percentages for Democratic candidates are as follows:

1928:	Smith --	72%	
1932:	Roosevelt--	80%	
1936:	Roosevelt--	85%	
1940:	Roosevelt--	95%	
1944:	Roosevelt--	90%	
1948:	Truman--	67%	
1952:	Stevenson--	70%	
1956:	Stevenson--	67%	
1960:	Kennedy--	82%	
1964:	Johnson--	90%	
1968:	Humphrey--	82%	
1972:	MGovern--	65%	
1976:	Carter--	70%	[64% according to New York Times]
1980:	Carter--	45%	
1984:	Mondale--	70%	[67% according to New York Times]
1988:	Dukakis--	70%	[64% according to New York Times]

Sigelman rightly notes that the relatively lower Jewish votes for Harry Truman in 1948 and Carter in 1980 requires a reminder. If one added to the Truman vote in 1948 the Jewish vote for third-party candidate Henry Wallace, and to the Carter vote in 1980 the third-party Jewish vote for John Anderson, the liberal Jewish vote for liberal presidential candidates would go up to 82-87% for Truman/Wallace, and to 60-65% for Carter/Anderson.

The average Jewish percentage vote for the Democratic presidential candidate from 1928 to 1988 was 75%. Roughly, then, three out of four Jewish voters tended to vote for the Democratic Party's presidential candidate. The Jewish vote for Clinton in 1992 was thus better than the average of 75% between 1928-1988. It compares favorably with the Jewish vote for Franklin D. Roosevelt and for Lyndon Johnson, and also for Hubert Humphrey and John F. Kennedy.

Jewish voters have voted more consistently for Democratic presidential candidates than white Protestants or Roman Catholics. And it is only since 1964 that African-Americans have voted more Democratic than Jews in presidential elections. (If the American Jewish Congress figures for 1992 are more accurate than the New York Times Voter Research and Surveys data, the Jewish percentage for Clinton--86%--exceeded the African-American vote--82%-- for Clinton.) Even in 1980--Carter v. Reagan--Jewish Americans voted 15% more Democratic than the overall Democratic vote in the country for Carter.[9]

The Jewish voters' commitment to Democratic presidential candidates coexists with a strong commitment to political liberalism. In his 1989 study of "The Dimensions of Jewish Liberalism," for the American Jewish Committee, Steven M. Cohen--another keen student of Jewish voting behavior--wrote: "American Jews are political liberals. While as a group their political

attitudes range over the entire ideological spectrum, from left to right, the American Jewish political center is situated to the left of that of the larger society. Although not all Jews are liberals, proportionately more Jews are liberal than other Americans, and fewer are conservative." Moreover, on social and political issues, writes Cohen, "Jews are extraordinarily liberal in three broad areas: church-state separation; the social issues [especially issues involving human rights, peace, the environment and women], and identification with the groups and symbols of liberal America."[10]

According to Charles S. Liebman and Steven M. Cohen: "Democratic voting and liberal identification [among Jewish Americans] reflect a package of political and social attitudes. These fall into six overlapping areas, or dimensions of liberalism: (1) support for social welfare programs, (2) sympathy for minorities, (3) commitment to civil rights, (4) support for civil liberties, (5) extreme dedication to the separation of church and state, and (6) a nonmilitaristic, noninterventionist foreign policy."[11]

Lee Sigelman also underscores the Democratic and liberal disposition of Jewish American voters. In his 1991 article he identified liberalism as the "Lay Religion" of American Jews. He wrote that the "primary features" of the portrait of American Jews are their "steadfast Democratic sympathies and unusually liberal leanings." On specific issues, Sigelman wrote, Jewish Americans stand out, first and foremost in their widespread support for Israel.... But they also rank at or near the top in their identification with the civil rights movement, the peace movement, the environment movement, and especially the feminist movement and the gay rights movement. And they fall at or near the bottom of the seven groups [compared] in their support for the anti-abortion movement and the National Rifle Assocation. On the most heated issues facing the nation, then, Jews are--to a far greater extent than white Protestants and, indeed, to an extent unmatched by virtually any other racial, ethnic, or religious group--carriers of the liberal creed."[12]

It would seem, then, that Jewish voters have generally given significant majorities to Democratic presidential candidates--including Bill Clinton-because they have perceived such candidates to be liberal candidates.

But, more fully and more deeply, what accounts for the liberal disposition of Jewish voters and their support of Bill Clinton in the 1992 election?

II. THE REASONS

Superficially, apropos of Jewish support for the Democratic Party candidate, Bill Clinton, several factors suggest

themselves. These include Jewish distrust of the policy positions of Conservatives and the Religious Right in the Republican Party. They include a distrust of Bush/Baker statements and policy toward Israel. They include the economic recession of the early 1990s, which prompted calls for a more vigorous liberal governmental policy. They include a more favorable disposition toward the more liberal candidate, Bill Clinton, as the candidate of change in the new era marked by the end of the Cold War.[13]

In this article, however, I should like to explore beyond these more superficial pro-Clinton and anti-Bush arguments, and attempt to identify the deeper underlying factors that might explain both strong Jewish support of the Democratic Party's presidential candidate in 1992 and the strong general liberal orientation of Jewish voters.

There are, I shall argue, four broad, deep, interrelated reasons--religious, historical, sociological, realistic--that account for the generally liberal disposition of Jewish voters, and that leads them to give big majorities to Democratic presidential candidates, including Clinton in 1992.

First, Jewish religious values play a significant part.[14] The religious values of tzedakah (righteousness), Torah/Covenant, and chiyim (life) highlight--respectively--(1) a religious, and strongly prophetic, commitment to peace, freedom, social justice, economic well-being for all God's creatures; (2) mitzvot (commandments) on behalf of covental law and order, a caring community, education and learning, and (3) respect for life in this world (and therefore a strong commitment to human rights, equal opportunity, good jobs, good education, good housing, and good health care). This cluster of religious values significantly defines the political liberalism of Jewish Americans and illuminates the meaning of the Jewish dedication to Tikkun Olam--repair of the world.[15]

These generalizations are supported in the recent polling data. 80% of Jewish voters queried in the American Jewish Congress 1992 study agreed with "health care for the needy, the use of public funds to stimulate the economy, and the need to continue to provide foreign aid." 69% of Jewish voters also would respond to Black-Jewish tensions by "reaching out to the Black community.: And 60% held that "the government is not paying enough attention to the needs of Blacks and other minorities."[16]

Second, Jewish historical memory of key events reinforces the Jewish dedication to, and hope for, freedom. These events include the biblical Exodus; medieval and modern persecution and pograms; the liberal Enlightenment--a movement for freedom and

cultural opportunity; Ha Shoa (the Holocaust), which reminded Jews in the 20th century of the need for eternal vigilance on behalf of human rights; and the establishment of the state of Israel.[17]

These historical memories--of slavery and freedom, of persecution and enlightenment, of destruction and rebirth--have served to make American Jews hypersensitive to anti-Semitism, as well as deeply committed to democratic and constitutional government that preserves religious freedom, ensures equality of opportunity, cares for the needy, and celebrates life.[18]

Third, certain sociological factors undoubtedly reinforce the commitment of Jewish voters to liberalism--understood as freedom, equality, and social justice--and to Democratic presidential candidates. For example, Jewish voters vote the way they do because of the influence of liberal and democratic Jewish parents and grandparents--who, for example, supported Franklin Delano Roosevelt with percentages of 80, 85, 95, and 90 percent. Jewish voters also tend to be more liberal and democratic because, in the past, they have lived in urban areas--for example, cities such as New York--which were overwhelmingly Democratic. They also tend to be more liberal because they are highly educated; they have gone not only to college--and often liberal colleges--but also to graduate school.[19]

Finally, the behavior of Jewish voters must be understood in terms of a realistic, enlightened self-interest: their enlightened self-interest in fighting against anti-Semitism and discrimination; in fighting for religious freedom in particular and human rights in general; in fighting for equal opportunity and meritocracy--in education, business, social life in general; in fighting to protect the state of Israel; in guarding against economic and social malaise (and therefore fighting for good jobs, housing, education, health care, law and order)--fighting against the malaise that constitutes a fertile breeding ground for anti-Semitism, lawlessness and disorder.[20] Surprisingly, increasing affluence--which inclines other richer Americans to vote Republican--does not, to the same extent, dispose affluent American Jews to vote Republican.[21]

III. THE FUTURE

Because the fundamental reasons--attributable to religious values, historical memory, sociological influences, enlightened self-interest--will endure, it is most likely that the commitment of Jewish voters to liberalism and to the more liberal political party and candidate--the Democratic Party and presidential candidate--will also persist.

This commitment will persist unless the Democratic Party or its presidential candidate should desert the liberal orientation,

or desert a strong commitment to Israel; or unless the Democratic Party gets entangled in an unpopular war; or unless the country under a Democratic Administration becomes mired in a persistent recession. Of course, circumstances--for example, hostility to quotas, extremist Democratic Party positions, Jewish affluence--may to some extent alter the percentage support for the Democratic presidential candidate. But absent fundamental desertions, an unpopular war, a deeply ailing economy in a Democratic Administration, the fundamental commitment of Jewish Americans will remain liberal and they will continue to give strong majorities to the Democratic nominee for President.

The message for the Republican Party and its presidential nominee--if they are interested in increasing support by Jewish voters--is reasonably clear: Move away from identity with the Conservative and Religious Right and toward the moderate center, if not a more pragmatic liberal position on at least a number of key issues. Moreover, Republican Party strategists should not place too high a reliance on increasing Jewish affluence as ensuring a move of even affluent Jewish voters into the Republican camp. Similarly, they should not count on African-American anti-semitism in some quarters of the African-American community as the overriding factor that will frighten Jewish Americans into abandoning their strong identity with liberal policies and Democratic Party candidates.

President Clinton, who came into office as a moderate to liberal Democrat, is now perceived by most Americans as a liberal to moderate Democrat.[22] This perception may hurt him a bit among conservative Democrats, among some Independents, and even among progressive Republicans. However, this more liberal identity will not, I believe, diminish his appeal among Jewish Americans. Indeed, if he can deliver on a goodly portion of his program--for example, reducing the deficit, stimulating the economy, enhancing job-growth, securing national health insurance, safeguarding civil rights and liberties, protecting the environment--the percentage of his support among Jewish voters may actually increase over the impressive 1992 results. A big "if" I concede!

If, however, Jewish voters should perceive Clinton as deserting sensible liberal principles and policies, or a strong pro-Israeli position, he would lose Jewish votes, and his high percentage support in the Jewish community would decline (as did Carter's in 1980).

My current judgment is that there will not be significant slippage in the percentage of Jewish voter support for Clinton, if he survives tough battles in his first year or two in office and runs for reelection in 1996.

End Notes

1. See Martin Hockbaum, Director, The Jewish Vote in the 1992 Presidential Election (New York: American Jewish Congress, 1993). The American Jewish Congress study included 2,885 Jewish voters at more than 100 polling sites. "With 2,885 respondents, the AJCongress exit poll was one of the largest ever undertaken of Jewish voters. By contrast, the number of Jewish respondents in the Voter Research Survey (VRS) jointly conducted by the national networks totalled fewer than 300." p.2.

2. See New York Times, November 5, 1992. The 1992 data for the Times were collected by Voter Research and Surveys based on questionnaires completed by 15,490 voters having 300 polling places around the nation on election day. The New York Times results are reproduced in Seymour Martin Lipset, "The Significance of the 1992 Election," PS: Political Science and Politics, Vol. XXVI, No. 1 (March 1993), p. 12.

3. American Jewish Congress, The Jewish Vote in the 1992 Presidential Election, p. 1. On the solidly liberal and democratic disposition of Jewish Americans, see also the excellent work of Lee Siegelman, "Jews and the 1988 Election: More of the Same?," in James L. Guth and John C. Green, editors, The Bible and the Ballot Box (Boulder, CO.: Westview Press, 1991), pp. 188-203; of Steven M. Cohen, The Dimensions of American Jewish Liberalism (New York: American Jewish Committee, 1989); and of Charles S. Liebman and Steven M. Cohen, Two Worlds of Judaism: The Israeli and American Experiences (New Haven: Yale University Press, 1990), Chapter 5, "Liberalism and Judaism," especially pp. 96-114.

4. American Jewish Congress, The Jewish Vote in the 1992 Presidential Election., p. 3. The AJC study revealed that 35% of Jewish voters indicated that both parties care about the same about Jewish concerns.

5. Ibid., p. 3.

6. Ibid., p. 5.

7. Ibid., pp. 6-8.

8. Lee Siegelman, "Jews and the 1988 Election: More of the Same?," in James L. Guth and John C. Green, editors, The Bible and the Ballot Box (Boulder, CO.: Westview Press, 1991), p. 190. Sigelman reminds us that "Figures at five point intervals represent a consensus of several sources, while those at odd intervals are compromise figures based on differing estimates. All figures in this table should be understood as rough approximations." The figures in brackets for 1976, 1984, and 1988 are those reported in the New York Times, November 5, 1992. The Times noted that the 1976 data were based on a survey

conducted by CBS news; and that the data for other years were based on surveys conducted by The New York Times and CBS news.

9. See Lyman A. Kellstedt and Mark A. Noll, "Religion, Voting for President, and Party Identification, 1948-1984," in Mark A. Noll, editor, Religion and American Politics: From the Colonial Period to the 1902s (New York: Oxford, 1990), Table 16.1, p. 360.

10. Steven M. Cohen, The Dimensions of American Jewish Liberalism (New York: American Jewish Committee, 1989), p. 1 and p. 35.

11. Charles S. Liebman and Steven M. Cohen, Two Worlds of Judaism: The Israeli and American Experiences (New Haven: Yale University Press, 1990), p.101.

12. See Sigelman, op. cit., pp. 189, 190, 191-192. The other groups involved in the cited comparison were "no affiliation," "black Protestant," "Hispanic Catholic," "white Catholic, "white non-evangelical Protestant," and "white evangelical Protestant." According to Sigelman, Jewish support for Israel was 86%. According to the American Jewish Congress study, p. 8, support for Israel among Jewish voters in the 1992 election was 98%.

13. The American Jewish Congress study of The Jewish Vote in the 1992 Presidential Election noted, p. 11, several issues on the domestic agenda of the Jewish community that put them at odds "with the positions taken by the Bush administration and the Republican Party." Jewish voters tended to be pro-choice on abortion, favored "providing more help for the needy and greater government involvement in the economy." This study also noted, p. 11, that Jewish voters perceived Bush to be "overly critical of the efforts of Israel and its supporters to secure loan guarantees." See also Jay P. Lefkowitz, "Jewish Voters and the Democrats," Commentary, Vol. 95, No.4 (April 1993), pp. 38-41. Lefkowitz, p. 40-41, stresses the importance for Jewish voters of the issues of Israel and abortion. He also noted Jewish fears "that Bush had been 'captured' by the religious Right." He also emphasizes the importance of Clinton as a middle-of-the road Democrat. "...Jews who voted for Clinton believed they were getting the best of all worlds: a politically moderate, pro-Israel Democrat.."

14. In my exploration of religious values and political behavior, I am especially indebted to two earlier studies: Lawrence Fuchs, The Political Behavior of American Jews (Glencoe, Il.: Free Press, 1956); and Gerhard Lenski, The Religious Factor: A Sociological Study of Religion's Impact on Politics, Economics, and Family Life (New York: Doubleday, 1961). I am also greatly indebted to the work of Charles S. Liebman and Steven M. Cohen, Two Worlds of Judaism: The Israeli and American Experiences (New Haven: Yale University Press, 1990); and Steven M. Cohen, The

Dimensions of American Jewish Liberalism (New York: American Jewish Committee, 1989). Fuch, p. 178, emphasized as "the distinctive values of America's Jewish sub-culture" "(1) Learning (Torah); (2) Charity (Zedakeh); and...(3) Life's pleasures (non-asceticism).

15. See Liebman and Cohen, op. cit., p. 109 and pp.110-114.

16. The Jewish Vote in the 1992 Presidential Election, p. 1, and pp. 8-10. See also Charles S. Liebman and Steven M. Cohen, Chapter 5, "Liberalism and Judaism," Two Worlds of Judaism: The Israeli and American Experiences (New Haven: Yale University Press, 1990), especially pp. 96-114.

17. See, again, Liebman and Cohen, op. cit., pp. 109-110. See also Michael Walzer, Exodus and Revolution (New York: Basic Books, 1985). Unquestionably, Franklin D. Roosevelt's role in the war against Hitler, and Harry Truman's recognition of Israel were also significant factors in enhancing the support of Jewish voters for Democratic presidential candidates.

18. See Liebman and Cohen, op. cit., pp. 109-110. The Jewish commitment to the celebration of life, one might think, would predispose Jewish Americans to a pro-life rather than a pro-choice position. It would seem that the strong pro-choice position of Jewish Americans "rests primarily on the commitment to individual freedom" and "women's rights rather than the rights of the fetus." For a thoughtful discussion of the Jewish pro-choice position, see Jay P. Lefkowitz, "Jewish Voters & the Democrats, Commentary, op. cit., pp. 40-41.

19. See Steven M. Cohen, The Dimensions of American Jewish Liberalism (New York: American Jewish Committee, 1989), especially pp. 26-29 and 34-36.

20. On the role of realistic, enlightened Jewish self-interest, see the illuminating treatment in Liebman and Cohen, op. cit., pp. 109-110; and also Steven M. Cohen, The Dimensions of American Jewish Liberalism, op. cit., pp. 34-36.

21. See Steven M. Cohen, The Dimensions of American Jewish Liberalism, op. cit., p. 3 and pp. 28-29; and Liebman and Cohen, Two World of Judaism, op. cit.

22. A New York Times/CBS poll indicated that in September 1992 38% viewed Clinton as Liberal, 37% as Moderate, and 13% as Conservative; but that in June 1993, he was seen as Liberal by 49%, as Moderate by 31%, and as Conservative by 11%. New York Times, June 6, 1993, p. 24. During the 1992 presidential campaign, Clinton sought to identify himself as a moderate to liberal candidate; and many saw him as seeking to bring the

Democratic Party back from the Left to the Center. See Joshua Muravchik, "Why the Democrats Finally Won," Commentary, Vol. 95, No. 1, Janaury 1993, especially pp. 18-20. Muravchik notes, p. 20: "Exit polls showed that in 1992 conservative voters still outnumbered liberals by about 3 to 2 (the margin had been almost 2 to 1 four years earlier.) The polls showed, too, that liberals voted overwhelmingly Democratic and Conservatives overwhelmingly Republican, and this ideological commitment remained a stronger predictor of a person's vote than his own economic progress or regress. Half the voters, however, identified themselves neither as liberal nor as conservative but as moderate, and the moderates who had usually divided about evenly, gave Clinton a 17-point margin."

The Impact of Institutional Reform on Electoral Behavior in Taiwan
(draft)

The Impact of Institutional Reform on Electoral Behavior in Taiwan

Shelley Rigger, Davidson College[1]

The conduct of any election is the consequence of the combined effects of formal and informal electoral institutions. Woodall defines institutions as "humanly devised constraints that shape human interaction ... the rules of the game in a given political arena" (Woodall 1993:22). Formal institutions are those constraints which are designed and codified by the state; they are the legal rules of the game. Informal institutions, in contrast, have no legal foundation, but are accepted by the participants in the game as normal practice; they are the tacit, consensual rules of the game. This paper investigates the interaction between informal and formal institutions in elections in the Republic of China on Taiwan.

Taiwan's formal electoral institutions include the legal framework for elections (campaign regulations and the single, non-transferable vote formula); the ROC's multi-layered government structure, which determines which offices are subject to election; the party system, which structures and channels electoral competition; and the organization of civil society (which helps structure citizen participation in elections). Over the years, Taiwanese political actors — party leaders, local bosses, candidates, campaign workers and voters — have developed informal institutions to pursue their own goals within the legal framework established by these formal institutions. From the 1950's to the mid-1980s, Taiwan's election laws changed only incrementally. But beginning in 1986, the ROC government enacted a series of far-reaching reforms in the electoral system. The formal rules under which the 1989, '91 and '92 elections were conducted differed significantly from the pre-reform electoral system, and from one another. This gave rise to the two questions to be addressed here: How well did the informal electoral institutions developed under the pre-reform rules function in the post-reform era? Should we expect these informal institutions to change with the enactment of additional reforms?

Taiwan's Informal and Formal Electoral Institutions

Soon after its arrival in Taiwan in 1949, the Nationalist government implemented a program of regular elections for local government officials. These elections enhanced the regime's legitimacy by giving local elites (and through them, ordinary citizens) a role and an interest in the ROC state. Although the regime was imposed from outside, against strong resistance, within a few years, its strategy of rewarding local leaders who were willing to cooperate (while relentlessly suppressing those who were not) succeeded in

---

[1] This paper is based on research conducted in Taiwan in 1991, including more than 80 interviews with participants in local elections. This research was made possible by grants from the Chiang Ching-kuo Foundation, the American Council of Learned Societies and the K.T. Li Foundation. Many thanks are due to these organizations and to the many Taiwanese who took part in the study.

creating a large group of local notables who identified their personal interests with the interests of the Nationalist party government.

The local politicians extended the reach of the state to the grassroots level by mobilizing personal networks to assist their electoral bids. These networks are called local factions (*ti-fang p'ai-hsi*). Recently, a number of ROC scholars and journalists have published studies of Taiwan's local factions; thus, their overall character is well understood (see Tien 1989:164-171; Wu 1987; Chao 1978a, 1978b, 1989; Huang 1990a, 1990b; Chen 1991). Even in the 1950s, local elections stimulated competition and group formation, but the ban on new parties in effect until 1987 forced most serious political aspirants to channel their ambitions through the ruling party. Under the new party ban, the KMT was the only party capable of presenting a full slate of candidates in each election. Although the existence of small satellite parties and independent candidates provided the potential for competition, in practice, the KMT dominated the electoral arena throughout the pre-reform era. Even today, most faction-based candidates run for office under the banner of the KMT, and faction leaders consult with the party on key decisions.

Taiwan's local factions are local in that they exist only within individual counties; each one's influence ends at the county line. Because a candidate can win almost any ROC election merely by capturing a majority of votes in his or her home county, this is the most efficient size for a local faction. Local factions are clientelistic in that they are based on an exchange of political support and cooperation for political and material benefits. Faction leaders string together chains of supporters in local government (including township [*hsiang*], village [*tsun*], ward [*li*] and neighborhood [*lin*] heads), quasi-official organizations (such as the Farmers' Women's and Water Conservancy Associations), and society (religious, business and community leaders). Vote brokers, known in Taiwanese as *tiau-a-ka*, mobilize support for the factions' chosen candidates.[2] In exchange, the factions give them prestige, political assistance and material rewards (licenses, public works contracts, government jobs and money). In order to maintain their clientelistic networks, factions need access to political and material benefits. Electing members to public office accomplishes both aims: the prestige of holding office is itself a political benefit, while the power of office allows factions to turn public resources to their own ends.

Local factions have assumed political, economic and social functions that put them in direct competition with one another for resources of all kinds, leading to passionate rivalries. Compounding this antagonism is the strong emotional identification many politicians and *tiau-a-ka* feel with their factions. It is not surprising, then, that many politicians speak of rival factions as the "enemy." According to a KMT official in rural

---

[2] *Tiau-a-ka* is a Taiwanese (Minnan) expression, which translates as *chuang-chiao* in Mandarin. (The standard Minnan transliteration is *thiau-a-kha*). "*Chuang*" means a stake or post; "*chiao*" means foot. The compound is an architectural term describing a weight-bearing pillar. Used metaphorically as a political term, it refers to individuals who act as structural supports holding up a political organization. Another common Mandarin term is *chu-tian*, which means the base or starting point for an activity. In politics, it refers to a politician's or faction's representative in a locality. *Tiau-a-ka* is less ambiguous; it always refers to a person. A *chu-tian* could be a person, place or organization. Because local politics in Taiwan is conducted primarily in the Taiwanese language, the Taiwanese word *tiau-a-ka* is the most widely used and easily recognized of the three variants.

Tainan County, "The most important thing, as far as factions are concerned, is to defeat your enemy. And the enemy is the other faction, not the DPP [the opposition party]."

Tiau-a-ka use a variety of techniques to persuade voters to choose the candidates they support. They mobilize their personal connections with family, friends, schoolmates, business associates and so on. They take credit for services the community has received from the state — newly-paved roads, community activity centers, mediation to resolve disputes. *Tiau-a-ka* also exploit voters' reluctance to appear uncooperative, hinting that they will be labeled troublemakers or oppositionists. Finally, they buy votes. Vote-buying (*mai-p'iao*), or bribery (*hui-hsuan*), is an extraordinarily complex element of Taiwanese political life; it deserves a far more detailed treatment than is possible in this essay. For the moment, it will suffice to observe that *tiau-a-ka* pay all the potential voters in their "responsibility areas" roughly the same amount. Giving preferential treatment to some voters usually is counterproductive, as it is impossible to prevent others from finding out. In the few municipalities in which local factions are not a major player in local politics, *tiau-a-ka* are recruited directly by political candidates, often with the assistance of local party officials. The collaboration of local factions, political candidates, party officials and vote brokers (*tiau-a-ka*) to use clientelistic rewards to mobilize votes is what Powell labeled a "clientele system" (Powell 1970).

Under the single, non-transferable vote (SNTV) formula used in the ROC, members of representative bodies are chosen from multi-seat constituencies. Each voter casts his or her ballot for a single candidate, and those with the highest vote totals are elected. In order to maximize the number of contested offices its candidates win in an SNTV election, a party must estimate its potential support accurately, keep unauthorized candidates out of the race and allocate its votes in a way that optimizes its performance. Traditionally, the Kuomintang has used local factions to allocate and mobilize support for its candidates. If the local factions do their job well, the party can allocate just enough votes to each of its nominees to ensure their election, without wasting any. If the factions fail to allocate votes evenly or mobilize them effectively, some KMT candidates will be elected with votes to spare, while others are defeated by challengers from outside the party or by KMT members running without their party's nomination. It is essential that the party control entry of its members into the race, because unauthorized candidacies can undermine the finely-tuned allocation of votes and throw the party's strategy into disarray.

Using SNTV elections to choose high-level representatives is unique to Taiwan and Japan. Students of Japanese elections agree that the SNTV formula has far-reaching consequences for electoral behavior; for example, it promotes clientelistic behavior and personal voting. Rochon was one of the first scholars to use the SNTV formula to explain Japanese voters' strong candidate orientation. He found Japanese no more likely than voters in other countries to base their votes on candidate evaluation *when their preferred party nominated only one candidate*. But when the voter's party nominated two or more candidates in the voter's district, the incidence of personalistic voting shot up (Rochon 1981).[3] According to his analysis, Japanese vote *in* parties, but they do not vote *for*

---

[3] Asked to choose which was most important in their voting decision — party, candidate, or issues — most Japanese chose "candidate" in elections in which there were two or more nominees from the party for which the respondent had voted. The larger the number of nominees, the higher the

parties, because under in multi-member districts party preference alone is not sufficient to select a candidate.

Yang Tai-shuenn's essay, "The Peculiarities of our Electoral System," echoes Rochon's view. He suggests the SNTV electoral formula lies at the root of Taiwan's clientele system. Under the SNTV formula, each voter chooses one candidate from a list. As Yang observes, even candidates in large districts need relatively few votes to be elected, compared to candidates in single-member districts, who must win a majority or plurality. As a result, it is possible to win many Taiwanese elections merely by capturing the votes of people to whom one is personally connected, or to whom one's close supporters are connected. Political views and opinions thus take a back seat to individual and factional relationships, organizational endorsements and group mobilization (Yang 1989:12). Elsewhere, Yang draws an explicit connection between SNTV and the clientele system, writing, "As the candidate pursues perhaps less than 20 percent of the votes, traditional patron-client relations appear valuable ..." (Yang 1992:7). He also points out that vote buying — a basic technique of clientelistic mobilization in Taiwan — is more feasible under the SNTV formula than it would be in system requiring a majority (Yang 1992:7).

If the SNTV formula encourages voters to take a candidate-centered approach to voting, what about the other side of the electoral equation? How does it affect the strategy and behavior of candidates and parties? When the KMT is able to suppress competition from outside the party the SNTV formula reduces the intensity of intraparty conflict and encouraged cooperation among KMT candidates. An SNTV race is not necessarily a zero-sum game; one candidate's victory need not be another candidate's defeat. Instead, SNTV elections have many winners, inspiring a practice among KMT candidates of "dividing (or allocating) votes" (*p'ei p'iao*).[4] Before elections, potential candidates meet with party leaders and faction bosses to estimate the number of votes the party expects to in the district.[5] The sources for these estimates are the *tiau-a-ka* connected to the various participants in the discussion. The party nominates only as many candidates as it can elect, given the number of votes reported. Often, it nominates fewer candidates than there are seats available, leaving room for a handful of non-KMT candidates and ensuring that its votes are not spread too thinly.

---

percentage of voters who said "candidate" was the most important factor. But where the preferred party nominated only one candidate, half the voters said "party" was the most important factor; only 36 percent chose "candidate" (Rochon 1981:8).

[4] This process was described to me by many sources. The most detailed explanation came from a National Assembly candidate who was startled to learn that I had understood a telephone conversation he had in my presence. Having just come from a "dividing the vote" meeting, which he had described on the phone, he was in a particularly good position to explain the process to me.

[5] Theoretically, any group of candidates could agree to divide the vote in their district; but in practice, only the KMT has had the organizational resources and vote share to carry out such a strategy on a large scale. This situation may not continue in the future, however. Non-KMT factions in a handful of counties (including Kaohsiung County's Black faction) sometimes achieve an effective division of the votes they control, and in the past two elections (1991 and 1992), the DPP achieved a rough division of the vote in many districts. Thus, while this description of the mobilization process refers primarily to the KMT, other political forces do occasionally use a similar strategy.

Once the KMT slate is set, the nominees negotiate a division of "turf," assigning to each enough votes to be elected. Obviously, a candidate who wins too few votes will lose; one who wins too many has wasted votes that might have gone to a less popular nominee. If the estimates of vote resources are accurate and no candidate poaches in another's territory, dividing turf makes elections less costly and more predictable for everyone. Before the mid-1980s, the real competition in most elections was finished long before the voters marked their ballots, because what really mattered was the KMT's nominating process. Once nominated and assigned to turf, a KMT candidate was home free. Once they have their party's nomination, KMT candidates concentrate on mobilizing their assigned turf. They need not appeal to voters throughout the district; in fact, they may be punished for campaigning outside their assigned areas.[6] The party encourages its nominees to appeal to voters through personal connections and service, rather than on ideological or policy grounds. That way, it maintains the party center's leadership on policy issues and insulates itself against popular demands filtering up through local politicians. As long as the party controls entry into the race, party support plus a nominee's personal and factional connections usually are enough to guarantee victory.

Other formal institutions of the pre-reform era besides the SNTV formula also influenced electoral behavior in Taiwan. The ban on opposition parties meant voters made party-oriented voting impossible. In addition, strict controls on political campaigns made issue-oriented voting difficult. The election law restricted campaign activities to a short period just before election day (from one day to two weeks, depending upon the office), while politicians who spoke out on certain controversial topics faced severe penalties. TV and radio broadcasts were off-limits to political advertisers, and the KMT controlled most newspapers, either directly or indirectly. As a result, candidates found it all but impossible to make issue-based appeals to voters through the mass media. The concentration of power over even local affairs in the central government undermined candidates' ability to make credible promises to constituents that went beyond pork barrel public works projects and other minor acts of patronage. In short, under the ROC's pre-reform electoral institutions, two key motivations for candidate selection in a democracy — party identification and issue preferences — were useless to Taiwanese voters. With so little independent basis on which to choose a candidate, many voters willingly followed the *tiau-a-kas'* advice when casting their ballots.

Taiwan's Clientele System in the 1990s

Over the first four decades of ROC rule in Taiwan, the clientele system's influence in elections increased steadily. By working through the informal institutions of local factionalism and *tiau-a-ka* mobilization, local KMT branches — and the national party — were able to maximize their success under the ROC's electoral laws. Since the mid-1980s, these formal rules have undergone a number of important reforms. The purpose of this

---

[6] A Taiwanese scholar who lives in the U.S. but continues to be active in elections in his Kaohsiung County hometown described how candidates keep poachers off their turf. Hired thugs patrol the edges of each candidate's assigned territory to prevent opposing candidates' *tiau-a-ka* from entering to buy votes.

section is to address one of the many questions raised by those reforms: How has the informal clientele system adjusted to changes in formal electoral institutions? To answer this question we must first determine whether or not the clientele system was still in use at the time of the most recent elections, five and six years after the end of martial law. If the system is still operating, we need to ask how well it is working. Is it still delivering the desired results?

There is substantial evidence showing that candidates in the 1991 National Assembly and 1992 Legislative Yuan elections did, in fact, use the clientele system to mobilize votes. International observers who reported on the 1991 election found the clientele system to be an important factor in the KMT's 1991 National Assembly campaign (see, for example, Hsu and Chang 1992 and Ling and Myers 1992); my own observations reinforce their findings. In 1992, reports of clientelistic mobilization — vote buying, entertaining, gift-giving, promises of service and pork barrel rewards, local factionalism, organizing *tiau-a-ka* (referred to in news reports as "arranging pillars") — dominated news coverage of the 1992 legislative campaign. For months before the December balloting the *World Journal* (*Shih-chieh Jih-pao*, the *United Daily News*' overseas subsidiary) published reports of vote buying almost daily. The KMT nominated or endorsed some of Taiwan's wealthiest tycoons, apparently hoping their vast resources would compensate for their lack of political experience. But the press and the opposition quickly labeled these candidates "golden oxen" (*chin niou*), excoriating the ruling party for encouraging "money politics" (*chin-ch'ian cheng-chih*). Despite spending huge sums on their campaigns — with as much as 70 percent of the money going to *tiau-a-ka* to buy votes — the golden oxen made a poor showing on election day.[7]

Although there is little doubt many candidates did use the clientele system to mobilize votes in 1991 and 1992, it is not so clear that the system actually delivered the votes the candidates hoped and expected to receive. A variety of indirect measurements can help us estimate how effective the clientele system was in practice. Ordinarily, news reports of an election give only the percentage of votes and seats won by each party. While this measure shows the distribution of power within the elected bodies, it is not so helpful in showing how that distribution was achieved. For example, if party A nominates twice as many candidates as party B, it may not win twice as many votes, but it is very likely to win more, simply because each candidate brings in some supporters. But merely nominating more candidates is not a wise strategy, especially for a small party, which may win more *seats* if it concentrates its votes on fewer *candidates*. For a small party to win one seat in every district would require outstanding organization — but this accomplishment would be hard see in the overall election results. The best way to judge the effectiveness of a party's organization is to compare its performance with its goals. In most situations, a political party's objective is to maximize the number of contested offices

---

7 A Changhua County legislative candidate (KMT) boasted to reporters that he planned to spend NT$600 million (US$24 million). According to the *Far Eastern Economic Review*, the average KMT candidate spent one-fourth that amount, while few DPP candidates spent more than NT$100 million (*Far Eastern Economic Review*, 12/17/92). The 70 percent estimate was quoted in the *Far Eastern Economic Review*, 11/12/92).

its candidates win.[8] The KMT was very successful at attaining this objective in the 1991 National Assembly election, but much less so in the 1992 legislative race.

A party cannot allocate its votes efficiently if too many party members join the race. The number of party votes is finite (although not fixed), and if they are spread too thinly among too many candidates, not all will be elected. Thus, one of the criteria for judging a party's effectiveness in using the clientele system is whether or not it was able to control its members' entry into the competition. By this standard, the KMT performed well in 1991. Only 2.4 percent of all KMT members who registered as candidates did so without the party's authorization. The fact that these unauthorized (or "maverick") candidates took merely 1 percent of their party's total votes indicates the KMT was able to prevent even those who ran from hurting its official nominees. In 1992, however, the KMT's performance by this measure was much worse. Thirty-nine KMT candidates — more than a quarter of all KMT members in the race — ran unauthorized campaigns in 1992; another 13 percent received the party's endorsement, but not its nomination.[9] The mavericks captured 12 percent of the party's vote total. In short, the KMT was able to control candidate selection more effectively in 1991 than in 1992; it was also much more successful at preventing maverick candidates from siphoning votes away from KMT nominees.[10]

Another measure of a party's organizational effectiveness is the success rate of its nominees. A party that estimates its strength accurately, nominates the optimal number of candidates and makes the most of the votes available to it will see a large proportion of its nominees take office. In 1991, 86 percent of KMT nominees were elected, compared with 45 percent of DPP nominees and 2 percent of independents. In 1992, the success rate for opposition party contestants (57 percent overall) exceeded the KMT's (49 percent) for the first time. (The success rate for independents and third-party candidates was 4.6 percent, demonstrating the degree to which the two major parties monopolize Taiwan's political space.) Even if we include only party nominees, the odds of winning were still better for a DPP member (65 percent) than for a ruling party representative (63 percent).

Under the SNTV system, a party which allocates its votes more evenly than its opponents can achieve a seat bonus; that is, the percentage of contested seats it wins may exceed its vote share. Traditionally, the KMT has achieved large seat bonuses in every

---

[8] From time to time, a party may sacrifice this objective to achieve an even more valued result. According to a DPP source, in the 1991 National Assembly election the KMT over-assigned votes to one of its nominees in Hsinchu City, because party leaders decided it was more important to have a KMT candidate finish first in the high-profile contest than to distribute its votes evenly.

[9] The KMT and DPP both release formal nominations lists, and the nominees are the only candidates who receive full support — both organizational and financial — from their parties. From time to time, party members who have not received a nomination decide to run, and the party gives its endorsement (or recommendation). Nominees running in the same district as a recommended candidate have priority in the allocation of votes and other resources. Recommended candidates are considered to be in good standing with the party. A third category of candidates are the "mavericks" or unauthorized candidates who run in violation of party discipline. The KMT occasionally revokes mavericks' party membership.

[10] The DPP gave its blessing only to its official nominees, and only 7 out of 65 DPP contestants (11 percent) ran unauthorized. DPP mavericks captured 2 percent of the party's vote share.

representative election. The seat bonus measures a party's success in translating raw votes into representation in government.[11] The KMT's large seat bonus in 1991 — it captured 78 percent of the contested seats with only 71 percent of the votes cast — indicates that the KMT distributed its votes more effectively than its opponents. As with our other indices, the KMT's performance in 1992 shows a significant decline in its effectiveness over the previous election. Including mavericks, the KMT won 63 percent of the legislative posts with 61 percent of the vote, giving it only a modest seat bonus of 2 percent. The DPP, accustomed to negative seat bonuses (winning a larger percentage of the vote than of the contested seats) managed to make every vote count, winning 31 percent of the seats with 31 percent of the vote. (In 1989, the DPP's seat count lagged behind its vote share by more than 7 percent.)

The measurements used up to this point to evaluate the effectiveness of the clientele system can provide only gross estimates. A more subtle technique would be to analyze election results to see whether each candidate's votes were concentrated in a few polling stations. If they were, that would suggest the party had successfully implemented a strategy of dividing the district into "responsibility areas" and assigning individual precincts to each candidate. A somewhat less detailed — but more manageable — approach is to compare the parties' overall patterns of vote distribution. If each candidate ran as an individual, we might expect the distribution of votes among candidates to be roughly normal; that is, a few candidates would get very few votes, a few candidates would get many votes, and most candidates would fall somewhere in the middle. But in the SNTV system, political parties strive to distribute the votes available to them as evenly as possible. Thus, the distribution that maximizes the number of seats a party can win is one in which all candidates receive about the same number of votes. Candidates who score too low will lose; candidates who score too high waste votes that could have gone to less secure members of their party.

The frequency distributions in Figures 1a and 1b illustrate the best case result for a party under SNTV and a random distribution. Ideally, all the candidates finish at or just above the minimum number needed for election (the quota). Graphically, this distribution would look like Figure 1a (one tall bar in the middle of the graph). A random distribution of votes lacking any coordinated strategy would leave the frequencies evenly distributed across the graph. If a party were completely incapable of allocating votes among its candidates, instead of concentrating its votes near the percentage needed to win, it would spread them all over — with some candidates losing, some winning, and many votes wasted at both ends (Figure 1b). In sum, the tighter the curve, the closer it is to the ideal. As Figures 2a and 2b show, the KMT's distribution of votes in the 1991 National Assembly election (Figure 2a) resembles the ideal much more closely than does the DPP's (Figure 2b). The KMT's votes are concentrated just above the quota needed for election.[12] The DPP's vote distribution is flatter, its votes distributed less efficiently.

---

[11] A party's seat bonus is defined as the difference between the percentage of seats it wins in an election and the percentage of votes it wins. A positive seat bonus indicates that the party was more successful than its competitors in maximizing the effectiveness of the votes it received.

[12] The fact that the second-largest group of candidates fell just below the quota illustrates the problem of over nomination — too many KMT candidates competing for the same votes.

Could the Kuomintang have achieved this result without using the mobilization system? According to KMT leaders, party-oriented voting explains their victory. In fact, a substantial majority of voters did indicate a preference for candidates running under the KMT label. An editorial published in the New York Times just after the election echoed this view. The New York Times attributed the election's outcome to issue-oriented voting — a rejection of the DPP's pro-independence position. In fact, issues received a great deal of attention during the National Assembly campaign , especially the issue of Taiwan independence. The two major parties offered a clear choice on that and many other issues. The DPP supported direct election of the president, which the KMT platform opposed.[13] But most party candidates, especially those nominated by the KMT, did little to distinguish themselves from one another on the issues, and voters attracted by the KMT platform still faced the question, "which KMT candidate should I choose?"

A strong preference for the KMT alone cannot explain the distribution of votes *among* KMT candidates. In a multi-seat election, even a voter who has decided to cast her ballot for a particular party has not yet made a complete voting decision; the question still remains, which party nominee to choose? Candidate-oriented voting also fails to explain the distribution of votes with the KMT. If National Assembly votes had been based on candidate-oriented voting we would expect them to be more — not less — concentrated. Candidates with high name recognition and charismatic personalities could easily overshadow political newcomers. In fact, however, as figure 2a shows, few KMT candidates captured an excessively large share of the vote in their districts.[14] The clientele system, not simply party- or candidate-oriented voting, was necessary for the KMT to have achieved such an efficient distribution of votes and such a large seat bonus.

Once again, the 1992 results tell a different story, as Figures 3 and 4 illustrate. According to Figure 3a, the KMT's distribution of the vote was somewhat less even in 1992 than in the previous legislative election (Figure 4a), suggesting the party's ability to allocate its votes optimally had declined. Even more damaging to the ruling party was the shift of candidates from the category just above the quota (125-150%) to the bar just below the quota (75-99%). In a sense, the KMT's "problem" in 1989 was *too many winners*. The party's 1992 problem was much worse: too many candidates competing for too few votes, with the result that a number of candidates lost. The DPP (Figures 3b and 4b) is consistently less able than the KMT to distribute its votes evenly, although it improved somewhat between 1989 and 1992. But by controlling its nominations, the party avoided the problem of too many candidates chasing a limited pool of votes, and managed to bring a larger fraction of its nominees in over quota.

Evidence from the 1992 election suggests candidates tried to use the clientele system, but in many cases their efforts were stymied. According to news reports, among KMT stalwarts such as military voters the clientele system was effective; candidates supported by the retired servicemen's Huang Fu-hsing Special Party Branch were elected by large margins. But as far as ordinary KMT nominees were concerned, two powerful

---

13 Some KMT candidates opposed their own party on this issue and came out publicly in favor of direct presidential elections. Normally the KMT would disapprove of its candidates' contradicting party policy, but on this issue there seems to have been tacit permission to express opposing views.

14 This result contrasts markedly with the 1992 election, when four KMT candidates and ten DPP candidates received more than twice the votes needed to be elected.

forces outside the clientele system conspired to undermine its effectiveness: crumbling discipline within the ruling party and a backlash against vote buying, the lifeblood of clientelistic mobilization in many areas.

The KMT's fundamental problem in 1992 was its inability to keep unauthorized candidates out of the race. Maverick candidates played havoc with the party's strategy, especially its division of the vote. Left out of the distribution of turf, the mavericks had no reason to respect the boundaries of "responsibility areas," and campaigned wherever they liked. This put pressure on party nominees, who overran the borders of their turf in an effort to steal away enough votes from other candidates to make up for those they were losing to the mavericks.[15] In the resulting free-for-all, the biggest loser was the KMT.

Observers offered various explanations for the preponderance of maverick candidates in the 1992 race. According to National Taiwan University political scientist Chu Yun-han, the alliance between the KMT and local factions had tightened in recent years, squeezing out people with political ambition but no factional connections. In 1992, some of these individuals — mostly wealthy business people — decided to bypass the party-faction axis altogether and run unauthorized campaigns (*Far Eastern Economic Review*, 12/17/92:15). (Another NTU professor, Chen Ming-tong, estimated that 72 of the 165 KMT candidates in the 1992 race were backed by local factions. Another 56 were sponsored by the military [Nathan 1993:428-429].) According to another theory, entrepreneurs no longer trusted the legislators they had supported in past elections to protect their economic interests. They decided the safest option was to represent themselves in the law-making body (*Far Eastern Economic Review*, 11/12/92:18). It is important to note that the problem of maverick candidacies was not without precedent in legislative elections. Maverick candidates bedeviled the KMT in 1989 as well, not least because a seat in the Legislative Yuan is a key post for politicians and factions hoping to improve their economic and political fortunes.

Whatever their reasons for joining the fray, it is unlikely these candidates would have gone ahead if the KMT had maintained its traditional grip on the electoral process. But the party was in the throes of a devastating malady: the breakdown of party unity. In past elections, intraparty conflict was confined mainly to local factions. Of course, KMT officials at the center had disagreements, but they clung to enough of a consensus to project a unified face to the outside world, especially during elections. But by late 1992, the split between President Lee Teng-hui's "Mainstream" faction and the conservative, Mainlander-dominated "Non-mainstream" faction had penetrated the party so deeply that it interfered with the KMT's electoral strategy. In the past, military and other firm KMT supporters — the so-called "iron ballots" — made their votes available to whichever nominee needed them most at the moment the election was held. But in 1992, the military hoarded its votes, heaping them on Non-mainstream candidates at the expense of Mainstream nominees.

---

15 According to an *Independence Evening Post* report, some *tiau-a-ka* accepted money from several different candidates. In an effort to be fair, these vote brokers "allocated them [the votes] according to the amount of cash they have received. As a result, the chairman of the KMT is unable to allocate the votes. On the contrary, a delicate situation arises with the vote bosses in control" (trans. in JPRS CAR-93-015, 3/5/93:43).

The failure of party unity at the national level unleashed an torrent of defections locally. The most damaging of these was the decision by the popular Non-mainstream EPA head Jaw Shaw-kong to run without party endorsement in Taipei County. Another high-level Non-mainstream official, former Finance Minister Wang Chien-hsien joined Jaw's crusade as a candidate in Taipei City. Both men finished first in their districts, drawing large numbers of votes away from other KMT nominees. Jaw captured an incredible 235,000 votes, in a district in which the cut-off for election was only 36,000. If Jaw's votes had been distributed among the KMT nominees in his district, the party might have gained several more seats. Wang's appearance in the Taipei City race had similar — albeit less dramatic — results. Very few KMT members have ever challenged their party this way, because for decades, to do would have ended a politician's career in the party, and because the KMT would have mobilized all its forces to crush its errant offspring. But in the ROC's new, more democratic environment, popularity with the voters is as valuable as popularity with party leaders. Given their vast public support, the party dared not attack Jaw and Wang openly.

Most KMT mavericks were not as famous as Jaw and Wang, but their impact was evident in election results from around the island. Many mavericks made little or no mention of their party affiliation in their campaign activities and publicity materials. Even many party nominees kept their distance from the party platform, in some cases even rejecting it explicitly. One nominee, Chen Che-nan, was expelled from the KMT for advocating the anti-unificationist "One China, One Taiwan" formula and other insubordinate acts. As usual, issues were less important to most candidates than building a favorable public image and mobilizing clientele networks. According to the *Far Eastern Economic Review*, "Local KMT candidates avoid being dragged into this issue [unification versus independence] and prefer to campaign more quietly, relying on factional links and the party's vote allocation system to build support. If they talk about issues at all, the topics are fairer taxes, the need for new construction projects and adjustments to agricultural policy ... (*Far Eastern Economic Review*, 12/17/92:15).

The 1992 elections revealed the volatility of Taiwan's electoral scene. Ruling party candidates tried to use the clientele system to mobilize votes, but the environment in which the system had been effective in the past had disintegrated. The party did not control entry into the race, even by its own party members. As we have seen, if the dominant party cannot limit the number of candidates who compete, the result will be conflict, not cooperation, among its nominees. Where party comrades are at odds with one another, electoral mobilization is a tricky business; it is impossible to carry out a coordinated vote distribution scheme. Given the "every man for himself" atmosphere of the 1992 legislative election, it is not surprising that the KMT's political machine seized up. Could the trouble within the KMT in 1992 be related to the reform process? And if so, how did the KMT avoid these difficulties in 1991?

Institutional Reforms and Recent Elections

The SNTV Formula: The SNTV formula is one of the most important formal institutions for determining how elections are conducted in Taiwan. Even small adjustments in its implementation can change the outcome of elections. Thus, one of the most controversial aspects of the 1991 election was the Central Election Commission's decision to divide the

island into 58 electoral districts (in 1992 there were 27). The DPP protested the small districts, at one point organizing a demonstration at which supporters pelted the Interior Ministry with eggs. The DPP objected in part because the fledgling party lacked the human and financial resources to mount serious campaigns in all 58 districts.[16] The opposition party also argued the small districts constituted pro-KMT gerrymandering because they would facilitate clientelistic mobilization. Small districts are easier to manage for at least two reasons. First, they involve fewer candidates, making it easier to negotiate and enforce the division of turf and other agreements (the average number of candidates in 1991 was 8.4, compared to 12.2 in 1992). Second, larger districts encompass more voters, which complicates efforts to reach out to each one personally. And, of course, the more voters in a district, the more money candidates must spend on vote buying.

Although some DPP candidates were able to take advantage of these phenomena, the KMT's success in dividing its votes suggests that, overall, the small districts did facilitate the smooth operation of the clientele system. They also suppressed competition among local factions, because the smaller districts made room for more factions to be represented, sometimes without having to compete head-to-head. But the very factors that made the ruling party successful in 1991 may have sowed the seeds of its downfall in 1992. According to some political analysts, "The large number of district organisations set up specially for this election not only made it easier to secure votes but also allowed the party to placate its factions by allowing them to choose their own candidates. However, this has enhanced the leverage of local factions" (*Far Eastern Economic Review* 1/9/92). In 1992, when the districts were much larger, the KMT found it extremely difficult to manage the large number of candidates and factions in many districts, with the result that the coordinated party strategy planned for some districts fell apart completely.

Campaign Rules: Prior to the 1990s, the Election and Recall Law Effective During the Period of Mobilization for the Suppression of Communist Rebellion prevented candidates from airing their views and opinions fully; as a result, issues played a less important role in the election than other factors, including clientelistic relationships. The election laws in effect during the 1991 and 1992 elections included significant amendments to that law; in addition, the ROC repealed several laws which previously had constrained candidates' campaign activities. Candidates ignored many other restrictions, including the official "campaign period." In 1991, candidates were to refrain from campaigning until five days before the election. The 1992 campaign period was 10 days long. In both cases, candidates were undeterred, scheduling campaign events well before the official deadline. Evidently, the Central Election Commission had no appetite for enforcing the rule. Other ground rules for the campaigns, those regulating the number of meetings candidates could hold, and whom they could invite to speak, were much more relaxed than in earlier election laws. In 1991, under intense pressure from the opposition, the KMT agreed to allow persons convicted of sedition during the so-called Period of Mobilization for the Suppression of Communist Rebellion (which was lifted on May 1, 1991) to run for office. (Those convicted after May 1 were not eligible.)

---

16 According to news reports, the DPP concentrated its efforts on Taipei and Kaohsiung Cities and a handful of other districts. Beyond that, its candidates were left to their own devices (see Tsai and Myers 1992:28).

Perhaps the most far-reaching change in the election law in the 1990s was the abolition of the long-standing taboo against promoting Taiwan independence. In 1991, the Central Election Commission forbade parties and candidates from advocating independence on television or in the official election bulletin. The DPP responded by leaving blank spaces where pro-independence material would have appeared. The message was conveyed in a way that highlighted the Central Election Commission's restriction of candidate speech. In 1992 the CEC gave the go-ahead to independence advocacy when its TV task force ruled that "One China, One Taiwan" was "only a political idea" which did "not involve the instigation of anti-government acts" (*Free China Journal* November 10, 1992).

Reforms in other areas, including lifting the Period of Mobilization and repealing the sedition law, reinforced changes in the election law. The legislature also repealed the statute under which most political prosecutions had been carried out — Article 100 of the criminal code — to allow non-violent advocacy of Taiwan independence and disbanded three of the ROC's most repressive government agencies — the Taiwan Garrison Command, the National Security Council and the National Security Bureau. The number of names on the government's "black list" (a tally of overseas dissidents prohibited from returning to Taiwan) declined precipitously, until only a handful of names remain today. Government agencies also destroyed the "loyalty files" in which they had previously kept track of public employees' political views.

The issue of Taiwan's national identity (including the possibility of independence) is the most significant difference between the two major parties, so eliminating barriers to an open discussion of the issue was an important step toward institutionalizing issue-based thinking and voting in Taiwan. Other issues played a role in some campaigns; for example, stock market expert Oung Ta-ming played to his strength and won on a platform promising protection for investors. But most candidates still emphasized image more than issues. To be tarred with the "golden ox" brush was a severe blow to even the strongest candidates. DPP and Non-mainstream KMT candidates joined the media and good government activists in condemning vote buying and money politics, with the result that a candidate's image was the most potent factor in most races.

Perhaps the most disappointing reform enacted after the 1989 election was the introduction of TV campaigning. For years, the opposition complained that the prohibition on political commercials made it impossible for them to reach a wide audience. They claimed KMT candidates enjoyed free coverage during news broadcasts (as well as talk shows and even entertainment programs), while the KMT-controlled TV stations ran nothing but negative coverage of the opposition and its activities. Beginning in 1991, the three TV stations were required to run several hours of unpaid political commercials in the weeks before the election. However, the commercials were for parties only, not individual candidates. The goal of the commercials was to shape the parties' image, and they were too general and abstract to be of much use to undecided voters looking for information on candidates and issues (see Tsai and Myers 1992:30).[17]

---

[17] There was one exception, the "Alliance of Independent Candidates," a group of independents who banded together temporarily in order to qualify for television time. The alliance simply stood

The amount of time allotted to each party depended upon the number of candidates it had nominated, which meant the KMT had more than twice as much TV time as any other party. Even worse, most of the small opposition parties were excluded because they nominated too few candidates to qualify for TV time. In both years, the Central Election Commission censored material in the DPP commercials (in 1992, the CEC claimed the DPP presentation defamed Premier Hau Pei-tsun). In short, TV advertising as it was executed in the 1991 and 1992 elections did little to alter the basic patterns of electoral competition.

Government Structure: The fact that these two elections were held at all is itself a triumph of reform. In April 1991, after years of fruitless attempts by the KMT to persuade the senior members of the Legislative Yuan and National Assembly to retire, DPP legislator Chen Shui-pian introduced a bipartisan resolution seeking a ruling on the question from the Council of Grand Justices. They ordered the seniors to step down at the end of their current term, paving the way for a complete renovation of the national representative bodies. In the past, legislative and National Assembly elections were only supplementary; the senior members comprised large majorities. This allowed Kuomintang apparatchiks to dominate both houses, undermining their integrity and legitimacy, as well as that of the supplementary elections. But the Grand Justices' decision raised the ante, introducing for the first time the possibility of a truly representative body at the national level. The most recent elections were a far graver matter than any previous national contest.

If the Legislative Yuan and National Assembly elected in the 1990s are different from their pre-1990 predecessors, they are at least as different from one another. These institutional differences help explain the conduct and results of both elections. Members of the first National Assembly, elected in 1947, enjoyed considerable perks. They were well-paid and received substantial fringe benefits. The job required very little effort, yet members enjoyed the status of high officials. In theory, at least, they had the power to select the president and amend the constitution — powers they rarely exercised. The second National Assembly, on the other hand, is not regarded as a particularly important branch of the ROC government. The political reforms of the late '80s reduced its mandate, so the members elected in 1991 knew they would meet infrequently, and then only to amend the constitution, a fairly dry task by most politicians' standards. As for electing the president, most new members knew there was little chance they would ever exercise that prerogative. Unlike their predecessors, they were to be paid only for the time they spent in session. Moreover, none of the Assembly's activities have much potential for enriching Assembly members or their friends.

All these characteristics of the National Assembly stand in marked contrast to the Legislative Yuan. The legislature is an increasingly powerful policy-making body, with a regular, annual session. It no longer deserves the "rubber stamp" label it wore for so many years (for example, the legislature recently cut the Executive Yuan's proposed budget by

---

each candidate up in front of a camera and let him talk. The quality of the result was irregular, to put it mildly, but at least the alliance's commercials were amusing.

3.9 percent, the largest budget cut in ROC history).[18] More importantly, legislators enjoy innumerable opportunities to channel economic resources to themselves and their supporters. They have access to information, they have leverage in negotiating with bureaucrats, they can even make laws to benefit their clients.[19] Because the reformed National Assembly was a less prestigious and powerful organ, most candidates who took part in the 1991 election were chosen from the "second tier" of their respective parties and factions. The best candidates were reserved for the 1992 contest. For the same reason, local factions took a relatively relaxed view of the '91 race, mitigating the intensity of the competition. In 1992, in contrast, the stakes were high, inspiring aggressive campaigning by all the participants. Given the intensity of the competition for legislative seats, KMT candidates were unwilling to restrain their own campaign activities for the sake of the party strategy.

Party System: The KMT's inability to impose a coordinated strategy on its candidates was an important factor in its 1992 "defeat." The collapse of internal party discipline can be traced to three key factors: the demise of "strongman" leadership after Chiang Ching-kuo's death; the legalization of opposition parties (which increased the competitiveness of elections); and intraparty democratization. The first of these reforms was no accident; before his death, Chiang made sure he would not be succeeded by a politician capable of continuing the "strongman" style.[20] The second reform also originated with President Chiang, who may not have anticipated its far-reaching impact on the KMT's mobilization system. As one reporter put it, "In an open political system with 61 registered political parties, KMT candidates have discovered ... that they can no longer depend solely on money from party headquarters to buy votes and must find their own grassroots support (*Far Eastern Economic Review*, April 11, 1991).

At its 13th party Congress (1988), the KMT implemented a number of new rules aimed at intraparty democratization. For the first time, most of the delegates were elected by the party rank and file, and helped select Central Committee members. Local party cadres were given the right to elect local party chairs and vice chairs, and Central Committee members were instructed to be more active in local affairs (Jiang and Wu 1991:80). The party also took steps toward its first primary election.

KMT primaries are an extraordinarily complex phenomenon, reflecting the party's deep philosophical and strategic contradictions. The concept of intraparty democracy is

---

[18] Political reform has increased the power (or at least the independence) of other elected officials, too. For example, in the spring of 1992 the ordinarily docile Provincial Assembly walked out to protest the loss of their right to select the members of the Control Yuan. They failed to reverse the decision, but the spectacle of KMT and DPP assembly members marching out of the meeting room side by side is a remarkable moment in the history of Taiwan's democratization. The judicial branch, too is carving out a more autonomous role.

[19] During the 1991 legislative session the DPP captured a majority of seats in the Judiciary Committee. The speaker, Liang Su-yung, berated his KMT comrades, whom he said had become so preoccupied with "making money" (*kao ching-chi*) that they let the DPP take over the committee.

[20] For example, Chiang announced that no one in his family would succeed him, and he banished his likely successor General Wang Sheng to the ROC embassy in Paraguay, where he served as ambassador.

most popular with reform-minded liberals, but to date, the party's conservative wing has managed to dominate the primaries to its own political advantage, prompting the liberal wing to look for ways to override their results. Traditionally, the KMT made its nominations in closed-door consultations with local faction heads and party officials. During the 1970s, facing growing competition from outside the party, the KMT attempted to improve the quality of its nominees by sending "paratroopers" into selected races (see Winckler 1981:67-68). These candidates had excellent qualifications, but few local connections. In 1977, local factions across Taiwan withheld their support from individuals they saw as interlopers, giving the opposition movement its biggest electoral victories to that point: 35 percent of the Provincial Assembly seats and 20 percent of the municipal executiveships. Since 1977, the KMT has been more cautious about using the "paratrooper" strategy.[21]

In theory, at least, party primaries offer a democratic alternative to nominations decided in smoke-filled rooms by party honchos and local bosses. From 1983 to 1989, the party simply canvassed local cadres for their views; in 1989 this process was institutionalized as a primary election. But the design of the primary reflects the party's ambivalence. To date, the KMT has held two-stage primaries. In the first phase, the rank and file vote for their preferred nominees. The second phase gives local cadres a chance to express their views of the candidates under consideration. In 1991, the party gave a 60 percent weighting to the first phase, and 40 percent to the second. To avoid an over-reliance on primaries, the party adjusted its weighting to 50-50 in 1992. Once the locals have expressed their views, the party center studies the correctness and feasibility of the outcome, occasionally overruling primary results.

Using party primaries created its own set of problems. First, primary results tend not to reflect local party members' true preferences. Special party constituencies — especially military voters and retired servicemen — have proven to be better organized and more motivated to participate in the primaries than ordinary party members and local factions. And as one newspaper observed, "Winning a large bloc of votes in the primary in neighborhoods peopled by retired servicemen will not necessarily assure a victory in the December election" (*China News* 8/20/91). Because of the composition of primary voters, conservatives and Mainlanders frequently are over represented in the nominations lists returned by the local party branches. But if party leaders amend the primary results to reflect a broader cross-section of the party, they lay themselves open to charges of manipulating the results and defeating the purpose of the primary election. After the 1991 primary, New KMT Alliance leader Li Sheng-feng complained that "[f]ew KMT members will be interested in primaries if they find that their opinions are not respected" (*China News* 8/22/91).

This conundrum is recapitulated in the general election. If primary winners are more conservative than other KMT members, they are even more so in relation to the

---

21 That is not to say the KMT has given up on paratroopers altogether. In the 1989 county executive elections, for example, Hsinchu City mayoral candidate T'ung Sheng-nan and the Taipei County executive nominee Li Hsi-k'un both fit the definition of "paratroopers." Their fortunes demonstrate the rewards and risks of the paratrooper strategy. T'ung defeated his opponents handily and has proven quite successful, while Li lost his race because of resistance from local faction bosses (see Rigger 1992).

median general election voter. In some cases, KMT primaries have returned slates which were virtually unelectable. In these situations, the party leadership has little choice but to overrule the primary result. But each time the party ignores or rejects primary results it undermines the legitimacy of the primary system and increases party members' cynicism. Indeed, the way the KMT leadership uses primaries has come to seem quite arbitrary. Said ROC political scientist Lu Ya-li, "Primaries in Taiwan are not a democratic procedure ... But they are a kind of legitimating process; if not nominated by primaries, the loser can't claim they are being discriminated against" (quoted in *Far Eastern Economic Review* 10/1/92:14). According to Kuan Chung, who presided over the first party primaries in 1989, the KMT's use of these elections is unacceptable: "if the KMT does not pursue complete democratization immediately, the DPP will replace the KMT as the ruling party" (*Free China Review* 3/93:61-62).

In 1991, KMT nominations struck a balance between placating local factions and promoting "good government" candidates. Especially in the urban areas, the party promoted scholars with expertise in constitutional law. But in 1992, the party's emphasis was clearly on selecting candidates who would win. Chu Kao-cheng expressed a complaint repeated frequently in news reports when he said, "The standard used by the heads of the KMT's local branches to nominate its members as candidates was based on their potential to be elected rather than their previous parliamentary performance. To put it more directly, it was considered more important to have local faction connections and support or the ability to buy votes" (*Free China Review* 3/93:68). In the absence of a strong party center, this emphasis on local factions encouraged candidates to run their campaigns independently, ignoring or even defying party efforts to coordinate the campaign.[22]

ROC scholars recognized this trend even before the 1992 elections. For example, in the late 1980s, Lui Fei-lung wrote:

> The responsibility zone system, which the KMT has effectively used as a mobilizing mechanism in elections for many years, is basically a tool pulling the strings of the primary social relations of the candidate, his assistants, and the KMT leaders. It would be totally useless if there were no primary relations in the 'zone' to be mobilized. However, although this strategy has proven successful in winning elections, it has also fostered a tendency in candidates toward self-reliance. By self-reliance, we mean that if a candidate has to use his own primary relationships to build up a campaign network strong enough to win the

---

22 In interviews, and also in some documentary sources, opposition supporters argued that the KMT's electoral fortunes took a turn for the worse when Kuan Chung was the head of organization for the party in the late '80s. They claim he shifted the party from a organization-based strategy to a more election-based strategy emphasizing winning votes at all costs. In the process, they say, he plunged the party into an unhealthy dependence on vote buying and local factions. For an example of this view, see the article in *Tienhsia* magazine (8/1/92) translated in JPRS 9/23/92. I believe this theory makes a scapegoat of Kuan, while underestimating the importance of increased competition in driving the KMT to adopt a vote-based strategy. It also ignores the long-term links between the KMT and local factions. However, it would be interesting to pursue the question of how much of the party's current predicament can be laid at the feet of bad tactical decisions by Kuan and others.

> election with or without the help of local KMT leaders in the responsibility zone, he will be more independent in his political behavior afterward. This is why KMT members in the representative bodies tend to be more independent and party influence seems to be diminishing (Lui 1991:163).

The forces Lui identifies in this passage came to fruition in 1992, when the KMT was no longer able to make a credible threat of punishment against unruly candidates (Chen Che-nan, expelled from the party for his sympathetic views on Taiwan independence, won his race anyway) or to offer a credible promise that cooperation with party strategy would guarantee victory.

Reform Proposals and Future Elections

Institutional reforms introduced in the late 1980's and early '90's were an important reason for the declining effectiveness of Taiwan's clientele system. At the moment, the ROC government is considering several additional reform proposals which may further undermine the clientele system.

The SNTV Formula: In the summer of 1991, as the Legislative Yuan was considering rule changes for the National Assembly election, the DPP proposed a modification to the SNTV formula. In place of the single vote system, the opposition party proposed giving each voter two votes, one for a party and one for a specific candidate. The percentage of party votes each party won would determine its share of at-large and overseas seats. The motivation for the proposal was political. The DPP recognized that most voters select candidates for personal reasons, not because they identify with a particular party. So as long as the clientele system is working effectively, some voters who might prefer the DPP as a party will continue to vote for KMT candidates for clientelistic reasons. A two-vote system would allow these voters to express their preference for the DPP in their party votes, but without forcing them to abandon their commitment to particular KMT candidates supported by their clientele networks. The DPP would gain extra at-large seats, and it would also be able to demonstrate wider popularity than ever before.

The KMT preferred to divvy up the extra seats according to the proportion of seats each party won in the geographic districts. This way, the KMT could make the most, not only of its vote share, but of its seat bonus as well. Faced with the DPP's two-vote counter-proposal, the ruling party offered a compromise, agreeing to take both votes and seats into account. The DPP stuck to its position, forcing the KMT to make the further concession of dividing the seats based on vote share only before it could settle the issue. Even so, the opposition put up a strong fight for the two-vote proposal, backing down only after some fancy political footwork by the KMT's legislative leadership.

The KMT's justification for rejecting the DPP's two-vote proposal was that the opposition party was trying to sneak a referendum on Taiwan independence and KMT leadership into the National Assembly election. But after its embarrassing showing in the 1992 election, many Taiwanese began to doubt the ruling party's popularity. With the shoe suddenly on the other foot, the KMT revived the two-vote proposal, and Interior Minister Wu Po-hsiung placed it before the Legislative Yuan for consideration. The reason for the

party's change of heart is almost certainly a desire to force the issue of party identification at a time when the party seems in danger of splintering. If the two-vote proposal passes, it will increase the salience of party labels in elections by forcing voters to form and express a party preference. More party-oriented voting would not put an end to the clientele system — the problem of which *candidate* to choose would remain — but it might nudge voters to bring their two votes into harmony, thereby solidifying each party's base and promoting party identification.[23]

Another proposed alteration in the SNTV system would reduce the percentage of the vote required to appoint at-large and overseas representatives from five percent to three percent. Currently, only parties which receive at least five percent of the votes cast are eligible to select at-large and overseas members. In practice, this means the KMT and DPP. Thus, the smaller parties end up with even less of a share in power than the voters awarded them at the polls. Prominent politicians outside the major parties — including DPP dropouts Lin Cheng-chieh and Chu Kao-cheng — are leading the fight for a lower threshold. Lu Mei-wen, a leader of the Workers' Party, accused the two main parties of colluding to keep out competitors; he said their disputes are nothing more than "two rich people fighting with each other for more money" (*China News* 7/16/91). In theory, reducing the quota to three percent would encourage the growth of "third parties"; in reality, it is not likely to have much effect. A more radical move would be to eliminate these seats altogether, but the at-large and overseas seats benefit both major parties, leaving little support in the legislature for their abolition.

Campaign Rules: The Central Election Commission recently submitted a proposal to the Executive Yuan to allow individual candidates to buy television and radio advertising. Again, this is an appealing idea in theory, but the reality of the situation is that few candidates are likely to be able to afford TV. Also, television is an extraordinarily inefficient way to reach out to voters. Taiwan's three TV stations all broadcast to the entire island, so a candidate's constituency comprises only a small fraction of the potential viewing audience. TV advertising would be viable only in an island-wide election, such as a presidential or provincial governor's election, or if additional broadcast channels are opened to allow for local television stations. Despite constant complaints from the political opposition, it is unlikely that the ban on new TV stations will be lifted soon.

Radio, which is included in the Election Commission's proposal, is a more promising medium for political advertising. In January 1993 the ROC opened 28 FM radio frequencies. The new stations will be regional, so candidates will be able to target commercial broadcasts to their districts. Radio advertising is cheaper than television commercials, and it also is less regulated. There is more Taiwanese-language programming on radio than on TV, making it a natural forum for election-related appeals, since most candidates campaign almost entirely in Taiwanese. In the most recent elections, illegal cable TV networks broadcast political advertising, but to a limited audience. The so-called "Fourth Channel" accepted advertisements from KMT candidates, while the

---

[23] Some scholars, including Yang T'ai-shuenn and Hsieh Fu-sen of Chengchih University have suggested that the ROC scrap the SNTV system altogether. Such a move is unlikely in the near future, though.

opposition-linked "Democracy Channel" mainly promoted DPP nominees. If cable is deregulated, it could become a medium for mass-market campaigning.

Direct Election of the President: With both the public and President Lee Teng-hui firmly behind the idea, there is a strong possibility the National Assembly will amend the constitution to allow for direct election of the president when it reconvenes in 1995. In any case, direct elections for the mayors of Taipei and Kaohsiung Cities and the provincial governor already are scheduled for 1994. Undoubtedly, these large-scale elections will affect the clientele system, because for the first time, candidates will have to compete for votes across county lines. The clientele system described above evolved in response to an electoral system in which candidates never needed to campaign outside their home counties. Local factions are an artifact of truly local elections. Thus, the island-wide elections scheduled for 1994 present local factions with an unprecedented challenge.

Mobilizing clientele systems behind party candidates is a basic strategy of KMT activists and officials in Taiwan's municipalities; they are not likely to alter this approach for the 1994 races. But how well the system will function in these large-scale contests is another question. Although *tiau-a-ka* probably will be mobilized behind the KMT's presidential candidate (and *tiau-a-ka* in DPP-affiliated factions behind that party's nominee), the factors that normally motivate voters to comply with the *tiau-a-kas'* instructions will be absent. Confusion in the face of a long ballot will not be a problem since the number of candidates will be small (one or two candidates from each of the major parties, plus minor candidates) and there will be no doubt as to the significance of the election. These contests are sure to receive intense publicity, so information about the candidates' qualifications and positions on the issues will be accessible to voters without the intervention of *tiau-a-ka*.

Moreover, few voters will be able to claim personal ties to the candidates, and *tiau-a-ka* are unlikely to be able to make credible promises of preferential treatment. The only sources of clientelistic leverage that remain are personal obligation to the *tiau-a-ka*, which has proven to be of limited use in recent elections, and vote buying, which would be both prohibitively expensive and prohibitively risky (after 1992, anti-vote buying sentiment is too much in vogue for a presidential candidate to risk being sullied by corruption).

Even if the local factions could influence voting patterns in island-wide elections, it is doubtful that they will exert themselves in an election in which they have so little at stake. Local factions rarely take sides in the national-level KMT factional conflict. Those local faction-backed legislators who do belong to national factions are nearly all linked to the pro-Lee Teng-hui Mainstream faction. The New KMT Alliance and other Non-mainstream groups have their roots among Mainlander and military voters, who traditionally shun local factions. As a result, even if more than one KMT candidate joins the gubernatorial race (or a future presidential race), both local factions in most municipalities will end up on the same side. Judging from past experience, the factions are unlikely to use their own resources in a race which holds no comparative local advantage.

Although the clientele system is unlikely to be decisive in large-scale races, especially for provincial governor and president, there is no reason to predict that its impotence in these races will undermine its effectiveness in other contests, at least in the short run. The long-term consequences of island-wide elections are most likely to take the form of increased enthusiasm for issue-based and party-oriented voting, as citizens come

to appreciate the potential of voting as a tool for selecting officials at the highest levels and for influencing national policies.

Presidential versus Parliamentary Government: One of the most fundamental questions facing Taiwan's constitutional reformers is deciding whether the ROC should adopt a presidential or a parliamentary system. At the moment, the ROC constitution provides for a mixture of the two; it defines roles for both a president and a prime minister (premier). Which of the two offices is more important depends more on the individuals occupying them than on a constitutional division of authority. For example, when Chiang Ching-kuo was premier under president Yen Chia-kan, the premiership was the more influential post. But after Chiang ascended to the presidency, the office of premier lost much of its power. For a time, when Lee Teng-hui was president and Hau Pei-tsun premier, the balance of power between the two offices was unclear. Now, with Hau out of office and Lee's nominee, Lien Chan, in charge at the Executive Yuan, presidentialism has re-emerged.

One of three alternatives is likely to emerge from the current discussions on constitutional reform: a true presidential system, a true parliamentary system or a variation on the current, mixed system. Each of these choices would have consequences for the electoral system. For example, a presidential system — in which a popularly-elected president holds full executive power — would emphasize party-to-party, island-wide elections. As noted above, presidential elections are less conducive than legislative elections to clientelistic mobilization. Instead, they encourage voters to focus their attention on party identification and issues.

In contrast, a parliamentary system — in which a prime minister chosen by the party holding a majority in the legislature holds executive power — would allow Taiwan to continue choosing its national leaders without holding truly national elections. Parliamentary elections in Taiwan are precisely as political scientist Chu Yun-han described them when he said of the 1992 election, "This is not a national election, it's 25 concurrent local elections" (quoted in *Far Eastern Economic Review* 12/18/92). Thus, a parliamentary system would leave local elections more or less as they are, while a presidential system would create a new category of national election in which clientelistic mobilization would be ineffective.

Japan's experience is instructive here, because Japan's formal institutions, including a true parliamentary system, coexist with an informal clientele system based on candidate-centered campaign organizations (*koenkai*) and factions. One of the reasons the LDP remained in power for so many years is that the parliamentary system allowed the ruling party to avoid a national "referendum" on its leadership. Like Taiwanese legislators, Japanese Diet members are the highest popularly-elected officials in the Japanese government, yet they are chosen in essentially local races. Elections rarely carry coherent national mandates, because there are many districts, and voters in each of them must take into account local as well as national concerns. The import of Japanese Diet elections is further clouded by the fragmentation of the opposition, which has thus far prevented a consensus from emerging as to what constitutes the best alternative to the LDP. Even the ballyhooed 1993 Diet election fits this pattern. The "defeat" of the LDP did not occur because voters rejected incumbent LDP Diet members in favor of representatives from other parties; rather, the key players all were former LDP members who were re-elected

to the Diet as representatives of splinter parties. What brought down the ruling party were LDP Diet members defecting from their party, not LDP voters defecting from their Diet members.

A second implication of Japan's parliamentary system for the Taiwan case is its tendency to promote electoral factions that extend beyond individual election districts. If Taiwan were to adopt a true parliamentary system, in which the prime minister and cabinet would be drawn from the majority party, local factions might well begin to link arms across county lines to form national-level electoral factions. This would be a significant alteration in the system of clientelistic mobilization. Judging from the current debate, however, Taiwan will most likely adopt the third alternative: a combination of a strengthened presidential system with some aspects of parliamentary government.

Local Autonomy: Traditionally, local governments in Taiwan depended on provincial and national sources of revenue for half of their budgets or more. Often, localities haven't enough money to carry out their basic responsibilities, much less to implement discretionary programs. The legislature currently is considering a bill to ameliorate some of the worst problems in local government finance by permitting local governments to develop new revenue sources. Under the proposal, localities could levy new taxes and issue bonds. It is difficult to predict how this measure will effect the operation of the electoral mobilization system. By giving local governments the resources to formulate and implement policy independently, the bill could increase the salience of issues in local contests, undermining clientelistic mobilization. What is more likely, however, is that giving local governments more money will reinforce the clientele system by enlarging local factions' resource base.

Party System: Taiwan's party system is likely to change significantly over the next few years, in at least two respects. First, power within the KMT, which up to now has been highly centralized, is shifting to the local level, giving local factions and rank and file members a more autonomous role in decision-making on electoral matters. Second, it is possible that one or both of the major parties will split. Since the beginning of the reform era, KMT leaders' control over party members and candidates has diminished markedly. The devolution of party power reached its peak (or, perhaps its nadir) in 1992, when more than a quarter of the KMT members who took part in the election ran without the party's nomination or endorsement, and the party center was powerless to stop them. Jaw Shaw-kong and Wang Chien-hsien derailed the party electoral strategy in two key districts, yet KMT leaders did little to prevent their entering the race. Other candidates refused to support the party platform; some even campaigned against it. For example, Taipei County legislative candidate Wu Tzu's campaign slogan was "The pawn crosses the river to check the general; Wu Tzu fights a major war with [Premier] Hau Pei-tsun."

Proposals currently under consideration by the party would formalize the transfer of power from the party center to the local rank and file. At its August 1993 congress the KMT will likely allow the direct election of the party chair by the delegates (rather than a select committee). The 1988 party congress passed several guidelines for party reform, including a provision calling for the demotion of the special party branches to the level of party caucuses. If the proposal goes into effect, special branch members will have to transfer to local (geographically defined) party headquarters. The special branches have long served as a direct link between the center and groups of voters, bypassing local

factions and bosses. If these branches are disbanded, the party will lose this link. The guidelines also called for doubling party membership and reorganizing the party on the basis of branches rather than cells. Both these actions would emphasize electoral success at the expense of Leninist discipline.

Still more changes in the party system can be expected if the party adopts current proposals to limit its privileges. A bill before the legislature would divest the KMT of its profit-making enterprises. The measure would help level the playing field for opposition parties, and also would shift even more of the financial burden of political campaigns onto the candidates themselves, reducing the party's leverage over candidates and *tiau-a-ka*. The party already has promised make its operations more transparent by registering as a legal entity. Registration is similar to incorporation, and would consolidate the party's scattered assets under a single entity. The move also would open the party to government oversight.

Taiwan's political parties are preoccupied almost to the point of obsession with the threat of disunity. Until 1992, most speculation about party disintegration focused on the DPP, but recently the KMT seems at least as imperiled. KMT members of the Legislative Yuan are divided among four tendencies: the New KMT Alliance (NKA), the Wisdom Coalition (*jisi hui*), the Kao Yu-jen faction and the unaffiliated legislators. Two of these factions, the NKA and the Wisdom Coalition, already have registered as political groups within the KMT, raising grave concerns among party leaders, who in both cases expressed the fear that registration constituted a first step toward forming independent parties. According to NKA leader Jaw Shaw-kong, his intention is not to split the party, but to pressure the KMT leadership to acknowledge the diversity of views within its ranks and to allow genuine intraparty democracy (*Kuang-chiao Ching*, trans. JPRS-CAR-93-030, 5/12/93:39). Nonetheless, some NKA staffers began the process of forming a party when the KMT Central Standing Committee approved a proposal to give legislators more seats at the party's 14th congress, scheduled for August 1993. The NKA objected to the decision, which it claimed was an attempt by Lee Teng-hui's supporters to stack the meeting to ensure his re-election as party chair.

At this point, a split in either major party would alter the distribution of political and economic resources in Taiwan, and undermine the divided party's ability to use the mobilization system effectively. The SNTV formula rewards large, well-organized groups, so dividing a party invariably hampers its ability to make optimal use of its resources. The KMT derives much of its comparative advantage from its ability to use the mobilization system. Were the party to split, this advantage would diminish. For example, the most likely line of cleavage for a KMT split is the line between the Mainstream group, which is linked to the local factions, and the Non-mainstream group, which has ties to military voters and retired servicemen. If the two were to permanently divide their vote bases, there would be no chance of redistributing votes from military candidates to faction-supported candidates and vice versa. Neither group would be able to maximize its electoral resources. Based on past elections, the Non-mainstream group probably would have more than enough votes to elect one or two candidates in each district, but too few to elect more. Once it severed its ties with the KMT, it would be forced to choose between wasting votes through under nomination and risking defeat through over

nomination. As it is now, the Non-mainstream's "extra" votes are a source of leverage and power within the party.

Conclusion

Taiwan's clientele system is an important part of the KMT's strategy for retaining its dominant position in ROC electoral politics. But the system itself developed within a specific institutional environment. The SNTV formula, restrictive campaign rules, the new party ban and other formal institutions made it possible for candidates to negotiate a division of turf and to mobilize voters through personalistic networks. But the process of democratization inevitably will dismantle the formal rules which sustain the clientele system. As the rules change, politicians will be forced to adjust their behavior to the new environment in which they find themselves. Perhaps they will be able to fine tune the clientele system so that it can continue to produce results for them even in a more democratic Taiwan. The 1991 election results suggest that at least under certain conditions, the ruling party can still use the system to win a large majority. But the possibility also exists that Taiwan's formal post-reform institutions will prove incompatible with clientelistic politics. In that case, the clientele system will disintegrate.

REFERENCES, 20

This paper is a revision of part of a longer essay, *Bureaucracy: A Profound Puzzle for Presidentialism,* which deals with the cross-pressures faced by all presidentialist regimes as they handicap them in their efforts to control their bureaucracies. They face the paradoxical dilemma that their survival requires effective administrative performance but a bureaucracy powerful enough to administer well is also able to overthrow the regime whenever it cannot cope adequately with severe crises. The American case is exceptional among such regimes for several reasons, notably its federal structure, its extraordinary reliance on private organizations to implement many public functions, its continued use of in-and-outers in government service, and the professionalization of its bureaucracy. Combined, these features facilitate a high level of administrative performance in dispersed niches, and weaken the bureaucracy enough so that it cannot stage a coup and exercise political domination. The excerpt used here has been revised to meet the needs of a mini-conference on **Professionalism in the U.S. Bureaucracy** to be held on September 1, 1993, just before the opening of the American Political Science Association's convention in Washington, D.C.

This preliminary draft is **not for publication or quotation** *without the author's permission. Please send comments and suggestions to him at:*

February 1993

Bureaucratic professionalism in the U.S., including many of the problems and immediate consequences associated with it, have been well described by various authors (Rourke 1992; Cigler 1990; Wilson 1989; Willbern 1954; Kearney and Sinha, 1988). The subject deserves further analysis, in a comparativist and historical perspective. Such analysis would shed further light on the long-term causes which have resulted in the pervasive influence of professionals in the U.S. bureaucracy, and some of the far-reaching consequences of this development. More specifically, I believe that this phenomenon contributes significantly to the political weakening of the U.S. bureaucracy and, consequently, the long-term survival of a type of regime which, elsewhere, has been universally vulnerable to coups and the conquest of power by appointed public officials. It has also, exceptionally, motivated the rise of Public Administration as a field of research and teaching, while contributing to the identity and intellectual crises of this field. An understanding of the causes and consequences of bureaucratic professionalism in the U.S. will, therefore, help us bridge the gulf which has arisen between the study of politics and public administration in the U.S., and also help close the gap which separates the study of American government from the study of politics and administration in other countries. These results should interest both comparativists and Americanists, leading to findings of genuine long-term significance. A relatively short section discussing the historical causes of American bureaucratic professionalism will be followed by four sections examining its consequences, both positive and negative, intrinsic and extrinsic.

1. THE RISE OF PROFESSIONALISM

When Andrew Jackson became President in 1829 he found a host of retainers in office.[1] White (1951) tells us that "The spirit of the Federalist system favored continuity of service from the highest to the lowest levels... No property right in office was ever established or seriously advocated, but permanent and continued employment during good behavior was taken for granted" (p. 369). The rotation system changed all of that: it was established during the Jacksonian period. White (1954) reports that President Andrew Jackson (1829-37) "did not introduce the spoils system," but he did "introduce *rotation* into the federal system..." (pp. 4-5).

We normally associate the Jacksonian era with the rise of the spoils system, but it was the introduction of **rotation** that, historically, encouraged the routinization (bureaucratization) of the public services, and paved the way for bureaucratic professionalization.[2] How radical the Jacksonian transformation was for all later American Presidents (plus American governors and mayors) becomes apparent only in a comparativist perspective: in other presidentialist regimes, the **retention** of incumbents has remained the norm, despite the ability of successive Presidents to make new appointments. They typically displace and anger incumbents but do not replace them.[3]

1.1. Rotationism. The immediate cause of the Jacksonian "revolution" was the access to power of a populist President riding the wave of a substantial expansion in the electorate, both geographically and socially.[4] No doubt the tremendous surge of populist support for Jackson, as a vigorous man of the people, also empowered him to attack existing office holders who were widely unpopular as upper class elitists--indeed, most of them were *gentlemen*, i.e. men of property and education. Rotation was also facilitated by the many attractive opportunities offered by the growing private sector and the new settlement opportunities found within a rapidly expanding geographic frontier. Whatever the reasons, the principle of **rotationism** soon became well established and enabled American presidentialism to abort the development of a retainer bureaucracy that would have become powerful enough to jeopardize its survival.

Retainer power evolves gradually but inexorably. Holdover officials--especially if they have been downgraded by new patronage appointees--are peculiarly vulnerable to "corrupting" influences.

Having lost status and income, they are easily moved to establish self-protective networks (whether as "informal organizations" or "formal unions"). Moreover, they form unethical alliances with private interests and political parties and use these connections both to enhance their influence in the Congress and to secure benefits for their clients.[5] So long as retainers can prevent rotation, they can also block the introduction of a merit system: both are viewed as threats to their own job security. Perhaps above all, when the political (constitutive) system fails to govern acceptably, angry retainers can use their established networks to mobilize support for a military coup group conspiring to overthrow the regime.

1.2. The Reform Movement. By contrast, transients subject to rotation cannot form long-term alliances with outsiders or members of congress. They have little to lose by the introduction of a merit system and they might even hope that their experience would qualify them for re-entry into the government's new career system. The growing public anger at bureaucratic corruption and inefficiency that drove the American reformers, after a long and bitter political struggle, to secure the adoption of the Pendleton Act in 1883 was made possible, I believe, by the absence of significant bureaucratic resistance.[6]

The highly partisan rotation policy, therefore, paved the way for the civil service reform movement by degrading the quality of public administration so much that widespread popular dissatisfaction made reform a major political issue. "For more than thirty years," Van Riper (1958) tells us, the introduction of the merit system was viewed as "the most essential governmental reform" (p. 83). A widespread perception of abuse was expressed, typically, by an observer who wrote in 1841 that "...performance of official duty was far less requisite to a tenure of office than electioneering services. Hence the offices had become for the most part filled with brawling offensive political partisans of a very low moral standard--their official duties performed by substitutes, or not performed at all" (White, 1954, p. 310).

1.3. Non-Partisan Careers. The provisions of the Pendleton Act that resulted from the reform movement actually laid the foundations for a truly unique type of career system. Most notably, it made tenure in office conditional on a "non-political" (i.e. non-partisan) pledge. Remember that partisan transients typically received their appointments as a reward for services performed during previous campaigns--to remain in office they were often, if not normally, constrained to support future campaigns, not only as activists but also by paying assessments (White, 1954, pp. 332-343). Now, career officials would be immune from pressure to support party campaigns, either financially or by partisan services--a right most careerists were eager to protect.[7]

This stipulation reflected the reality that, to gain political support for the establishment of a merit system, it was necessary to insist that all careerists refrain from supporting any political party.[8] The notion both reflected and promoted the myth of a **dichotomy** between politics and administration: the evils of the rotation system were attributed to "politics," and the proposed career service was seen as a "non-political" device.

The reform effort could scarcely have succeeded, therefore, without widespread acceptance of the idea that public administration could be separated from (party) politics--i.e. that career officials could be isolated from political parties and would not become activists in partisan campaigning.[9] Although the dichotomy myth was born of political expediency, it has come to be accepted as both a normative and empirical truth. Some of its far-reaching implications for bureaucratic politics and the study of Public Administration are discussed below--see section 6.

Although the "classified services" established under the Pendleton Act continued to grow at the expense of positions reserved for "political appointees," the system of rotation in office remained entrenched and several thousand new appointees are still named by each incoming President.[10] Rotation and careerism have, therefore, co-existed in an uneasy and often embattled relationship to the present day.[11] In order to evaluate the significance and interdependence of careerists and transients in American government we need to understand that these careerists are all *functionaries*

rather than *mandarins*, and that the necessary role of mandarins has to be played, however imperfectly, by transient political appointees.

1.4. Functionism. The underlying dynamics for the rise of professionalism in the American bureaucracy may be attributed, quite unintentionally, to several stipulations in the Pendleton Act that made functionism the norm. Most importantly, it stipulated that the exams should be *practical*, a provision with far-reaching implications. It also rejected the notion that only young people should be recruited for entry-level tenured careers; rather, *positions* were to be *open* and available to qualified candidates, regardless of age. Finally, recruitment was to be *apportioned* on the basis of population so that candidates from all the states would have equal opportunities for government jobs.[12] A completely new kind of career system evolved, exceptionally, in the U.S. as a result of these specifications.

To understand how exceptional the American system was, we need to be clear about the properties of the classical *mandarin* system manifested in the original Chinese model, as it was adapted to the needs of the Indian Civil Service and the British Administrative Class.[13] It was the starting point for the debates that led to the Pendleton Act but resulted in a very different kind of bureaucratic system. A mandarinate is recruited by *academic*, not practical exams; recruitment is *closed*, not open; and it leads to a *status*, not a position-based career system. Put differently, academic exams (philosophical, literary, historical, mathematical, etc.) paved the way for young university graduates to enter a generalist career service in which personal rank, not positions to be filled, is emphasized.[14]

A generalist mandarin class or cadre has two properties of fundamental importance: first, it is **powerful**, and second it can **coordinate** programs at a macro-policy level. Its members identify themselves with the bureaucracy as their primary frame of reference and source of self-esteem. Consequently, mandarins easily establish close bonds or intra-bureaucratic networks that enhance their power position. They lack "professional standing" in the sense that they do not have university degrees in a particular field of expertise such as medicine, law, education, or agriculture. However, their experience (rather than their university training) gives them genuine managerial competence and an ability to look at the overall needs of a government. They understand how diverse and often competing programs can be coordinated, and they can achieve administative excellence without formal pre-entry training in Public Administration.

The provisions of the Pendleton Act precluded the development of a mandarinate in America. Instead, a highly diversified set of functionally specialized career officers came into being, each oriented to specific jobs, progam areas, policies, and ultimately, *professions*. A foundation had been laid by the Morrill Land-Grant College Act of 1862 that was intended to help finance institutions that would "teach agriculture and the mechanic arts" and enhance the opportunities of "...the industrial classes in the several pursuits and professions in life" (Edmund 1978, pp. 15-16). Apportionment among the states provided an impetus for the new land grant colleges to strengthen and develop their training programs so as to equip their graduates to take the "practical" civil service examinations. Strangely, a substantial and growing literature on the characteristics and problems of the professions pays little or no attention to the linkages between bureaucratic appointments and professional status--see Moore (1970) for a good example of this literature.

The traditional liberal arts colleges (especially the Ivy League schools) were effectively by-passed by the authorizing legislation, for both geographic and substantive reasons. The new state universities were able to strengthen their burgeoning professional schools by adding academic departments. They gradually evolved into great state universities, well equipped to train an increasingly professionalized career bureaucracy in the United States. The convergence of these factors produced a higher level of professionalism in the U.S. bureaucracy than any to be found in other countries, regardless of their constitutional design.[15]

2. CONSEQUENCES OF PROFESSIONALISM

Although the rise of a professionalized career bureaucracy was neither the intention nor the immediate result of the Pendleton Act, it was a long-term consequence. The practical exams were gradually transformed into tests of professional knowledge and capabilities. Open recruitment permitted experienced professionals, not only recent university graduates, to enter the public service, thereby facilitating the professionalization of the U.S. career bureaucracy. Initially, I believe, many professionals were reluctant to accept the controls imposed by a bureaucratic hierarchy, but eventually they found that they could influence administrative policies and they began to exert pressures through their own associations to create conditions favorable to their professional standards and norms, including the recognition of professional standing (degrees and certificates) as requirements for specific categories of bureaucratic posts (Willbern 1954, p. 15).

Bureaucratic professionalization has many important consequences that can be described systematically by reference to two variables: **positive/negative,** and **intrinsic/extrinsic.** By the first I refer to evaluation of the results as good or bad; and the second refers to the immediate or direct effects of something vs. the indirect or feed-back effects. Circular, not linear, causation is taken for granted in this discussion--if A causes B, it is assumed that by a feed-back effect, B also influences A. When circular causation has a negative effect, we often speak of it as a *vicious circle.* To refer to a positive effect, we may speak instead of a *benign circle.* Professionalism in the U.S. bureaucracy is implicated in both vicious and benign circles--actually, sets of linked or chained variables that typically involve many more than two basic nodes. One could discuss such interdependent nodes or relationships in any order and discover that no matter where one starts, every element eventually has an impact on every other. To simplify this analysis, however, I will look at the positive effects before the negative, and under each of these headings, the intrinsic before the extrinsic implications.

3. POSITIVE-INTRINSIC CONSEQUENCES

Bureaucratic professionalism has surely enhanced the level of administrative performance within specific niches. Engineers, for example, are qualified and motivated to perform well within the domain of their special competence. Their motives are complex, however. Although subject to hierarchic intra-bureaucratic and political constraints, they also respond to norms established by the professional associations in which they participate. No doubt their early socialization in professional schools lays the foundation for the sensitivity to professional norms that is reinforced throughout the life of a professional by continuous involvement in interest networks that link the schools with officials and private sector practitioners.[16]

Medical and legal associations are familiar to all, but parallel organizations can be found in every professional domain. All three branches of the presidentialist regime are also implicated insofar as professionalism has also penetrated both Congress and the Courts. By a feed-back effect, for example, court decisions affecting bureaucratic conduct and criteria, have increased the need for and influence of lawyers in many government agencies. Decisions affecting health benefits, safety standards, or environmental safeguards have similarly enhanced the role of physicians, engineers, and natural scientists. Increasingly complex fiscal, budgeting, accounting and auditing procedures and safeguards enhance the need for accountants, auditors and evaluation officers

A useful distinction is needed between *standing* and *standards.* Professional standing is acquired by certification upon completion of required training programs in a school, but professional standards become internalized as behavioral norms that are continuously reinforced by associates and reference groups. By stressing "practical" tests, the Pendleton Act enabled professional **standing** to become, gradually, a major criteron or prerequisite for personnel recruitment. As a result, professional **standards** (often in conflict with each other as well as with governmental rules and political goals) have become the basic guidelines for administrative performance by innumerable American career officials (Wilson 1989, pp. 60; Rourke 1992, p.8).[17]

4. POSITIVE-EXTRINSIC CONSEQUENCES

The prevalence of professional standards in American public administration has produced two important results: it has facilitated the survival of American presidentialism and it has motivated the rise of Public Administration in America.

4.1. Regime Survival. The first consequence was unintended and is still unmeasured: namely, a significant reduction in the power position of the American bureaucracy reduces the possibility of a *coup d'etat.* This can be explained as a feed-back effect of the provisions of the Pendleton Act. Most bureaucracies--whether anchored in a top echelon of mandarins or based on retainers--generate a powerful sense of intra-bureaucratic loyalty and identity. Of course, mandarins, like professionals, have standards, but these are *bureaucratic* standards--they relate to the *esprit de corps* or morale of officials as officials, and they reflect a strong sense of loyalty to the **state.**

The familiar term, *administrative state*, is quite appropriate when referring to mandarin-powered regimes and it helps us understand why notions of the *state* are so prevalent in most parliamentary systems. By contrast, I believe "administrative state" is a misleading term to characterize the United States regime. It might, more precisely, be called a **network state** whose infinitely coplex maze of interest networks orient themselves to the overlapping concerns not only of corporations, non-profit agencies and professional associations, but also the overlapping structures of central/state/local government and the diverse legislative/executive/judicial branches of governance and a host of autonomous boards, commissions and self-governing bodies.

As for presidentialist systems outside the U.S., bureaucratic solidarity assuredly evolves among retainers, but it becomes self-serving to the degree that status anxiety motivates the development of informal organizations or networks dedicated to the preservation of bureaucratic privileges and security. Intra-bureaucratic networks among retainers as well as among mandarins, however, can generate high levels of solidarity and power. To the degree that parliamentary regimes are politically effective, mandarin bureaucracies are unlikely to become disaffected enough to back coup attempts. Moreover, their experience and loyalty to the state enable them to administer effectively enough to permit the regime to implement its policies, thereby dissolving the motives for a revolt.

By contrast, presidentialist regimes often fail to agree on policies that confront their major problems effectively. This often produces major crises which lead a powerful bureaucracy to support a coup.[18] A vicious circle comes into effect: retainers, who lack the qualifications and standards needed to administer autonomously or well are, nevertheless, able to seize power. When the performance of the state falls, they easily become disaffected enough to resort to violence, and may therefore support a military coup.

The American exception reflects the fact that its professionalized bureaucrats lack the solidarity to support a military coup. Even when concentrated and focussed leadership joined with coherent government policies are not available, professionals in the buraucracy are able to carry out needed policies and programs within their niches, i.e., when these policies are compatible with the professional standards formulated by the associations in which they are active. Moreover, these associations link many American bureaucrats with private sector constituencies and the legislative committees (with their staffs) that form the broader **interest networks** in which they participate. The satisfactions experienced by professionals who are able to achieve their standards means that they do not want to seize power. Moreover, because of their semi-powered status in a highly fragmented bureaucracy, they could not succeed even if some of them wanted to support a coup attempt.

Moreover, functionaries, in ambivalent alliance with members of Congress and powerful lobbies, buttress the capacity of that overloaded body to handle a vast agenda of public policy issues and to

maintain its autonomy as a separate branch of government. Well entrenched professionals in the bureaucracy, working with supportive members of Congress and their own staff professionals, also cooperate to maintain the system of *senioritism* that helps incumbents win elections and retain cherished committee assignments (Riggs 1993a).

The resulting autonomy of government agencies permits different and even conflicting norms and policies to flourish and coexist. It enables a host of governmental functions to be implemented autonomously--they can survive successive elections regardless of which political party happens to be in power. The main functions of government have become self-perpetuating and they help the regime as a whole to work, even though successive Presidents rage against their inability to guide or coordinate a massive infrastructure of virtually independent bureaus.

4.2. Public Administration A second **positive-extrinsic** effect of bureaucratic professionalism involves the development of Public Administration as an academic field. Clearly, *Public Administation* was not a recognized profession nor were "practical" exams created to test administrative capabilities for almost half a century after the Pendleton Act. Gradually, however, the need for explicit training in Public Administration gained recognition, text-books were prepared and professional training in this area came into existence. A management exam was even established, for a time, for M.P.A. graduates. Although many professionals in the bureaucracy recognized the need for additional training and knowledge to help them administer more effectively, no *professional* role as a line administrator has evolved in the American bureaucracy. At best, some of the *staff* fields of Public Administration have gained such recognition--i.e., one can be a professional in personnel, budgeting, accounting and auditing, planning, or office management, but it is difficult to find positions ear-marked for "professionals" in general Public Administration.

A notable aspect of Public Administration as a field of teaching and research--if not as a *profession*--is its disposition to avoid **party politics**. This attitude is rooted in the Pendleton Act's stipulation that careerists should be non-partisan, neither supporting financially nor working in an electoral campaign. Actually, careerists were delighted with this stipulation which overcame an onerous burden that patronage appointees (both retainers and transients) had long carried. The dichotomy between **"politics"** (i.e. partisanship) and **administration** may have been an important consideration driving the reform effort, but I suspect that it was also a weighty consequence of the legislation.

The new training programs that arose chose to focus on preparing civil servants for entry to the non-partisan career services. Military officers already had their own training programs, including West Point and other military academies and staff colleges. Partisan appointees were typically politicos whose party services were being rewarded--professionally oriented training programs could scarcely reach them. Given these constraints, *Public Administration* evolved necessarily as a "non-political" (i.e. non-partisan) activity intended primarily for future and present civil servants. As a fragile new academic project, training in "Public Administration" could not survive bureaucratic opposition--quite the reverse, it needed (non-partisan) bureaucratic support in order to assure graduates of career appointments.

Under these conditions, the study of **government** as a unified focus of teaching and research became sub-divided into two contrasting and even antagonistic fields: Public Administration programs eschewed *"politics"*, turning to business management and all the social sciences except politics for inspiration, while Political Scientists systematically down-played *public administration* as either unworthy of serious study or even an essentially "non-political" activity (Waldo 1968, pp. 7-8).[19] The negative consequences of this orientation are discussed below in section 6.

5. NEGATIVE-INTRINSIC CONSEQUENCES

Professionalization produces American bureaucrats who cannot manage and coordinate programs that cut across the interests of many government agencies--turf warfare and intra-bureaucratic struggles are inescapable. Even within the same agency, when several different professional fields are involved, conflicts proliferate.

All presidentialist constitutions, by definition, generate an overriding problem of power dispersion in the bureaucracy by creating three centers of legitimacy (Executive, Legislative and Judicial) each of which impinges directly, and with conflicting normative and action implications, on the bureaucracy. The adoption by Congress, under the Pendleton Act, of a functionist mode for institutionalizing the career bureaucracy reinforced this divisive force, especially by paving the way for the emergence of bureaucratic professionalism, leading to the proliferation of powerful interest networks. When viewed from the perspective of would-be integrators who seek to reconcile divergent norms and overlapping jurisdictions, the combined pressures for the dispersal of power are overwhelming. Career officials, especially the professionals, build their own power base and often appropriate policy-making powers from Congress. Krislov and Rosenbloom (1981) tell us that "...the bureaucratic agency may actually organize a constituency in order to assure an adequate level of support for its activities... Policymaking is largely transferred from the elected branches of government to bureaucratic agencies" (pp. 82-3).[20]

In this context, predictably, successive American governments have struggled in vain to find a workable strategy for achieving coordination. As Seidman (1980) writes, "The quest for coordination is in many respects the twentieth-century equivalent of the medieval search for the philosopher's stone. If only we can find the right formula for coordination, we can reconcile the irreconcilable, harmonize competing and wholly divergent interests, overcome irrationalities in our government structures, and make hard policy choices to which no one will dissent" (p. 200). Willbern (1954), by contrast, has pointed out that at the inter-governmental level, professionals may well serve a positive coordinating function, helping to link activities that would otherwise remain uncoordinated (p. 17). Nevertheless, it has seemed unfortunate to many that the British model of a generalist administrative elite was not established in the 1880's. However, when the power potential of any mandarinate is understood, it becomes clear that if the U.S. had embraced that model, it would almost surely have succumbed to bureau power.

5.1. The Senior Executive Service. In the absence of any understanding of this relationship, it is not surprising that efforts were made from time to time to create an American mandarinate that could coordinate the far-flung and highly dispersed apparatus of governance in America. A project to establish a cadre of generalist civil servants became one of the strong recommendations of the second Hoover Commission in 1955. The proposal was long resisted by Congress, however. Its members saw that "...rotation of career administrators would break up long-standing and mutually profitable relationships between congressional subcommittees and career officials in the line agencies and bureaus of the executive branch" (Mackenzie 1981, p. 127). Resistance to a youthful British style class of future mandarins proved invincible.

A compromise was finally accepted in the form of a senior mandarinate to be created by recruiting established functionaries. After an intense struggle led by President Jimmie Carter, Congress endorsed the idea and the Senior Executive Service was established through the Civil Service Reform Act of 1987. So far, however, the SES has not displayed the properties of a genuine "mandarin" class nor become a cadre of "superbureaucrats" (Campbell and Szablowski 1979, p. 217).

The SES has not even impressed its incumbents as a highly prestigious or financially attractive career goal--something that would truly astonish anyone familiar with the power and high status of the "mandarins" in parliamentary regimes.[21] In both the Chinese and British prototypes, authentic

mandarins were recruited as young non-professionals and spent their entire careers as generalists--perhaps this is the only way a true mandarinate can be formed (Dogan 1975; p. 4).

In the American case, outstanding professionals who might have been recruited for the SES already had well established networks and standards that could not easily be reconciled with those of a mandarinate. The essential failure of the SES project, however, is fortunate for the survival of American presidentialism: a genuine mandarin system would have undermined the power positions of both the President and the Congress, creating a kind of "meritocracy" reminiscent of Plato's Guardians. Admittedly, this is a speculation since we have no example of a viable presidentialist regime with an established mandarinate of generalists, but the logic of the scenario seems pretty persuasive.[22]

5.2. The Patronage Alternative. By default, the best mechanism available to an American President to try to coordinate the host of competing professionalized bureaucratic agencies is to rely on patronage appointments. Unfortunately, perhaps because of the dichotomy myth and their preoccupation with careerists, students of American Public Administration have failed to pay serious attention both to the need for and the costs of employing a large number of transients as public administrators, including members of the Cabinet.

Political Scientists have, of course, studied this subject but in a political context that directs attention to the problems of the Presidency and Congress rather than the bureaucracy. The cabinet and the Office of the White House offer contemporary Presidents their main opportunity to create a governing apparatus that can modify the diverse priorities of professionals in the career bureaucracy so as to align them with the popular "mandate" given by the electorate. Traditionally, this was done by appointing **politicos**, persons without professional commitments of their own whose primary loyalty was to the President and policies endorsed by the winning party.

Increasingly, however, *amphibians* or *technopols* rather than politicos are employed to staff the Executive entourage or "sacerdotal collegium" (Newland 1987, pp. 49-52). The term, "amphibian," has been used to characterize in-and-outers who find themselves equally at home inside and outside the government service.[23] Typically, departmental secretaries and their assistants are broad gauge professionals whose personal networks reach extensively into the constituencies served by government departments and agencies. Instead of helping the President coordinate diverse overlapping programs and policies, I suspect that amphibians often share the professional standards and norms of career officers under their authority. By contrast, **cabinet** members in a parliamentary regime are primarily politicians without professional commitments. The fact that they must stand or fall as a collectivity provides an external sanction to reinforce their intention to coordinate diverse policy goals in the interest of the state.

Presidential **cabinet** members are subject to no such constraints. They stand or fall as individuals, each vulnerable separately to the President's preferences and their ability to command support from members of Congress, especially as expressed by relevant committees. Increasingly, the Executive Office of the President, rather than the Cabinet, has become the locus of political coordination in the American system. Ultimately, of course, the President must almost stand alone as the person finally responsible for coordinating the deeply dispersed structures of power (Newland 1987; Pfiffner 1987; Durant 1990; Moe 1991).[24]

Despite his vast patronage powers, American Presidents can never really dominate the careerists nor assure coordination among them. As Wamsley (1990) tells us: "The political appointee...does not stride in the door of the government organization as the powerful proconsul of an emperor but more like a tentative and lonely ambassador appointed to a beleaguered foreign outpost... Their fortunes lie more in the hands of Congress, particularly its committees and subcommittees, and of interest groups than the president or White House staff" (p. 136).

The proper role of transients (both politicos and amphibians) in the American government remains a lively theme of debate. Without them, the dispersed orientations of a professionalized and semi-powered bureaucracy would almost threaten anarchy. Although patronage appointees cannot truly coordinate or reconcile intra-bureaucratic conflicts, the problem would surely be much greater without them. They provide a completely inadequate solution to the problem of coordination, yet without them, mal-coordination would become so great a problem that it alone would threaten the collapse of the system--not because of a coup but rather simply from internecine strife.[25]

6. NEGATIVE-EXTRINSIC CONSEQUENCES.

Bureaucratic professionalism in the U.S. has reinforced the myth of a political/administrative dichotomy. The importance of the dichotomy myth as a reform slogan is familiar to all students of American Public Administration, and much has been written on the validity/invalidity of the dichotomy. However, its consequences need more careful analysis. The professionalization of the American bureaucracy which underpins its semi-powered status owes much to this myth. At least, it supplemented the other factors that can be attributed to the Pendleton Act, as explained in section 5.42/3.

Moreover, the separation of Public Administration as an academic field of study and teaching from the study of Politics can easily be attributed to the myth--see section 6.22. If careerists were to be "non-political" civil servants, it seemed to follow that they should study only non-political subjects such as those taught in all professional schools. When the project to establish professional schools of "Public Administration" emerged, it accepted the need for a non-political orientation.

Consequently, the phenomena that generated American Public Administration theory as a distinctive and important field of research and teaching also hampered the analysis of the power potential of appointed public officials. Had a Compative framework been used, students of American government would have noticed how exceptional its bureaucracy is. No doubt the parochialism of a mode of analysis that focussed attention exclusively on the truly unique situation in the U.S. hampered any serious effort to go beyond the stereotypes generated by the dichotomy myth.[26]

6.1. Bureaucratic Power. Quite clearly, all bureaucracies in democratic regimes are significantly more powerful than the *semi-powered* U.S. bureaucracy. Moreover, all the governments of the industrialized democracies are able to control and use powerful bureaucracies effectively for administrative purposes. The U.S. alone among presidentialist regimes has been able to avoid a regime break down--and it is the only such regime that has a semi-powered bureaucracy. Surely if, like them, it had a powerful bureaucracy, it would also have experienced one or more catastrophic breakdown during a time of major crisis.

Paradoxically, the relative lack of power of the American bureaucracy, and the continuity of the U.S. regime combined to render the idea of a **dichotomy** between politics and administration plausible. In other countries--and especially in (undemocratic) bureaucratic polities--appointed officials (military and civil) are powerful enough to block serious analysis of their operational methods and their characteristic pre-entry training requirements call for legal, humanistic, or even scientific education but not for a *professional* education in Public Adminjstration--unless, sad to say, the approach has been denatured by the omission of its political aspects.[27]

Bureaucratic professionalism, then, has been a major factor in the explanation of the relative weakness of American civil servants while also providing a context in which the creation of training programs for public administrators could flourish. Although "Public Administration" never gained full recognition as a a *profession* within the U.S. bureaucracy, it did acquire marginal respect both for its contributions to various career staff roles, and for its capacity to help line administrators enhance their own careers. These advantages have actually induced many contemporary American

administrators to support Public Administration as a useful and non-threatening activity. Their willingness to collaborate in organizations like ASPA and NAPA provides evidence of this attitude, by contrast with the situation in most other countries where public officials and academics teaching Public Administration typically distrust each other and avoid contact in such associations.

6.2. A Myth Perpetuated. This cooperative attitude facilitates Public Administration as an academic field provided--we may speculate--that the myth of a dichotomy between politics and administration is sustained. So long as serious inquiry into the phenomena of bureaucratic power is avoided, Public Administrationists are protected from threatening scrutiny by officials and the officials are not menaced by scholarly inquiry. As for American Political Scientists, who might have been expected to look critically at the power position of career officials, we find that they have largely ignored the subject. Perhaps this is so because they accept the myth uncritically or because their penchant for specialization has led them to focus on the components of constitutive systems and to relegate the study of bureaucracy to specialists in Public Administration.

Although the dichotomy myth still prevails in America, there are exceptions which deserve attention. For example Nachmias and Rosenbloom (1978) remark that "...all developed nations are thoroughly dependent upon a body of highly specialised and hierarchically organized administrators... ...bureaucrats have sometimes been considered a (new) ruling class" (p. 10). Heady (1991) has explained that "...comparative public administration is linked closely to the study of comparative politics, and must start from the base provided by recent and current developments in the comparative study of whole political systems" (p. 6). Scholars like these may eventually lead both Public Administrationists and Political Scientists in America to see how bureaucracy inescapably links politics and administration.

The dichotomy myth by itself, admittedly, would not have led to the emergence of Public Administration as an important focus of attention in America. Among the other contributing factors we must include the specifications of the Pendleton Act--practical exams; open recruitment for positions, not ranks; and apportionment among the states--all of which reinforced each other to generate the forces that led to the emergence of professionalism in general, and to the field of Public Administration as an unsuccessful candidate for professional status.

The negative aspect also needs to be recognized: careerism could never displace the need for transients as political appointees in the U.S. They scarcely recognize Public Administration as a relevant field for pre-entry training while Public Administration specialists tend to ignore transients as an irrelevant and undesirable remnant of the spoils era. Whenever Political Scientists study political appointees, they usually treat them in the context of the Presidential institution rather than of bureaucracy and public administration.

To summarize, an important negative-extrinsic consequence of professionalism in the U.S. bureaucracy involves its contribution to the rise of Public Administration as a specialized and very insular field rooted in the politics/administration dichotomy myth. The time has come, I believe, to transcend this limitation: comparative analysis can now reveal the highly political consequences of professionalized bureaucracy in the U.S.

7. CONCLUSIONS

Admittedly the propositions set forth above are speculative and ought not to be accepted as proven. Much more research is needed to establilsh their validity or substantiate alternative explanations. However, I believe the effort will be highly rewarding. Closer analysis of the political and administrative causes and consequences of professionalism in the U.S. bureaucracy will, assuredly, contribute to our understanding of both the **political** and the **administrative** aspects of American governance. Thereby, some of the damage caused by the dichotomy myth can be undone. The topic promises to build a bridge between Political Scientists who imagine that **bureaucacies** need not be studied because of their apolitical functions and Public

Administrationists who somehow think that they can understand governmental **management** without taking its political implications into account.

Moreover, this theme will help close the chasm that has arisen between students of **American** and **Comparative** Government. The extent to which professionalism in the U.S. bureaucracy is a truly unique phenomenon, both in its origins and its consequences, can surely be understood only by comparative analysis with the experience of many other countries. Consequently, further **research** on this topic will promote the study of comparative government and, thereby, shed more and more light on the unique features and problems of government in America.

We are only beginning to see the far-reaching implications of bureaucratic professionalism in the U.S. Although it is a topic of geat intrinsic interest, its further analysis promises far-reaching rewards that will fill important gaps which have seriously hampered our efforts to understand the dynamics of both American and foreign systems of government.

NOTES

1. Although *retainer* was traditionally used to mean a family servant, it has also been employed to mean "civil service retainers" (*W3*), and I shall use it only in this sense, to identify patronage (political) appointees who retain their posts indefinitely. The concept must be distinguished clearly from merit-based *careerists* whose tenure in office is assured by a legally binding contract with the state. Historically, a king's **retainers** became officials and the word was long used to refer to them. Although the word has fallen out of use in democratic regimes, I see no reason not to use it to refer to patronage appointees who retain their offices on a long-term basis.

2. Ironically, Jackson can be credited with the bureaucratization of the American public services, in addition to the rotation system. The two phenomena reinforced each other. Rotation made agencies more impersonal. They could no longer depend on the personal preferences and idiosyncracies of long-term patronage appointees. It became necessary, as an unintended result, to adopt formal rules and regulations (Crenson 1975, pp. 131-139). In this light, we should not equate bureaucracy with career services but, rather, with formal hierarchies of office governed by rules and regulations, regardless of how the offices are filled.

3. Although the Jacksonian revolution had far-reaching effects, we should not exaggerate its extent. Probably no more than 10% of incumbents (certainly less than 20%) were actually removed from office during the Jackson administration (White 1954, p. 308). Throughout the following decades, "a hard core of experienced men...remained steadily at work" despite "the clamor for removals and partisan appointments to resulting vacancies" (p. 349). In short, despite the conspicuous role played by transients, a substantial number of retainers were able to maintain the essential functions of public administration. After 1829, "Two personnel systems were thus in operation... The patronage [transient] system held the public attention, but it was primarily the career [retainer] system that enabled the government to maintain its armed forces, to collect its revenue, to operate its land system, to keep its accounts and audit its expenditures... The adjustment of the two systems remained even a century later an object of concern" (p. 362).

The reform movement was driven, of course, not only by the flagrant abuses of power indulged in by partisan transients, but also by the irresponsible behavior of many retainers. Although experienced and indispensable "workhorses" were often good public administrators, as White claimed, they were largely invisible and could scarcely protect the status quo from its critics.

4. It is easy today to lose sight of the tremendous political significance of the rotation system. No comparable transformation was ever imposed on any other retainer buraucracy in a presidentialist regime, so far as I can tell. It was possible in the U.S. for a variety of covergent reasons, including the following. The aggregate vote in the presidential election of 1824 was only 356,000; by 1836 it had risen to 1,500,000 and in 1849 to 2,400,000. Although population growth was undoubtedly a

factor, the major reason was the elimination of property restrictions, especially in the new Western states, and a growing interest in politics (Nevins and Commager 1956, p. 175). In his first annual message to Congress (December 1829) Jackson declared: "...more is lost by the long continuance of men in office than is generally to be gained by their experience... .where offices are created solely for the benefit of the people no one man has any more intrinsic right to official station than another" (Hofstadter 1954, p. 51). The successful establishment of rotation reflected the emergence of mass politics at an early period in U.S. history--by contrast, elsewhere, entrenched property rights and the seeming stability attributable to government by retainers has persisted until the present day.

5. In Brazil, where the retention of patronage-based offices prevails despite energetic reform projects, Mainwaring (1988) tells us that "The political class has been acutely aware of the overshadowing of the legislature by the bureaucracy and has responded by expanding their influence within the bureaucracy... [with] catastrophic consequences upon the efficacy of the state apparatus" (p. 24). Clearly, powerful networks composed of private interests, bureaucrats and political parties, working with legislators, are able to secure particularistic concessions for themselves. Although superficially similar to the "iron triangles" found in America, the pervasiveness of retainers makes these networks more amenable to particularistic interests and less likely to promote universalistic policies and programs. As triangles, they are "soft" (not iron) representing retainers rather than careerists, and rich families or corporations rather than functionally organized interest networks associated with large numbers of voters.

6. I can only hypothesize about this relationship because I cannot find concrete documentation for it. Van Riper (1958) emphasizes the importance of the civil service reform movement led by "...a small group of predominantly wealthy and politically conscious easterners with a philanthropic turn of mind, aided by an aroused public opinion" (p. 80). A more detailed profile of the reformers is given by Hoogenboom (1961) who writes: "...the civil service reform movement was essentially conservative. ...reformers wished to return to the good old days before Jacksonian democracy and the industrial revolution--days when men with their background, status, and education were the unquestioned leaders of society." They "attacked the hated spoilsman's conspicuous source of strength in the civil service" (p. 197). See also White (1958, pp. 278-302)

In the American case, transient spoilsmen could scarcely have organized enough political support to present any significant opposition to the reformers--they lacked the power that entrenched retainers could offer in other countries. Evidence of such resistance can be found in the many obstacles to post-war merit-system reform encountered by American and United Nations Public Administration advisers in Latin America (Ruffing-Hilliard 1991).

7. The Pendleton Act forbade career employees "to coerce the political action of any person" and penalties were prescribed for "political assessments of or by competitive employees, or by any other federal officials" (Van Riper 1958, p. 99). In 1939 and 1940, responding to President Franklin D. Roosevelt's efforts to discipline recalcitrant Democrats in Congress by means of patronage, the Hatch acts were enacted. The first act extended the prohibition against partisan activities to unclassified employees (except for those in top policy determining posts), and the second strengthened the terms of this prohibition by extending it to all state and local employees paid in full or in part by federal funds. Officials violating this proscription could be removed from office (Van Riper 1958, pp. 340-41). No doubt career officers were happy to comply with laws which enabled them to avoid onerous partisan tasks and financial assessments.

8. The provisions of the Pendleton act, perhaps unintentionally, were not hostile to the long-term interests of transient appointees. Some, already out of office, may have hoped to re-enter the public service as careerists, beneficiaries of the Act's open recruitment policy. Even transients, still in office but facing discharge because of rotation, may have supported merit system reforms in the hope that they could be "blanketed" into a position. The American "rank-on-the job" tradition--by contrast with the "rank-in-the-man" system prevalent in most parliamentary regimes--has enabled

some Presidents, almost clandestinely, to convert their transient appointees into retainers by "covering" their **positions** into a classified service. This probably could not have been done in any rank-in-the-man system where overt changes in personal **status** would have been far more conspicuous. Although transients in the bureaucracy could not exercise collective power, no doubt some of them individually supported the reform movement from which they may have hoped to benefit.

9. The nonpartisanship of American careerists may be contrasted with the bureaucratic partisanship typically found in other presidentialist regimes. Consider, for example, the situation in Chile where merit systems and partisanship have been commingled. According to Valenzuela, "The Chilean civil service was recruited and promoted through a Chilean version of the spoils system: party recommendations, and legislative support, in addition to formal credentials, were important in gaining entry and crucial in rising to higher office. The civil service was fragmented... by strong partisan loyalties that prevented the development of institutional loyalties" (Valenzuela 1984, p. 271).

Because of its American colonial heritage, the **Philippine** presidentialist regime has installed an examination based career system. However, according to Carino (1989) its "career" officials were often openly partisan. She reports, for example, that "...a third of middle-level bureaucrats in a survey mentioned helping in an electoral campaign--against civil service rules. Another third acknowledged nurturing political ambitions..." "Civil servants also sometimes played off the executive against Congress, claiming the ability to get appropriations despite the absence of the President's support" (pp. 12 and 14). In addition to the career officials, of course, there were always a substantial number of Presidentially appointed "...agency heads and such aides as could be justified as 'policy determining, highly technical or primarily confidential'" (p. 10).

This was the "normal" pattern of bureaucratic politics in the Philippines before the advent of the dictatorship of President Ferdinand Marcos in 1972. He sought to institutionalize an intermediate, highly politicized and well paid, layer of political appointees, the "Career Executive Service," to serve as the cadres of his authoritarian regime and to help him perform functions of the dissolved Congress. When President Corazon Aquino came to power in 1986 and sought to re-establish a democratic presidentialist regime, she imposed sweeping bureaucratic replacements, purges of many officials, and tumultuous reorganization schemes. The partisanship involved in this highly traumatic and often unsuccessful effort to "de-Marcosify" the bureaucracy are summarized in Carino (1989) and described in more detail in her earlier monograph (1988).

The Philippines and Chile are sometimes mentioned as good examples of presidentialist regimes (in addition to the U.S.) where the merit system has been successfully installed. Closer scrutiny suggests, however, that they have developed modernized retainer systems. Without the politics/administration dichotomy myth and strict enforcement of non-partisanship in its professionalized bureaucracy, the American regime might also have broken down, as all the other presidentialist regimes have.

10. In 1947, 92% of all federal bureaucrats in the continental U.S. were career officials--i.e. some 8% were political appointees. According to a recent report, there are now about 3,000 political appointees as compared with 2.1 million civilian federal employees--i.e. about 0.15% (Lynch 1991, p. 54). This transformation is remarkable: the overwhelming majority of appointed federal officials in the U.S. are now non-partisan careerists. Neverthelss, the patronage appointees, despite their small number, play politically and administratively essential roles that cannot be ignored.

11. The supporters of careerists in America are sometimes referred to as **bureauphiles** by contrast with their opponents, the **bureauphobes**, who favor transients in office. A bureauphobic call for more reliance on political appointees was issued by Lynch (1991), himself an experienced in-and-outer, when he complained that the Volcker Commission, "...has created an image of political appointees that seriously misunderstands modern government operations." Instead of cutting back

on political appointees, Lynch tells us, "...more responsive government today requires substantial increases in their numbers." He thinks that "...the executive should have enough political positions to provide adequate staff for its policy, public affairs, congressional affairs, general counsel and intergovernmental relations divisions... Responsive government requires a close link between the political ideas that win elections and the policies of government." Because the Volcker Commission sought to isolate "...government operations from winning political ideas," Lynch concludes, "those recommendations deserve to be shelved... ...they violate the most basic notions of democratic government" (pp. 54-5). Specialists in American Public Administration, he thinks, ignore this point of view at their peril.

A bureauphilic perspective is offered by Pfiffner (1987) who deplores "...the present trend toward increasing numbers of political appointees. Reversing this direction would increase the capacity of the government to function efficiently and effectively without sacrificing political accountability or responsiveness" (p. 64). Similarly, Dwight Waldo says that "...we are now witnessing a devaluation of neutral competence; some would say, a frontal attack on neutral competence. There has been a substantial invasion of political appointees, many of whom I judge to be willfully ignorant of government and woefully insensitive to public norms" (Brown 1986, p. 145). Neither the bureauphobes nor the bureauphiles seem to be aware of the constitutional causes and consequences of the phenomena they deplore.

12. Since apportionment opened the door for favorable treatment of applicants from all the states--a nineteenth century counterpart to contemporary "equal opportunity" rules--graduates of the new, widely dispersed land grant colleges where "practical" courses were taught became eligible for appointments, displacing graduates of the older liberal arts colleges. This laid the foundation for *professionalism* in the American bueaucracy, precluding the development of an American generalist cadre or mandarin system. Ex-transients, having been appointed for partisan reasons from all the states, were also beneficiaries of the apportionment principle.

13. The British empire extended to Canton, China, where agents of the East India Company were deeply impressed by the effectiveness of the exam-based Mandarin bureaucracy in ruling the world's largest empire over long periods of time. Later, when the Company began to experience severe difficulties administering the growing Indian empire from London (the tendency of British retainers in India to become Indianized prebendaries (*nabobs*), going into business on their own account, compelled London to realize that drastic measures were needed to re-assert imperial control over its far-flung and distant possessions) they decided to borrow the Chinese design. Glimpses of the anarchy prevailing among Englishmen in India in the 18th century can be found in Spear (1963, pp. 80-94). By the mid-nineteenth century, the successful Indian (Chinese) mandarin system was extended to England, where only youthful graduates of the most prestigious universities (Oxford and Cambridge) became entitled to take classical and literary exams through which an elite corps of generalists--the "Administrative Class"--joined the government service and became its ruling cadres (Teng 1943).

14. Was there a kind of culturally-determined egalitarianism in America that prompted rejection of the British model of an elitist Administrative Class? Van Riper (1958) has suggested that this rejection rested on a deep-seated aversion to the elitism inherent in the recruitment of graduates from prestigious universities to serve as future **mandarins** (p. 101). However, he also tells us that the Congressional debate thoroughly explored "the likely effects of the proposed legislation upon the constitutional position of the President and Congress, upon the party system..." (p. 97). Whether consciously or not, members of Congress may have sensed that careerists, rooted in **functionism**, would be more responsive to legislative committees and more dependable as political allies than would an elite core of bureaucratic generalists (Riggs 1988, pp. 363-5, and p. 376, note #40).

15. Aberbach and Rockman (1988) characterize the bureauphilic view that "a professionalized bureaucracy ...elevates the effectiveness of government..." as "the 'mandarin' perspective--a term

that resonates, for historical reasons, better in Europe than in the United States" (p. 606) We need to understand the reasons for this historical dissonance, and to recognize the basic difference between a professionalized bureaucracy and a mandarinate.

Mandarins, following the European (parliamentary) model, include generalist (cross-cutting) elite cadres who can, indeed, become a "ruling class," gaining widespread acceptance of their autonomous authority. By contrast, in the U.S. (presidentialist) system, a different model of policy-oriented (corner-fighting) specialists, climbing intra-agency career ladders, should be referred to as *functionaries*, a far less potent or authoritative class of bureaucrats than the mandarins. Many, if not most, of them are professionals whose extra-bureaucratic standards and reference groups differ strikingly from the orientations typical of mandarins.

It does, therefore, convey a misleadingly "European" notion to speak of American careerists as *mandarins*. Fortunately, we can use the broader term, *careerists*, to refer to all merit-based officials regardless of whether they are generalists or specialists--mandarins or functionaries. Remember, however, that retainers are not careerists, and most bureaucrats in presidentialist regimes (except the U.S.) are retainers. For more details, see Riggs (1988, pp. 364-5 and p. 376, note 40). In America, virtually all careerists are functionaries, and many of them are now also professionals.

According to Aberbach and Rockman (1988), bureauphobes argue that only officials appointed by the elected political authorities (i.e. the transients) ought to have "discretionary authority within the administrative apparatus..."--they are exponents of the "mandate" perspective (p. 606). This perspective gains its importance in the American context from the power of professionals in the career bureaucracy. In order to compel them to give more weight to the politically based priorities of elected politicians, especially the president, transients apponted by each successive administration are charged with a **mandate** to oversee and direct the careerists, compensating for their professional "biases".

Concerning the change from the British closed mandarin model to the American open functional design, Van Riper (1958) tells us that "We thoroughly adapted [the British model] to the American political and social climate" (p. 100). This cultural explanation needs to be amplified by consideration of the structural (constitutional) implications of the substitution of functionaries for mandarins in the American polity.

16. Rourke (1991) tells us that the "closed [iron triangle] system is long gone, a casualty of the 'glastnost' that swept over American government beginning in the 1960's" (p. 119). Among the causes that he identifies are the growing scrutiny of bureaucratic conduct by legislators and interest groups, the growth of grassroots political activism, the increased extra-bureaucratic expertise found in think tanks, Congressional staffs and research agencies, and the rise of "issue networks," i.e. interactive public interest groups and professionals armed with expert knowledge. Rourke's more recent thinking on this subject can be found in his APSA paper (1992).

The "iron triangles" metaphor is admittedly too rigid to characterize the American political system as a whole, but the phenomenon itself has not disappeared. Rather, it has become absorbed in a larger and more comprehensive structure of **interest networks**. In addition to the traditional "triangles," we find "**issue** networks" that link bureaucratic professionals with professional schools, private practitioners, and a host of non-profit research and action organizations. I would add, also, the **golden webs** formed by in-and-outers, beneficiaries of the "revolving door" which incumbents use to establish intricate networks of collaboration between officials, consultants and private organizations, again cutting across all three branches of the presidentialist regime, and penetrating a vast number of autonomous regulatory agencies, boards and commissions.

Taken as a collectivity, **interest networks** constitute a gargantuan and complex system of interests, issues and norms that sustain the highly dispersed structure of policy planning and implementation in vast reaches of American public life. I believe that these networks actually ease

the burdens carried by American Presidents, and make the Executive office more viable. By contrast, no doubt, some observers view this infrastructure as an impregnable monster over which the President cannot really impose his will. After outlining three available but equally unsatisfactory options open to a President who seeks to dominate and direct the executive establishment, Heclo (1978) concludes that there is no "...neat way out of this trilemma..." Instead, he thinks, the President "...is bound to become a creature of the issue networks and the policy specialists" (p. 122).

The Heritage Foundation, a conservative think tank, offers another perspective on this phenomenon. For example, we read in Jones and Marini's book on *The Imperial Congress* about how the ("Democrat-controlled") Congress has usurped Presidential powers and undermined the presidentialist Constitution's prescribed separation of powers. A chapter by "H.A.Mellor" (pseudonym for a former DOD official and Congressional aide) details some of the practices whereby interested members of Congress intervene in the appropriations and policy-making processes of the Defense Department to achieve very costly and unfair results through "micromanagement" that seriously undermines the powers of the Presidency. Mellor concludes that "The final irony in the struggle between Congress and the executive branch is that, were Congress to more evenly share its responsibilities, treating the executive as a coequal, rather than as a servant, many of these problems would disappers" (Mellor 1988, p. 129).

Nevertheless, in a comparativist perspective, American Presidents are more fortunate than their counterparts in polities where the interest networks are not so well developed or have highly personal and particularistic priorities. Outside the U.S., I believe, Presidents must personally intervene in more current issues or face more public fiascos and disasters than does the American President: at least, this is a hypothesis that deserves to be investigated.

17. "A professional," according to Wilson (1989), is "someone who receives important occupational rewards from a reference group whose membership is limited to people who have undergone specialized formal education and have accepted a group-defined code of proper conduct... .In a bureaucracy, professionals are those employees who receive some significant portion of their incentives from organized groups of fellow practitioners located outside the agency" (p. 60). Here Wilson stresses professional standards. A cause-effect relation is implicit: when recruitment is limited to persons with professional standing, we may expect them to adhere to follow standards.

18. Such a situation exists, as I write, in Nicaragua where the Supreme Court has declared all current acts of Congress unconstitutional. Under a presidentialist constitution, the Court, whose life members received their appointments from the Sandinistas, has supported the Sandinista minority in Congress after they chose to boycott its proceedings, thereby destroying the possiblity of securing a quorum. The Congress had attempted to reverse a law adopted during the final days of the Sandinista regime which had awarded previously confiscated property to Sandinista leaders. Although President Chamorro strove to conciliate the Sandinistas by various means, including the naming of Humberto Ortega, brother of the former President, as head of the armed forces, she now finds herself in a double-bind which effectively blocks action on numerous urgent problems. In the ensuing government crisis, constitutional decision making is effectively blocked and it is hard to see how a military solution can be avoided.

19. Waldo (1968) observed that "The attitude of political scientists [toward Public Administration]... is at best one of indifference and is often one of undisguised contempt or hostility" (p. 8). He also claimed that "...it is now unrealistic and unproductive to regard public administation as a subdivision of political science..." (p. 7).

20. The rotation and functionist merit system reforms which have enabled the American government--exceptionally, I believe--to fend off the dangers inherent in bureaucratic power and dissatisfaction have lulled most American academics into a misplaced confidence in the essential

durability of presidentialism as a constitutional design. This perception has spread to other countries where some reformers see presidentialism as a more stable political system than parliamentarism. Prindle (1991) claims that a widespread preference in the third world for *presidential* regimes suggests they are more viable than parliamentary systems (p. 62). This perception may reflect a failure to distinguish between frequent cabinet changes and regime collapse. Admittedly, a highly polarized multi-party parliamentary regime is very likely to experience many cabinet crises. Such crises, however, occur within a constitutional regime--they do not necessarily generate a regime breakdown.

An interesting test case is provided by Nigeria which began its life as a new state in 1960 with a British-style parliamentary government. Following the coups of 1966 and 1975, a presidentialist constitution was promulgated in 1978. In 1985 another coup occurred. The military regime under General Ibrahim Babangida which followed promised to reconstitute representative government through a five-year process launched in 1987, leading to a revised version of the 1978 constitution.

The Nigerian case is exceptional, however: for the most part, representative governments reconstituted after a phase of bureaucratic domination have recreated the basic structure of their pre-coup regimes. The empirical evidence shows that presidentialist regimes are much more likely to break down as a result of a coup than are the parliamentary regimes (Riggs 1993b).

21. As reported by Ventriss (1991), a recent survey found that "...only 13 per cent of Senior Executive Service (SES) managers would recommend a governmental career to young people" (p. 275). The enthusiasm generated by direct recruitment of junior mandarins from the universities (as in the UK) cannot, apparently, be replicated when senior officials are wrenched out of their long-term functionary (or professional) roles and secure interest networks to become neuveau "mandarins" in a bureaucratic stratum lodged precariously between suspicious political appointees and envious former colleagues in the career civil services.

More practical considerations added to the demoralization of the SES: Bonafede (1987), for example, reports that more than half of the career members of the SES have "...left the government and at least 1,000 'simply retired' because of disagreements over the pay cap, the limitations on bonuses, the inadequate relocation allowances and other points of conflict" (p.135--quoting Blair Childs, executive director of the Senior Executives Association). Former executives who retired from the SES are reported to have "increased their annual salaries by an average of $17,800 in the private sector" and about 46% of current SES members "are thinking of leaving because of inadequate salary..." (p. 136).

One might add that in a parliamentary system financial incentives for top civil servants need not be tied to those of legislators: by contrast, in the U.S. "The pay link bonding the salaries of executive level personnel with those of members of Congress is generally condemned and is widely regarded as the cause of the inability to set fair and equitable government salaries" (Bonafede 1987, pp. 136-7). The point, of course, is that Congress incurs so much public wrath when it tries to raise the salaries of its own members that it compensates by supplementing its own income from outside sources (essentially "prebendary" in character) while penalizing the Executive branch by setting pay limits that restrict official salaries to no more than their own. Ironically, the weakness and low morale of the SES may, perversely, enhance the viability of presidentialism in the U.S.--notably by not really undermining it.

22. Had the British model been adopted without significant revisions, a youthful cadre of future mandarins, recruited from elite universities, would have rotated among government programs, acquiring a generalist (cross-cutting) orientation that could have brought them to the top of the Executive Branch as powerful superbureaucrats. One of their early goals would have been to reconcile turf battles between rival bureaus in the same Department but, eventually, they would have intervened in inter-departmental struggles to help Secretaries resolve their own intra-cabinet conflicts. It is important to remember that a presidentialist *cabinet*--unlike its parliamentary

prototype--has no motive for solidarity. "In the day to day work of the Cabinet member, each man fends for himself without much consideration of Cabinet unity" (Fenno 1959, p. 247). If mandarins ("superbureaucrats"--see Campbell and Szablowski, 1979) became top advisers or "undersecretaries," they would seize the opportunity to counteract the dispersing pressures of the presidentialist format. For a lucid account of the way different American Presidents have attempted to work with and coordinate their Cabinet members, see Campbell (1986, pp. 37-57).

Ultimately, I imagine, they would also be able to curtail the powers of Congress, perhaps through a constitutional amendment to set limits on the terms of office of all elected officials and to require Congressional committees to elect their leaders--such an attack on "senioritism" would be eagerly supported by liberal reform leagues (the common cause and public citizen lobbies) and even the Republican right. West (1988), a resident scholar at the Heritage Foundation, reminds us that "In the 1968 election, 98 percent of House incumbents who ran for reelection won... Until this pattern of automatic reelection changes, senators and congressmen have no incentive to change" (p. 311). No doubt the new superbureaucrats would find eager allies on both the right and the left to join in a major reform campaign to "democratize" the American government.

If such strategies were to succeed, the American President would be reduced to a purely symbolic Head of State, national parties would wither as effective political organizations while their volunteer and PAC supporters would lose interest in them: the superbureaucrats would constitute a kind of "college of cardinals" to nominate future presidents gifted with the prestige and pliability needed to serve as national figureheads. A pliable Congress would continue to legitimize the government's decisions, but its frequently rotating members would find themselves dependent on mandarin officials for the information needed to ratify "sound" legislation.

No doubt this futurist vision of the power potential of a mandarinate sounds far-fetched, yet it could inspire a British science-fiction novel: *The Rise of the Meritocracy, 1870-2033* (Young 1958). Actually, the concentrated and politically entrenched cabinet in a parliamentary system is far better equipped to manage and control such a mandarinate than is any dispersed and fragile presidentialist regime, including that of the United States. No doubt British cabinets are not as cohesive as we imagine: Colin Campbell (1986) tells us that "...executive harmony does not come as readily to British governments as Americans expect" (p. 27). Nevertheless, despite "Yes, Minister," the power potential of British executives surely exceeds that of American Presidents.

23. Discussing the consequences of the rise of issue networks, Heclo (1978) observes that, "Instead of party politicians, today's political executives tend to be policy politicians... Their reputations among those 'in the know' make them available for presidential appointments. Their mushiness on the most sensitive issues makes them acceptable. Neither a craft professional nor a gifted amateur, the modern recruit for political leadersip in the bureaucracy is a journeyman of issues" (p. 106). Although the President can make many final choices, he/she is constrained to select amphibians who are acceptable to competing issue networks rather than to reward politicos who supported the winner's electoral campaign.

Moreover, the president is also constrained by the unwillingness of many highly qualified persons to undergo the costs of accepting (and retaining) political appointments: e.g. relatively low salaries, painful questioning in the Senate, elaborate and time-consuming clearances. Commenting on "The Quiet Crisis" growing out of the inability of the U.S. Government to attract qualified personnel, Bonafede (1987) writes of "...the dilemma over fixing government salaries comparable to those in the private sector, and the resulting controversy created by the issue..." plus the "...harm to the quality of government caused by the exodus of public officials..." (p. 134). He discusses the grueling experience of nominees facing Senate confirmation hearings and hostile reporters, the red tape and delays associated with security and conflict of interest clearances, plus such factors as: "petty aggravations, low pay, high cost of living, inadequate expense allowances, long hours, and the surrender of much of their personal privacy" (p. 139).

Such perceptions clearly identify some of the significant costs of maintaining a viable presidentialist system of government, but without a comparativist framework, it is difficult to understand its constitutional basis: we are left to deal with the symptoms rather than the underlying causes of these problems.

24. Anyone who counts on the Judicial branch to facilitate the coordination of government programs will be disappointed. Although the effects of court proceedings on public administration have received a good deal of attention, I do not know of any discussion of their implications for the dispersal/coordination of bureaucratic activities. My guess is that judicial decisions actually intensify the dispersal of power in American bureaucracy, compelling agencies to employ more lawyers, to rely more on administrative law and procedure, to establish their own quasi-judicial processes, and to compel administrators to become ever more specialized in their knowledge not only of program policies and methods but also of the laws and precedents affecting their implementation.

This might, perhaps, engender even more specialization, boundary maintenance, and rigidity which, in turn, justifies the intrusion of more political appointees to promote coordination, flexibility and political sensitivity. The proliferation of Judicial and Congressional staff services and their associated technical requirements and procedural limitations also reinforces these processes. Although public administration may suffer as a result, the resilience of the constitutional system is enhanced. However, these are admittedly speculations and I cannot defend them with any self-assurance.

25. Durant's (1990) stimulating discussion of "appointee-careerist relations" provides ample evidence for the conflicts and accomodations generated by the fundamental cleavage within the American polity between bureaucratic transients and careerists. What his analysis leaves out, however, is any explanation of why this cleavage is necessary for the survival of democratic presidentialism, even though it produces fundamental problems, both political and administrative, of great magnitude. Similarly, Light (1987) tells us that "Presidents and their appointees must move quickly to succeed. In responding to that pressure, careerists must be sensitive to the dynamic nature of the policy process" (p. 173). Light's analysis, based on data collected in the 1985 Presidential Appointee Project of the National Academy of Public Administration, is rooted solely in the American experience, and offers no comparisons to suggest the truly exceptional character of this situation.

Actually, of course, the appointee-careerist dichotomy oversimplifies the American reality where, for example, there exist many independent regulatory agencies which, collectively, are often viewed as a "headless fourth branch" of government. It is impossible to discuss this phenomenon here. Its critics allege that by delegating legislative/executive/judicial powers to these autonomous agencies, the effective powers of both President and Congress have been seriously eroded--a strong attack on them is offered by Nolan Clark (1988), currently an official of the Federal Trade Commission, who writes that "Almost without exception, independent regulatory agencies have failed to promote the public interest" (p. 271). I can only speculate about the extent to which comparably autonomous bodies have been created in other presidentialist polities but I suspect that, despite their many flaws, they facilitate the survival of American presidentialism by reducing the burdens placed on both the President and the Congress, and reducing the stakes in the winner-takes-all electoral sweepstakes identified by Juan Linz.

Both the bureauphiles and the bureauphobes seem to think that we are free to choose a very different design: they would increase the ratio and enhance the power of career officers (and independent commissions), or subject them to more stringent control by transient appointees. The "realpolitik" model--or Heclo's "conditional cooperation" (Heclo 1977, p. 193)--accepts the status quo, however, and offers a formula for trying to make unavoidable confrontations manageable in a system that cannot survive without both careerists and transients. However, I suspect that the "realpolitik" formula might be strengthened if it explicitly recognized that the American

constitutional system could not survive without the cleavage, thereby rebutting the more extreme views of both the bureauphobes and bureauphiles.

26. The non-comparativist way of viewing American Public Administration still hampers our ability to understand public administration anywhere, and especially in the United States. Had students of American government paid attention to the tragic experiences of all the countries that emulated the American presidentialist design, they would have seen that constitutive systems in presidentialist regimes are typically unable to control their bureaucracies and coups have taken place in almost all of them.

They might also have seen that although the exceptional survival of the U.S. regime can be explained, in part, by the relative workability of its constitutive system (attributable in large measure to the persistence of some undemocratic practices) a fuller explanation must also take into account the relative weakness (politically) of its bureaucracy. This weakness is due to such factors as federalism, privatization and transient political appointments combined with a professionalized career bureaucracy. The capacity of this mixed bureaucracy to administer well in specialized program areas also reduces the incentive for military coups.

Comparative analysis might also have led to the conclusion that parliamentary regimes are typically able to control more powerful and administratively effective buraucracies, and that generalist administrators (*mandarins*) can well coordinate complex inter-agency programs (health care or drug enforcement, for example) that cannot be managed by the American professionalized bureaucracy. The cultivation of a top cadre of mandarin administrators in the U.S., however, would seriously undermine its presidentialist regime. Reliance on transient political appointees is an unavoidable necessity for regime survival in the U.S., despite their inability to help the President achieve effective coordination in a highly dispersed (and professionalized) bureaucratic system.

Viewing American bureaucrats as essentially *non-political* actors has also blinded Americans working in the Third World to the vast incongruity between powerful bureaucracies and weak constitutive systems in many of these countries. They could not see, therefore, how projects designed to enhance the administrative capacity of these bureaucracies would further strengthen them politically, contributing thereby to the likelihood of coups and bureaucratic domination, with accompanying deterioration of administrative capabilities.

27. The political realities that enabled Public Administration to emerge as an important field of study in the U.S. have remained invisible to analysts who assumed they could ignore politics as a relevant factor to analyze. They remained unaware of the exceptional political weakness of American career officials which enabled them to cultivate Public Administration as a non-political subject. Paradoxically, bureaucratic rulers who display, in an extreme form, the unity of politics and administration, are quite tolerant of university programs in Public Administration, whereas they look askance at departments of Political Science. Precisely because the former, under American inspiration, are viewed as *non-political*, they are seen as non-threatening, whereas the latter are feared as potential trouble-makers for the ruling group.

STATE-NGO RELATIONS AND THE POLITICS OF SUSTAINABLE DEVELOPMENT IN INDONESIA: AN EXAMINATION OF POLITICAL SPACE

James V. Riker

Global Studies Research Program
University of Wisconsin - Madison
1120 West Johnson Street
Madison, WI 57315-1045

Prepared for presentation at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993. Copyright by the American Political Science Association.

STATE-NGO RELATIONS AND THE POLITICS OF SUSTAINABLE DEVELOPMENT IN INDONESIA: AN EXAMINATION OF POLITICAL SPACE

James V. Riker[1]

I. INTRODUCTION

In December of 1986, two key officials within the Malaysian government labelled five indigenous non-governmental organizations (NGOs) "urban terrorists" and "thorns in the flesh" of the nation.[2] Ten months later, the Mahathir government detained without trial several NGO officials under the Internal Security Act.[3] Even though the NGOs involved were working on industrial pollution, forestry, and nuclear power issues, their leaders along with other groups in society were accused of creating political instability. All NGO officials were eventually released, but the crackdown has left an indelible impression on Malaysia's NGOs working on politically sensitive issues.

Meanwhile in the Philippines, after years of similar government repression and harassment of NGOs during the Marcos regime, NGOs have flourished following the People Power Revolution in the spring of 1986. Philippine NGOs have played an increasing role in shaping the political and development agendas by lobbying for policy changes, preparing national plans and manifestos, and most recently, endorsing political candidates who are committed to the issues of agrarian reform, people's empowerment, and sustainable development (McBeth, 1991). Recognizing the vital developmental and democratizing functions played by the voluntary sector, President Cory Aquino recently announced her decision to work with Philippine NGOs upon leaving office to bring to fruition her vision of people-powered development.

These two cases highlight the political tensions arising over NGOs' efforts to expand their political space through greater participation in the political arena and government's efforts to restrict it by limiting NGOs' role.[4] In both countries, NGOs have put forward demands that have emerged from the grassroots level of society and pushed them onto the political agenda at the national level. Yet the Malaysian government has sought to curtail NGOs' advocacy role in the development process, whereas the Philippine government has sought to tackle agrarian reform, pressing environmental problems, and rural poverty through joint government-NGO committees within a number of government ministries. These contrasting cases raise four key issues for many Third World countries: how much political space do NGOs have to participate in the development process within a polity? How does the state expand or limit that space? How can NGOs themselves act to expand their political space for participation in both the political and development processes? And finally, on what issues will the state and NGOs wage battle, where the former seeks to coopt and even repress the latter?

A. The Focus of this Paper

The dynamic tension between NGOs maneuvering for greater participation in the development and political processes and the state trying to curb NGO activities illustrates the shifting boundaries of political space. In Southeast Asia, the case of contemporary Indonesia best illustrates this tension. The prolific growth of indigenous non-governmental organizations (NGOs) in Indonesia during the 1980s has made them a key institutional actor in environmental and development politics. Since the early 1980s, Indonesian NGOs have initiated an ongoing debate about the nature of environmental and development policy in Indonesia, and the role of the state, NGOs' and people's participation in the development process. Indonesian NGOs have promoted development from below and have built linkages at the grassroots, regional (sub-national), national and international levels in support of sustainable development. Indonesia's NGOs are putting pressure on the government not only domestically but through their linkages with international environmental groups in the U.S., Europe, and most recently Japan. Indonesia's environmental NGOs have largely spearheaded these broader efforts to gain greater political space vis-a-vis the government. However, as Indonesian NGOs have gained greater political space in the late-1980s and early 1990s, the Government of Indonesia has subjected them to greater scrutiny and taken a number of measures to limit their autonomy (Witjes, 1986; Billah and Nusantara, 1989; Hein, 1989; Riker, 1990). Thus, it is within this setting that the debate over the definition and direction of sustainable development is being waged by NGOs in Indonesia.

The purpose of this paper is to understand the rise of NGOs in Indonesia especially in the environmental sphere, to review the strategies NGOs have employed at both the micro and macro levels to gain greater legitimacy vis-a-vis the state, and to interpret the Suharto government's response to the growing coalition for sustainable development both at home and abroad. Thus, this analysis addresses the political dynamics which characterize the relations between the state and NGOs, describing how the Suharto government has sought to contain and coopt the NGOs, while NGOs have sought to increase their political space by raising the banner of sustainable development and shaping its discourse in Indonesia.

II. UNDERSTANDING NGOs: WHAT THEY ARE AND WHAT THEY CONTRIBUTE TO THE ENVIRONMENT AND DEVELOPMENT DEBATE

The rise of NGOs in the Third World has largely been in response to an often overwhelmed and incapacitated state sector in addressing the pressing development needs of people at local levels. Both the quantitative and qualitative growth of organizations within the voluntary sector during the 1970s and 1980s has principally occurred in development activities where NGOs enjoy comparative advantages and in areas often beyond the reach of

the state (Uphoff, 1987; Bratton, 1989; Paul, 1989). In addition, however, NGOs have emerged to redress failures and inequities in the market system, and to mitigate structural constraints imposed by the state by targeting their activities toward, and acting as advocates for, the poor (Korten, 1990; Fowler, 1991). In the 1980s, many NGOs promoted sound environmental practices and became leading advocates for sustainable development both in the South and the North (Durning, 1989; Korten, 1989, 1992; Yap, 1990; Livernash, 1992). While many NGOs' roots lie in community development activities and in grassroots activism begun over the last two decades, the scope of their initiatives has reached beyond the subject of economic and social development to reshape and redefine civil society as well as its relations with the state (Bratton, 1989; Riker, 1991; Elkins, 1992).

A. Defining NGOs

For my purposes, NGOs are defined as indigenous voluntary, non-profit organizations that undertake community development, provide social services, protect the environment, and promote the interests of the poor (Williams, 1990). NGOs operate at all levels of society and across the political spectrum. While NGO often propose "divergent" solutions, "they share two common elements --a pragmatic" commitment to demonstrated results in the field and on the need to strengthen civil society (Breslin, 1991:7). Where the legitimacy of governments to provide for and to govern their peoples is at issue, NGOs will continue to find an expanding role in creating new opportunities in the economy, society and polity (Uphoff, 1993). Indeed, key areas have clearly been staked out where state performance will likely be at issue. These include: 1) protecting the environment, 2) promoting poverty alleviation, and 3) upholding human rights -- all areas where Third World state's are particularly vulnerable to criticism. The key issue remains, however, how much political space do NGOs have to participate in the development process within a polity?

B. Toward A Theory of Political Space[5]

While the term "political space" has long been part of political scientist's lexicon, as a concept it has generally lacked any kind of systematic rigor.[6] The context within which NGOs operate, and the breadth of activity they are allowed, is determined by the interaction between the state and NGOs. This political space is a sensitive, ever-changing environment which all actors strive to shape to their purposes and to their visions of development. The state may encourage, tolerate, interfere, discourage or abolish NGO activity through legal or coercive means. However, NGOs may influence these parameters, bringing salient issues to public attention, advocating certain policies or development priorities, and pushing the state to expand the parameters in an unexpected manner.

In conceptual terms, political space refers to the arena in which non-state actors may undertake initiatives independently vis-a-vis the state. To what degree do these actors such as NGOs enjoy independent freedom of action? It is a dynamic, ever changing balance (or tango) between two or more actors where the contrasting principles of autonomy and control define government-NGO relations (Bratton, 1989). The boundaries of political space may contract or expand if one actor perceives its legitimacy is affected by the activities of the other actor. Independent NGOs, people's organizations and other groups in civil society seek to expand the political space in which they can organize and operate freely as well as increase political participation. On the other side, co-optive governments seek to contract the political space available to these non-state actors to limit the activities occurring outside the government's control. Clearly, the level of political space will differ within a polity across geographic regions, among government ministries, and within ideological groupings.

I argue that the rise of environmental NGOs in Indonesia's authoritarian political order must be seen in the context of political space. That is, first and foremost the environmental arena has provided NGOs with a safe and acceptable basis by which to organize. By choosing a sectoral area where international NGOs' enjoy considerable legitimacy and where the Government of Indonesia lacks expertise, especially at the field level, Indonesian NGOs have gained a foothold in the political sphere. In Indonesia, indigenous NGOs were first given official government recognition in national legislation dealing with the environment in 1982 (cf. Hainsworth, 1985; Hasan, 1985; Tarrant et al., 1987; Cribb, 1988; Hardjasoemantri, 1989, 1990). The growing prominence of Indonesian environmental NGOs in the late 1980s has enabled them to critique the government's development plans not only in the environmental and development spheres but also in the areas of human rights and political reform (Aditjondro, 1990c). By challenging the state's notions of development, NGOs are delegitimizing the state and seeking to gain greater legitimacy for their own pluralist visions of sustainable development. Thus, Indonesian NGOs' actions constitute the first signs of pluralism in Indonesia's authoritarian political order in over 25 years.[7] Given this framework, I argue that environmental NGOs should be seen as one essential part of a nascent social and political movement for liberalization in Indonesia.

III. THE CONTROVERSY OVER SUSTAINABILITY IN INDONESIA

A. Defining Sustainable Development: Beyond *Our Common Ground*

The World Commission on Environment and Development, known as the Brundtland Commission, defined sustainable development as meeting present development needs "without compromising the ability of future generations to meet their own needs" (i.e., inter-

generational equity) (1987:8). The Commission broadly saw sustainable development as:

> "a process of change in which the exploitation of resources, the direction of investments, the orientation of technological development, and institutional change are all in harmony and enhance both current and future potential to meet human needs and aspirations" (WCED, 1987:46).

In so doing, the Commission assumed that environment and development objectives are <u>not</u> irreconcilable, but when conceived within the framework of sustainability can be the basis for the new "development paradigm of the 1990s" (Lele, 1991:607). Yet the term is fraught with considerable conceptual ambiguity, allowing it to be appropriated by quite diverse groups (Lele, 1991).[8] For instance, the concept of "sustainable development" has been embraced by diverse actors from grassroots to international environmental NGOs (ANGOC and ELC, 1989; Durning, 1989; Yap, 1990), Third World governments (South Commission, 1990), and the World Bank (1988a, 1990b, 1992). In its broadest conceptualization, sustainable development's main principles include a concern for:

- inter-generational equity;
- improving human welfare (i.e., poverty alleviation);
- distributional equity (i.e., economic growth with equity);
- balanced or sound resource use (i.e., sound resource management);
- maintaining the carrying capacity of the biological system by promoting environmental protection; and
- "the participation of all sectors of society in decision-making" (Ascher and Healey, 1990:10).

I am not going to belabor the semantic issues or discuss the merits or shortcoming of various conceptualizations here, but rather focus on the emerging political debate in the Third World over the nature of environmental management and development waged in the name of sustainability. Ultimately, whether sustainable development becomes a reality or not depends on whether "effective political support" emerges for such a goal within a polity (Caldwell 1984:305; 1990).[9]

B. The Case of Indonesia: Why does the Issue of Sustainable Development Matter?

I believe it can easily be argued that the ecological pressures for pursuing sustainable development are more compelling in Indonesia than anywhere else in Asia. First, population, land, and food pressures on Java are placing inordinate demands on its natural systems (Hardjono, 1986, 1991; Soemarwoto, 1989; Repetto, 1986; Cribb, 1987a; Roche, 1988; Donner, 1987). The island of Java is the same size as the state of Florida but has over 110 million

inhabitants, over 60 percent of Indonesia's total population. In order to ease population pressures on Java, the Government of Indonesia has undertaken the largest resettlement effort in the world. The Transmigration Program, as it is commonly known, has moved hundreds of thousands of people to cleared rain-forest areas with degraded soils while displacing indigenous peoples (Colchester, 1986; Secrett, 1986; Aufderheide and Rich, 1990:66).

The extent (i.e. land area) of Indonesia's tropical forests is second only to Brazil's, and accounts for about 60 percent of Asia's tropical forests (World Bank, 1990).[10] However, FAO estimates that the rate of deforestation is as much as 1 million ha per year of Indonesia's 110 million hectares in permanent forest, with estimated direct costs to the Indonesian economy about $1 billion year (i.e. deforestation, timber depletion) (World Bank, 1990:xx-xxi; Economist, 1990; Allen, 1987). Besides constituting a key part of the Earth's lungs, Indonesia's tropical forests are among the world's most biologically diverse "with 40,000 plant species, about 5,000 tree species, 1,500 bird species, nearly 500 species of mammals, 7,000 species of fish, and 1,000 species of reptiles and amphibians" (Holdsworth, 1990:8). However, the high extent of habitat destruction due to deforestation makes "Indonesia's list of endangered species greater than Brazil's" (Holdsworth, 1990:8). Thus, there is a critical need for sound forestry management strategies to reduce the environmental impact of logging (both legal and illegal) and to conserve the biodiversity of flora and fauna found in these forests (cf. Murphy, 1988).

Despite these compelling ecological realities, these factors do little to account for the prolific growth of Indonesian NGOs active in the environmental arena in the mid-1980s. In fact, only a handful of Indonesian NGOs deal with the issues of tropical forestry management, conservation of biodiversity, or the impact of the government's transmigration program (Tarrant et al., 1987). Instead, insights about the pattern and scope of acceptable NGO participation in the development process and NGOs' relations with the government may provide a better explanation.

C. Why is Sustainability at Issue? Contending Perspectives on Sustainable Development in Indonesia, 1978-1992

Since 1978, contending viewpoints have emerged between the Government of Indonesia and NGOs about the definition and direction of sustainable development in Indonesia. Initially the Government of Indonesia embraced the concept by establishing the Ministry for the Environment in 1978 to promote "environmentally sound development" which it defined as the:

> "conscious and planned endeavor to utilize and manage resources wisely in sustainable development to improve

> the quality of life" (Act of the Republic of Indonesia, No. 4, 1982, Article I, Paragraph 13).

In late October 1987, the Government of Indonesia endorsed the concept by issuing the Jakarta Resolution on Sustainable Development by ASEAN Ministers (World Bank, 1990). In addition, "sustainable development" was the special topic of the annual donor consortium (IGGI) meeting at the Hague in June 1988, and it constitutes an important theme in the State Guidelines for the last five-year Development Plan (Repelita V - 1989-1993) (World Bank, 1990:136; Republic Indonesia, 1989). On World Environment Day in June 1989, President Suharto acknowledged Indonesia's commitment to pursuing sustainable development, but noted that Indonesia could not do so without a conducive international environment, stating:

> "Sustainable development is by no means an easy task to carry out and the task will be more difficult to accomplish if the international community fails to help create a climate that supports development" (Jakarta Post, June 5, 1989).

However, for the Government of Indonesia, sustainable development has been seen mainly as environmentally sound resource use and development.

1. A Government Advocate for Sustainable Development: Emil Salim

The main proponent for sustainable development within the Suharto Government has been Emil Salim, who served as Minister of Population and Environment from 1978 until March 1993. Salim is internationally recognized for his progressive stance on environmental issues, having served as a member of the World Commission on Environment and Development in the mid-1980s. In 1990, Salim was awarded the J. Paul Getty Wildlife Conservation Prize for his leadership on conservation matters. Western conservationists and development agencies largely view him as "the single ray of hope in an otherwise environmentally unenlightened government" (Survival International, November 1990). Consequently, he has been quite successful in mobilizing international donor support for environmental programs in Indonesia. Despite his favorable international credentials, within Indonesia Emil Salim is frequently portrayed as walking a tightrope between taking action on the environment and holding onto his position within the government. He has been a tireless advocate for the environment who is not afraid to criticize the environmental records of industry, forestry concessionaires, and mining companies, many of whom have close ties to the Suharto government (Aditjondro, 1990c).

Despite Emil Salim's personal commitment to the vision of environmentally sound and sustainable development,[11] he lacked the political resources within the government to realize this vision.

Salim's ministry has been the main arena for debating environmental policy in Indonesia. One donor official, who was familiar with the Ministry of Population and Environment, argued that "it is weak politically and lacks the ability to enforce any of its legislation."[12] Salim himself revealed the extent of his limited political power within the Suharto government in April 1987 when he stated that "experience has taught us that an environmental agency can only be functional if it has access to a nation's highest level of authority, and to planning and resource allocation processes at the highest level" (Salim, 1987:2). Given a weak ministry without a line agency or implementation role throughout the late-1970s and 1980s, Emil Salim was hard pressed to show much progress on slowing environmental degradation and promoting environmentally sound development.[13] Consequently, since 1979 Emil Salim has taken the initiative to cultivate the support of NGOs to build a domestic constituency for sustainable development with considerable donor support (cf. Hainsworth, 1985; Tarrant et al., 1987; Hanson 1987).[14] Salim played an instrumental role in formulating Indonesia's Environmental Management Act in 1982 which recognized the right of NGOs to act as community institutions for environmental management and development. Salim's defacto support for NGOs resulted in the initial mushrooming of environmental NGOs in Indonesia under the banner of sustainable development in the 1980s (Aditjondro, 1990c).[15]

2. Environmental NGOs Have Also Embraced the Concept of Sustainable Development

Within the environmental sphere, NGOs have gained official government recognition and a legitimate role in the development process through the enactment of the environmental legislation of 1982 and environmental impact assessment regulations of 1986 (Republik Indonesia 1982, 1986). NGOs, in turn, have sought to improve environmental awareness and promote environmentally sound development by addressing poverty and environmental degradation at all levels of society. While the Indonesian government has primarily sought to limit NGOs to an implementation role (i.e., a supply-side approach), NGOs have sought to gain greater influence over the decision-making processes affecting environment and development by pushing their own visions of sustainable development (i.e., a demand-side approach).

NGOs have sought to become the guardian of the environment and a force for government accountability in environmental management and development policy more broadly. NGOs have challenged the Government of Indonesia to match its words with action. As Cribb states: "What the NGOs offer, primarily, is an alternative source of expertise with an ability to argue that the government should live according to its rules" (1990:1133). Indeed, leading NGO officials argue that unless the Government of Indonesia is pressed by environmental NGOs, it will not likely enforce its environmental standards. Consequently, NGOs have initiated an ongoing debate

that is being waged at the grassroots, regional (sub-national), national, and international levels about the nature of environment and development in Indonesia, and the role of NGOs' and people's participation in the development and political processes. Environmentalism, through the language of sustainable development, has become a means for articulating opposition to the prevailing development policies and the authority of Indonesia's New Order government.[16] Given the prevailing politics of language in Indonesia in the 1980s, NGOs have often criticized the government on environmental grounds first as a disguised way of raising broader social justice and political concerns within Indonesia's authoritarian political order. As environmental NGOs have grown more confident, they have issued appeals for equity-led growth, people's participation in decision-making, respect for human rights, and even democracy.

D. The Politics of Sustainable Development: State-NGO Relations

State-NGO relations are now at issue whereby sustainable development has become the battleground of the late-1980s and early 1990s. Tensions have intensified between the Government of Indonesia and NGOs, where the government has sought to place controls on NGOs' and thus curb their political space (i.e., freedom of action), and to re-assert its control over the environmental domain. At the same time however, NGOs have responded through various strategies to improve their ability to maneuver vis-a-vis the Government of Indonesia, especially on environmental issues. I will highlight the tensions that exist between the Indonesian government and NGOs by comparing their different visions of sustainable development. From this debate, two key questions emerge:

1. How have environmental NGOs influenced environmental policy and the nature of environmental politics in Indonesia? And
2. How have environmental NGOs gained greater political space for themselves in Indonesia?

IV. ENVIRONMENTAL NGOs' IMPACT ON THE ENVIRONMENTAL DEBATE IN INDONESIA

A. Environmental NGOs are Articulating New Visions of Sustainable Development

Indonesian NGOs are articulating and giving reality to their plural and collective visions of sustainable development with some notable successes. These are visions of sustainable development that go beyond the sound environmental resource use and development principles espoused by the Government of Indonesia. In the process, NGOs are gaining greater legitimacy and political space by

A SAMPLE OF INDONESIAN NON-GOVERNMENTAL ORGANIZATIONS (NGOs) INVOLVED IN ENVIRONMENTAL ISSUES

LEVEL OF OPERATION (Roles)	NAME OF NGO (Location)	BRIEF DESCRIPTION OF ACTIVITIES
LOCAL	Yayasan Prakarsa (Yogyakarta)	An NGO involved in rural development and reforestation which has worked with villagers to plant 150,000 trees in five communities
*Grassroot Projects *Community Participation *Gain LG Support	Yayasan Tana Nua (Sumba)	An NGO involved in agroforestry, soil conservation, and upland agriculture, with a network of over 800 active farmers.
REGIONAL	YPMD (Jayapura)	YPMD is the leading NGO in Irian Jaya involved in natural resource managment and community development
*EIA Training *Monitor Projects *Mobilize Support for Issues *Joint Cooperation	Yogya NGO Forum (Yogyakarta)	A forum of over 40 NGOs devoted to sharing development information and cooperating with the provincial government. Activities include community development, small-scale enterprise, waste recycling, clean water and sanitation projects.
NATIONAL	WALHI (Jakarta)	The Indonesian Environmental Forum is a national federation of over 500 NGOs broadly involved in environmental issues.
*Information *Legal Action *Critique Policies *Policy Advocacy *Organize Campaigns	SKEPHI (Jakarta)	The Indonesian Network for Forestry Conservation conducts research and analysis on forestry management and policy issues.
	KRAPP (Bandung)	The Pesticide Action Network for Indonesia provides technical information on proper use and alternatives to pesticides
INTERNATIONAL *Watchdog over GOI Policies *Mobilize Int'l Support *Lobby Donors	International NGO Forum on Indonesia [INGI] (Jakarta and the Hague)	INGI is a coalition of Indonesian NGOs, Asian NGOs, and Western NGOs which meet annually to discuss Indonesia's development performance and to prepare alternative recommendations for Indonesia's donors

pursuing distinct strategies at four different levels (See Table 1).

1. NGOs as Catalysts for Development from Below

Local NGOs in Indonesia are undertaking grassroots development activities to alleviate poverty while promoting sound environmental practices and education about the principles of sustainable development (Hasan, 1985; Cochrane, 1984; Soerjani, 1990). By undertaking effective community development projects which offer environmental, economic and social benefits, a number of NGOs are acting as catalysts for sustainable development from below. In the process, there are signs that NGOs are incrementally gaining government officials' recognition and accountability from below. Where local NGOs have demonstrated solid results and gained the support of local officials, defacto authority has been returned to the people to participate in development decisions that concern them. Examples include:

a. CD Bethesda, which initially started its development activities in primary health care in the early 1970s. Through its work with local communities and various government agencies to improve human health, CD Bethesda has expanded its concept of human health to include environmental, economic, and social dimensions. For instance, CD Bethesda developed a unique engineering feat by tapping underground aquifers for drinking water in drought-prone areas outside Yogyakarta, thus receiving a national award from President Suharto for its work in 1979.

b. Yayasan Prakarsa in Central Java, which has organized over 500 villagers in 5 communities in reforestation efforts that have led to the planting of over 150,000 trees on degraded hillsides, public, and private lands with the support of local government officials.

c. Yayasan Tana Nua, which has trained and mobilized a network of over 800 active farmers in soil conservation measures (e.g. hedge rows, terracing, in-row tillage), agroforestry, animal husbandry, aquaculture, and upland farming practices on the semi-arid island of Sumba. The regreening of upland areas and farmers' conservation of indigenous tree species has convinced local officials to allow farmers to remain in critical watershed areas despite edicts to remove them, and to involve farmers actively in the management of these upland areas.

2. Provincial and Regional-Level NGO Forums

At the provincial and regional levels, a number of NGOs have come together collectively to conduct environmental training, monitor and critique government and private business development

projects, mobilize people's support for various issues, and seek greater participation in the regional development process. Examples of NGO forums and coalitions include:

a. The Yogyakarta NGO Forum has negotiated with the provincial government and World Bank for a possible role in the second phase of an integrated rural development project for the province. In addition, NGOs have engaged in joint cooperation with the provincial government on development and environmental projects.

b. The Lombok NGO Forum mobilized to protest the social impacts of outside speculators developing the island into the next tourist resort east of Bali. The Sengigi Beach Hotel has become the focal point of this protest. NGOs have sought to retain the rights of coastal villagers to marine and land resources in this growing tourist development area (Aditjondro, 1990b; Vatikiotis, 1990).

c. Fifteen NGOs in Central Java have Mobilized Support for the Tapak Community: The community of Tapak has been subject to industrial water pollution from 8 firms operating in the area for 14 years. Villagers claimed that direct dumping of industrial wastes into the Tapak river had killed off their local fish-farming enterprises (e.g. fish, shrimp), and polluted local groundwater supplies used for drinking. Despite water tests by WALHI (a leading national-level NGO network) and the local environmental studies center confirming high levels of pollution in the local river and public protest to the firms involved and local authorities, no action had been taken. Consequently, a coalition of 15 NGOs was formed in April 1991 to organize a national consumer boycott of the polluting firms, which finally prompted an agreement to resolve the problem (Santosa, 1991; Santosa and Hutapea 1992).

3. National-Level Federations of NGOs

At the national level, NGOs have formed environmental federations and networks to engage in information dissemination, legal action, and policy advocacy. In addition, environmental NGOs have increasingly made public comments critiquing the government's development plans and policies and proposed alternative policy recommendations both at official levels and in the press (cf. Sambodo, 1989). In some instances, NGOs have organized advocacy campaigns in an attempt to influence specific projects, programs and policies that are perceived as posing adverse impacts for the environment. National-level NGOs' strategy has been to pursue politically symbolic cases. In so doing, NGOs have challenged the government's notion of and commitment to sustainable development. The following are examples of the ways NGOs have done so.

a. WALHI Filed a Legal Suit against a Pulp and Paper Plant and Government Ministries: WALHI, a national-level federation of over 500 NGOs involved in environmental issues, working in conjunction with Indonesia's Legal Aid Institute, launched a lawsuit in late-1988 against *PT Inti Indorayan Utama*, a firm that owned a pulp and paper plant in North Sumatera, and five government agencies.[17] This legal suit was a pivotal event as it constituted the first open challenge to the government's authority by environmental NGOs. WALHI questioned the government's licensing of a large-scale industrial project without complying with its environmental impact assessment regulations.[18] The stakes proved to be sufficiently high to the government to prompt a calculated response. As Rush notes: "The state did not react lightly. During the trial, WALHI's witnesses were banned from giving evidence; senior ministers impugned WALHI's motives; and on state-controlled television, local villagers were seen refuting WALHI's evidence" (1991:39). WALHI eventually lost the case, but the court acknowledged NGOs' right to legal standing for the first time (*Kompas*, 15 Agustus 1989; Cribb, 1990).

b. NGO Opposition to the Scott Paper Project (1988-1989): In early 1989, the government announced that it had given initial approval for the largest foreign investment project in Indonesia's history. The U.S.-based Scott Paper company proposed to take part in a $654 million joint venture project with P. T. Astra International in a 550,000 ha. eucalyptus plantation and pulp mill in Irian Jaya, affecting the cultural lands of 15,000 indigenous people. The Scott-Astra project was estimated to create 6,000 new jobs and to generate exports valued at over $200 million annually (Vatikiotis and Schwarz, 1989; Aditjondro, 1990b:59). NGOs' concerns focused on local people's land rights, the environmental impact, and labor issues raised by the Scott-Astra project (Aditjondro 1988, 1990b; Vatikiotis and Schwarz 1989; WALHI 1988c, 1989).

Six Indonesian environmental NGOs mobilized on several fronts to stop the project, threatening ultimately to organize an international consumer boycott of Scott Paper.[19] The most visible act of this international campaign came when the Rainforest Action Network ran an advertisement in the New York Times highlighting rainforest destruction and the Scott-Astra project (Vatikiotis and Schwarz, 1989). Due in large part to NGO pressure, Scott Paper pulled out of the project in late October 1989 (Aditjondro, 1990b; Jakarta Post, October 23, 1989).

While NGOs may have won the battle, they may have lost the war on two fronts. Initially the government was so determined that the project would continue that it sought financial and technical support from Asian firms in Hong Kong,

Japan, South Korea, and Taiwan, who may have proven to be even less sensitive to environmental concerns and less responsive to international appeals.[20] More importantly, environmental NGOs have been closed out of the information and decision-making processes of this and subsequent large-scale industrial investment projects, thus limiting NGOs' abilities to participate in and comment on Indonesia's development projects (cf. Ansaka, 1990; Aditjondro, 1990b). As George Aditjondro pointedly argues: "The question that needs to be addressed is how can industry and NGOs meet to discuss development that is environmentally sound" (1990b:60).

c. NGOs Challenge Government Policies and Plans and Propose Alternatives: Indonesian NGOs' advocacy at the national level has not focused solely on the impact of industrial development projects on the environment, but has also raised questions about government policies and plans. In the area of tropical forestry, for instance, WALHI has publicly criticized the Indonesian National Forestry Action Plan (NFAP), calling it **"a recipe for social, economic, and ecological unsustainability"** (Halesworth, 1990:11, emphasis added). WALHI has recommended instead that Indonesia's NFAP:

> "undergo a complete restructuring and revision. The document should have as its principal objective checking deforestation and encouraging a development process in which the people of Indonesia have a decisive voice in the formulation of policy about resource use in their areas" (cited by Halesworth, 1990:11).

In its efforts to foster a participatory planning process, WALHI has worked with a number of NGOs and local communities to identify possible alternatives for sound forestry management (WALHI, 1990a, 1990e; Zulkarnaen, 1990).

d. WALHI Criticizes Plans to Save Javan Rhinos: Environmental NGOs at the national level have not pursued advocacy only for instrumental or political ends, but also for sound environmental and conservation principles. For instance, WALHI has lobbied both the International Union of Conservation Naturalists (IUCN) and the Government of Indonesia to reconsider its plan to move the endangered Javanese Rhinos to captive breeding centers. WALHI argues that "protection, not removal, is the key to the Javan Rhino's survival" (WALHI, 1990d:15). Similar efforts to move Javan Rhinos in Sumatra and Malaysia have led to high mortality rates (60 percent). To date, there has been no successful case of captive breeding of Javan rhinos. Consequently, WALHI argues for: 1) in-depth field research about the population, the condition of the habitat, and present and future threats

to the Javan Rhino; 2) identifying less risky, and more "cost-effective and sustainable alternatives to captive breeding;" and 3) "establishing a Javan Rhino fund to finance habitat protection and improvement of management of Ujung Kulon National Park in West Java" (WALHI, 1990d:13; Jakarta Post, 30 March 1991). In the process of documenting habitat destruction and proposing sound wildlife management strategies (Murphy, 1988), WALHI is gradually gaining expertise on biological conservation matters and reaching a broader constituency within the scientific community both at home and abroad for sustainable development.

In summary, environmental NGOs at the national level have selected cases strategically, often seeking cases for environmental advocacy which have potential for symbolic political value wider than the specific site and issue itself. Environmental NGOs in Indonesia have intensified the political visibility of NGOs vis-a-vis the Suharto government by 1) commenting critically on the environmental problems faced in the field, 2) establishing their right to legal standing, 3) questioning the government's pursuit of large-scale development projects, and 4) by organizing campaigns and advocating policy reforms. By influencing public policy and shaping the nature of environmental politics, NGOs are placing constraints on the state to act independently in the environmental arena.

4. Building Linkages to the International Environmental Movement

At the international level, Indonesian NGOs have built linkages to the international environmental movement. An international coalition of NGOs is being forged that consists of Indonesian NGOs, Asian NGOs and networks, as well as international NGOs from the West (especially from donor countries). The International NGO Forum on Indonesia (INGI) was initiated by several leading Indonesian NGOs in the spring of 1985 and has met on an annual basis prior to the meeting of the international donor aid consortium (Inter-Governmental Group on Indonesia or IGGI) responsible for providing foreign assistance to Indonesia. Its two primary objectives have been to "strengthen people's participation in development" (which is highlighted in every aid memoire), and to "direct its advocacy to the IGGI Conference" (INGI, 1986; Moniaga, 1989a). Since 1985, INGI's role has evolved to the point where it acts as watchdog over the government's development policies, providing an annual critique of government programs and highlighting major themes for debate. Each INGI meeting produces an aid memoire listing areas of concern for both the government and donors. It is an indigenous (Indonesian NGO) answer to the annual World Bank country report, which is prepared for the donor consortium (IGGI) that provides support to Indonesia.

Second, INGI has sought to build international linkages or political alliances in support of sustainable development in Indonesia. A sample of foreign NGOs that have attended INGI meetings includes: the Asian NGO Coalition for Agrarian Reform and Rural Development (ANGOC, Philippines), the Asian Cultural Forum on Development (ACFOD, Thailand), the Australian Council for Overseas Aid (ACFOA, a council of 90 NGOs), Christian Aid (UK), the Development Group on Alternative Policies (D-Gap, U.S.), the Environmental Defense Fund (EDF, U.S.), the Environmental Policy Institute (U.S), the Natural Resources Defense Council (NRDC, U.S.), the National Wildlife Federation (U.S), *Friedrich Ebert Stiftung* (FES, Germany), *Friedrich Naumann Stiftung* (FNS, Germany), HIVOS (Netherlands), ICCO (Netherlands), and the International Confederation of Free Trade Unions (Belgium). By providing foreign NGOs with information and a forum to mobilize joint action on development issues, INGI has given high visibility to Indonesia's development record within donor countries. Moreover, INGI meetings have been held in the Hague, Bonn, Brussels, Washington, and most recently in Tokyo. In the process, INGI has identified supportive partners within the international environmental movement and, to a lesser extent, the international donor community.

Finally, INGI has placed collective pressure on key actors for accountability by submitting its aid memoire to the IGGI, the World Bank, and other multi-lateral and bi-lateral donors. Aid memoires have commented on:

- Indonesia's Development Policies:
"Responsible development policies must be economically, environmentally and socially sustainable. INGI is concerned that Indonesia's development policies are concentrating too much on economic growth, resulting in the depletion of natural resources, and the concentration of wealth and economic power" (INGI, 1990:4).

- The Government's Development priorities:
"Funding for forestry plans emphasizing foreign exchange earnings and for nuclear power generation...should be given lower priority than projects which provide natural resources and energy for local communities, and to support community control of resource management policies" (INGI, 1990:5)

- Indonesia's Transmigration Program:
INGI's statements about the Transmigration Program have focused on its impact on tropical forests and indigenous peoples, the need for models of agriculture and forestry that are ecologically sustainable, and have questioned World Bank support for this scheme (INGI, 1986, 1991).[21]

• Donor Funding of the Environment:
"INGI...recommends that ...[donors] increase their funding for environmentally beneficial projects which will directly benefit small communities, support conservation of critical ecosystems, and support projects which encourage biological diversity, and projects which present alternatives to large-scale rainforest projects" (INGI, 1989:6)

• The Kedung Ombo Dam Project in Central Java:
NGOs have criticized the government due to its forced resettlement of local peoples, its lack of a comprehensive environmental or social impact assessment, and its denial of human rights violations perpetrated by the military. NGOs have also questioned the World Bank's support and oversight of the project (INGI, 1988, 1989; Paterson, 1987).

• Human Rights:
INGI statements have specifically raised concerns about the government's detention of students, repression of demonstrations, and its restrictions on trade unions (INGI, 1989). Subsequent statements have focused on worker's rights to organize and form independent trade unions (INGI, 1990, 1991).

• Economic Democratization:
INGI has sought to counter concentration of economic power of conglomerates by proposing that the government adopt anti-monopoly and anti-trust laws, and a small business act (INGI, 1991).

• Political Democratization:
Specifically, INGI has raised concerns about the protection of human rights, the role of military and its accountability, and the direct election of local representatives (INGI, 1991)

• Democratization of International Development Aid:
INGI seeks the full participation of people in the planning and implementation of donor-aided projects and program for a number of key development sectors (e.g. agriculture (INSUS), social services, forestry). In addition, INGI has requested full access to information regarding the development plans and projects of international donor agencies as well as the Indonesian government (INGI, 1990, 1991).[22]

Given the high visibility of these issues, representatives of INGI have gained audiences with the IGGI, the World Bank, and other donors to the chagrin of the Suharto Government.

5. The Growing Challenge of Indonesia's Environmental NGOs

Indonesia's environmental NGOs are putting pressure on the government not only domestically, but also internationally. By building linkages with and mobilizing support among environmental groups in the U.S., Europe, and most recently Japan, and the international press, Indonesian NGOs are raising questions about the direction of environmental management and sustainable development in Indonesia. The political legitimacy and leverage gained through international alliances has increased the political space for environmental NGOs within Indonesia to comment not only on environmental and development issues, but political liberalization and democracy. Consequently, when NGOs' strategies at the micro and macro levels are viewed together, they suggest that Indonesia's NGOs represent a considerable political force that the central government must contend with in determining the direction of sustainable development in Indonesia in the future.

B. A Shift in NGO Tactics or Actual Gains in NGOs' Political Space?

Skeptical observers might ask are we merely seeing a shift in NGO tactics or have NGOs actually gained greater political space for their activities? Whereas previously NGO leaders would self-censure their words and actions to avoid upsetting the government (cf. Rush, 1991), by 1990 they were making increasingly outspoken and frank criticisms of the Suharto government, especially for Indonesia's Javanese political culture. At a national-level seminar on "Motivating Private Sector and NGOs' Participation in Environmentally Sound and Sustainable Development" sponsored by Emil Salim's Ministry of Population and Environment in September 1990, NGO activists and social critics hijacked the agenda contending that democracy was essential to achieving sustainable development in Indonesia. Adi Sasono, a leading NGO activist, argued that "the key issue to sustainable development is how to create a [political] system in which the public would assume the role of social control" because the ruling elite in developing countries do not have a "vision and effective political commitment" to environmentally sound and sustainable development. Sasono concluded that "democracy is needed within the framework of promoting people's participation, as development is not only a state project" (Jakarta Post, 27 September 1990). Whether they were merely changing their tactics or emboldened by their growing political space, NGO leaders were not afraid to speak out on politically sensitive topics and challenge Indonesia's prevailing political order.

V. HOW HAS THE GOVERNMENT RESPONDED TO NGOs' INCREASED POLITICAL ROLE?

A. Political Space and the NGO Movement

Have Indonesian NGOs' efforts to expand their political space gone too far in the eyes of the Suharto government? State Minister for Population and Environment Emil Salim clearly delineated the boundaries of the state's threshold for tolerance in an interview with a leading social science journal in 1983, stating:

> "It is inappropriate to suggest that government and NGOs are confronting each other. As long as the differences concerns problems of implementation, then the NGOs' right to exist is guaranteed. But if the differences concern more 'philosophical' differences in ideology or differences in national aims, then clearly **any NGO with those sorts of differences with the government will not have the right to exist**" (E. Salim, 1983a:71; emphasis added).

Since 1983, enormous changes have occurred where NGOs have pushed the boundaries of acceptable conduct. While the government publicly claims that NGOs have little or no influence, the reality is that NGOs are walking a fine line and actually widening the political space for action. Due to the growing NGO challenge to its authority, the Government of Indonesia has directly or indirectly sought to undercut NGOs' political space by: 1) taking legal measures to limit NGOs' actions, 2) issuing threats and warnings, 3) re-asserting government control over the environmental arena, and 4) undercutting NGOs' international linkages.[23] Each of these points is elaborated on below.

1. The Government of Indonesia Has Taken Legal Measures to Place Controls on NGOs' Activities

• For example, the Law on Social Organizations enacted in 1985 gives the Government of Indonesia the authority to ban and dissolve social organizations such as NGOs (Witjes, 1986; Billah and Nusantara 1989; Eldridge, 1989). This legislation provoked much debate about whether it would limit the political space of NGOs and other organizations to operate. Mohammed Natsir, a former Prime Minister of Indonesia from 1950-1951, who commented on the draft Law on Social Organizations in July 1984, argued that:

> "...the rearrangment which occurred in the New Order in the field of political power... **has resulted in paralysis and increasing narrowness of room for manuever by non-governmental social and political organizations.** This is being done step by step, systematically and unyieldingly (Natsir 1985:1, emphasis added)."

While few NGOs have been actually banned to date, the legislation is often invoked by government officials when questioning NGOs' motives and conduct.

• In 1990 the Minister of Home Affairs issued a directive to the heads of all provincial, district, and municipal governments to conduct an inventory of all NGOs operating within their jurisdiction. All NGOs were required to re-register with the government and provide details about their sources of financial support, their board and staff members, and their development activities. A spokesperson for the Minister of Home Affairs, Amur Muchasim, pointedly stated: "This instruction is not intended to limit NGOs' space... or even to silence NGOs. This instruction benefits NGOs" (*Suara Karya*, 11 Juli 1990).

2. The Government of Indonesia Has Issued Threats and Warnings to NGOs to Curb their Advocacy Role

• One of the best examples is the INGI affair of 1989. In August 1989, the Minister of Home Affairs met with 13 major NGOs to discuss the government's concerns over a memorandum to the World Bank prepared at the INGI conference in Belgium in April 1989. The aid memoire criticized the government on environmental and human rights grounds for its handling of the Kedung Ombo Dam Project in Central Java funded by the World Bank. NGOs were called "unpatriotic" for soiling the name of nation abroad.[24] In their private meeting with the Minister of Home Affairs, NGOs were warned "to stop influencing overseas opinion or face prosecution or banning" (Vatikiotis, 1989a:23). This reaction at the national level prompted increased government scrutiny of NGOs especially at local levels. Many NGO officials outside Jakarta were subjected to intimidation and harassment, and thus have self-censured their behavior and activities to avoid any semblance of being too "political."

The NGOs' aid memoire prompted a review of the Kedung Ombo Project by the World Bank, thus putting the government on the defensive. A bank official admitted that this and similar episodes in other countries has led the World Bank to change its procedures for consulting with concerned parties (including NGOs) before proceeding with major development projects.[25]

• NGOs' strategy to publicize highly visible environmental cases both at home and abroad was clearly challenged by the government in November of 1989. State Secretary (General) Moerdiono, President Suharto's principal spokesperson, pointedly warned NGOs to stop engaging in politics and using the environmental arena as a camouflage for their activities, stating that: "**...environmental problems must not be abused for political ends**," and should be addressed at home not aired abroad (*Kompas*, 18 November 1989, emphasis added).

• Prior to the INGI meeting in Bonn in April 1990, leading NGO officials met with Minister of Home Affairs Rudini who impressed upon them the government's concern that they conduct themselves properly while abroad.

• In August 1990, a District Military Command suspended the operations of an NGO working in Northern Sumatera that was instrumental in bringing attention to the pulp plant case at the national level (Asia Watch, 1990). Joint action by NGOs at the national level combined with central government support led to the local NGO's reinstatement.

• Even moderate voices who have supported an expanded role for NGOs have expressed their concerns to NGOs to temper their pressure group tactics. Gadjah Mada University's former rector, Koesnadi Hardjasoemantri, who has championed NGOs' role in the environmental arena, told NGO officials in Yogyakarta in March 1990: "Don't push too hard, or the door will close. Indonesia is different than the West."

3. The Government of Indonesia has Sought to Re-Assert Its Control over the Environmental Arena

• The Government of Indonesia has encouraged the formation of environmental NGOs that support its positions (i.e., government-sponsored NGOs) and can mount a counter-public relations campaign domestically to that put forward by independent, activist-oriented environmental NGOs. For instance, the Environmental Management and Information Center (PIPLI) was set up in 1988 by the Indonesian Chamber of Commerce to focus on waste water treatment for industry, and annually presents awards to 45 firms it considers most "environmentally friendly" (Jakarta Post, 23 April 1991).

• To counter "bad" press abroad about deforestation and Indonesia's mis-management of the forestry sector (promoted by international environmental NGOs), a press campaign has been conducted in the U.S. and Europe claiming that Indonesia's tropical forests are managed in an environmentally sound and sustainable manner. A leading Chinese businessman in the forestry sector who has close ties to the regime, Mohamad (Bob) Hasan launched the $2 million public relations campaign (developed by a U.S. consultant) with the support of the national council of timber producers (APKINDO) (Anon., 1990; Schwarz, 1990).

• The Ministry of Population and Environment published its first annual status report on Environmental Quality in Indonesia in 1990. While baseline data on the environment is critically needed in Indonesia, this action was interpreted by NGOs as a government attempt to counter NGOs' publications and statements in the press about the state of the environment.

• The Government of Indonesia has sought to undercut NGOs legitimacy in the environmental arena by impugning their commitment to national progress and challenging their expertise and professionalism in the press (cf. *Kompas*, 11 Januari 1990).

• Seeking to reduce NGOs' role in exposing pollution cases, the Government of Indonesia announced in June 1990 its decision to establish an Environmental Control Agency (Bapedal) and to enforce its industrial pollution regulations aggressively. By mid-November of 1990, 738 companies in East Java alone were cited for various pollution violations (Kompas, 19 November 1990). What finally prompted the Government of Indonesia to act? In an interview with WALHI officials, an Assistant Minister for the Environment, Nabiel Makarim, admitted that:

> "Increasing NGO pressure and a new regulation empowering the public to sue the government for mismanagement and breaking its laws make it imperative that the Environmental Control Agency [*Bapedal*] move rapidly and carefully" (WALHI, 1990c:12).

4. The Government of Indonesia has Sought to Undercut Indonesian NGOs' International Linkages

• In March 1991, the Government of Indonesia threatened to withhold visas and exit permits for NGO officials who were planning to attend the Seventh Annual INGI Meeting in Washington, D.C.[26] A blacklist was revealed and some members of the NGO delegation were threatened with the prospect of not being granted exit permits, until the government acquiesced at the last minute.

• In March 1992, the Government of Indonesia adopted new regulations banning the re-entry of any Indonesian citizen who speaks critically of the government while abroad. The timing of this legislation appeared to be more than coincidental, as it was adopted three weeks before the Eighth INGI Meeting was scheduled to be held in Japan. Because the Japanese Government is the largest provider of Indonesia's development assistance, the Indonesian government was duly concerned that such an international forum would prompt greater scrutiny of its development record.

• On March 25, 1992, the Government of Indonesia announced its decision to suspend its meeting with the IGGI, the donor aid consortium for Indonesia. Six days later, the Government of Indonesia ordered the Dutch government to leave the country. While the government's reaction can be partly attributed to Indonesian sensitivities about the East Timor massacre when the Dutch, Canadian, and Danish governments suspended aid to Indonesia, the Indonesian government is also seeking to limit further scrutiny of its development and human rights record. This is a significant political act as Indonesia received U.S. $4.75 billion in aid for fiscal year 1991/1992. The Government of Indonesia asked the World

Bank to reconstitute an aid consortium -- but the message is clear -- donors will be asked not to question Indonesia's politics and development priorities in the future.[27]

• On April 28, 1992, the Government of Indonesia banned all NGOs from receiving aid from the Netherlands. It is estimated that this action has led to the loss of about $15 million in aid to Indonesian NGOs (van Tuijl, 1993). The Minister of Home Affairs, Rudini, stated that with the dissolution of the IGGI, the International NGO Forum on Indonesia (INGI) was no longer needed nor relevant and should cease to exist. INGI responded that it will continue as long as the issues of sustainable development, social justice and people's participation in Indonesia's development remain salient.[28]

VI. CONCLUSIONS

A. How will the Controversy over Sustainability Play itself Out in Indonesia?

The dismissal of Brazil's environmental secretary, Jose Lutzenberger, two months prior to hosting the Rio environmental summit underscores the difficult balancing act which governments face if they seek to present a progressive "green" face to the world community, enlist the support of domestic environmental interests, and still satisfy their own political and development agendas.[29] In March 1993, Emil Salim faced a similar fate as his Brazilian counterpart as Sarwono Kusumaatmadja was selected by President Suharto to succeed Salim in the new Cabinet as the Minister for Population and Environment. While Kusumaatmadja is known to be progressive in his development orientation,[30] he lacks the international stature and the linkages to both international development agencies and Indonesian NGOs that Emil Salim had cultivated in attempting to build a "new [national] consensus focused upon sustainable development."[31] Clearly Indonesian NGOs have established themselves as an effective constituency and a key actor for institutionalizing sustainable development within Indonesia (Salim, 1987; Walker, 1991). Thus, it remains to be seen whether the Suharto government has lost the one voice and advocate who could lead it to accommodation with NGOs, and direct the government on a genuine, collaborative path for sustainable development.

B. The Politics of Sustainable Development in Indonesia

By embracing the concept of sustainable development the Government of Indonesia has opened a pandora's box.[32] The Suharto government has sought to give lip-service to the main development concept of the 1990s and show its enlightened attitude to the outside world, especially the international donor community. It may also be seen as an attempt to coopt the term used by voices within Indonesia who seek to realize its vision. Yet it has proven

to be a double-edged sword as NGOs working on the environment, community development, and human rights press the government to be accountable and live up to the vision of sustainable development. Indonesia's environmental NGOs are more than just a response to pressing ecological concerns, but may be a force for restructuring politics within society. By expanding the sustainable development discourse to include environmental, development, social justice, and democratization issues, NGOs have brought critical political issues about the structure of Indonesian society and power relations within it to the fore. Due to their strategic articulation of issues and mobilization of support, environmental NGOs have gained greater political space and changed the nature of environmental and development politics in Indonesia. By linking development from below to the international environmental movement, Indonesian NGOs are strengthening their legitimacy as actors in civil society and the development process, fundamentally changing the nature of their relations with the Indonesian government. Thus, I want to underscore again that NGOs represent the first signs of pluralism in authoritarian Indonesia in over 25 years.

Under the banner of sustainable development and environmentalism, Third World NGOs are seeking and gaining political space. In fact, many NGOs' pursuit of the sustainable development agenda has been reinforced by some progressive international donors to the chagrin of Third World governments. As the initial cases of Malaysia and the Philippines have suggested, Third World governments too are responding in different ways to the NGOs' challenge, hard pressed to show that they are indeed committed to sustainable development. In the process of gaining greater political space for themselves, NGOs have identified governments' achilles heel. That is, a government's "inability to provide for the sustainable well-being," social justice, and participation of people in the development process is at issue (Fowler, 1991:78). This juncture has provided NGOs with an opportunity to act independently and to challenge government itself. Though NGOs have pursued their strategy in an instrumental manner through the environmental arena, it does not in anyway discount the relevance and magnitude of the environmental crisis, the need to reconcile environment and development conflicts, and ultimately the need to develop politically viable models of sustainable development.

NOTES

1. An earlier version of this paper was presented to the Fifth Annual Conference of the Northwest Regional Consortium for Southeast Asian Studies, October 16-18, 1992, University of British Columbia, Vancouver, Canada.

Part of this research has been supported by a Fulbright-Hays Fellowship from the U.S. Department of Education. I am grateful to Norman Uphoff and Rosalind Grigsby for comments on an earlier draft, and to George Aditjondro and Smitu Kothari for thoughtful discussions on this topic.

2. The first quote is attributed to Prime Minister Mahathir, while the second comes from Federal Territory Minister Abu Hassan. The main NGOs singled out by these two government officials during this period include *Aliran*, the Bar Council, the Consumers Association of Penang (CAP), the Environmental Protection Society of Malaysia (EPSM), and the Selangor Graduates Society (Aznam 1987a:16-18; 1987b:19-20; Mauzy 1988:217, ff.10; McDowell 1989:321).

3. NGO officials from the Environmental Protection Society of Malaysia (EPSM), the Perak Anti-Radioactive Committee, and *Sahabat Alam Malaysia* (SAM - Friends of the Earth Malaysia) were among those detained (Boon Kean and Singh 1991).

4. The predominant focus of this study is on indigenous non-governmental organizations (NGOs) and their relations with government. Thus, for the purposes of this paper, the term NGO refers to "indigenous" NGOs unless specifically noted to include "foreign" or "international" NGOs.

5. This section draws directly from my earlier work (Riker 1990).

6. For some notable exceptions within the context of African politics, see Holmquist (1981), Barker (1987), and Chazan (1992).

7. I am indebted to George Kahin on this point.

8. As Durning argues: "The fundamental questions of sustainable development are, *By whom*? and *For Whom*? Sustainable development imposed from high is rarely sustainable; it may not even be development" (1989:32-33, original emphasis). In addition, others have questioned the quality of economic growth pursued in the name of sustainable development, asking who decides what that growth shall be? (Smitu Kothari, pers. comm.).

9. Lynton Caldwell has persuasively argued that three political conditions must be satisfied before ecological sustainability can "become an objective of national policy and development planning" (1984:305). It requires 1) "a politically effective constituency for such a policy," 2) governmental decision-makers who "have an

incentive to favour long-range ecologically sustainability over short-range considerations," and 3) "an ecological-ethical ideology with explicit political expression" to mobilize "sufficent numbers of people to set the course of national policies" (1984:305).

10. Forest products are second only to oil exports in generating foreign exchange for Indonesia's economy, accounting for $2.5 billion in 1987 (World Bank, 1990:1).

11. Emil Salim has written a number of pieces that deal with the concept of sustainable development and policies to promote its implementation in Indonesia (Salim 1986, 1987, 1988, 1991).

12. Interview with an official of the U.S. Agency for International Development, Jakarta, in November 1989.

13. The Government of Indonesia has since recognized the need to give teeth to its environmental ministry and enforce its environmental legislation. In June of 1990, the government announced the creation of an Environmental Control Agency (*Bapedal*) with offices at the provincial level responsible for environmental management. However, due to human resource and institutional constraints, it will take some time before these offices are likely to have a significant impact on environmental matters.

14. Some observers felt that the environment should not be the sole domain of NGOs and a weak environment minister. As an editorial on Earth Day in 1990 stated:

> "We cannot afford to take the attitude that the problem of environmental protection is something to be left to non-governmental organizations with little else to do, or that it is the sole concern of a particular state minister, whose presence is advantageous only because it gives Western countries the impression that we in Indonesia are also sensitive towards issues which are their concern" (Jakarta Post, April 13 1990, page 4).

15. For instance, a national environmental federation known as WALHI (the Indonesian Environmental Forum) which was formed by 79 NGOs in October 1980 grew to over 320 NGOs by May of 1983 (Witoelar 1984b).

16. As one Indonesian environmental NGO official was quoted:

> "The only way to be anti-Suharto is through the environmental movement... There is no other way to talk about Suharto or human rights" (Newsweek, 1991:45).

17. WALHI's suit was filed in the names of five government officials, including cabinet-level ministers and their ministries. Even Emil Salim, Minister of Population and Environment, was named

in the lawsuit (Cribb, 1990). In Javanese political culture, this action was a personal affront to those in power which was unprecedented. Some sympathetic observers viewed this pressure group tactic to be inappropriate and ultimately ineffective that would only subject NGOs to the government's wrath (cf. *Kompas*, 21 Oktober 1989).

18. For further background on this pulp plant case, see also Santosa (1987, 1989), Walhi (1988b, 1990b), Dodd (1989), Moniaga (1989b), Naggao (1989), and Cribb (1990).

19. The main NGOs involved included: YASANTO at the local level in Merauke; YPMD at the provincial level; SKEPHI, which played the main coordinating role, with WALHI, the Indonesian Consumers Institute (YLKI), and the Indonesian Legal Aid Institute (YLBHI) at the national level; and the Rainforest Action Network and Survival International at the international level.

20. By late 1990, the Government of Indonesia had asked Astra to proceed with the project and assigned P. T. Perhutani [Inhutani II], a governmental corporation for timber plantations under the Department of Forestry, to serve as Astra's joint partner in this venture. However, by September 1992, the government announced that it was pulling out of the project.

21. At the national level, SKEPHI, the Indonesian Network for Forestry Conservation, has been the most vocal advocate for sustainable forestry practices and indigenous people's rights, portraying the government's resettlement efforts as an effort to Javanize Indonesia's eastern islands.

22. These same concerns for full disclosure and transparency in international aid have been picked up and echoed more broadly in the Indonesian press. As an editorial in the Jakarta Post in May 1990 stated:

> "We might also add... another point which an impartial international organization such as the World Bank may perhaps find it imprudent to suggest: that those Indonesians, still in a disadvantaged situation, also be given better access to the sources of information and that they be given a more direct and participatory role in their country's political processes. This is important, because **only when the majority of Indonesians are truly part of the economic, social and political systems -- only then can there be hope for truly sustainable national progress**" ("Sustaining Progress," Jakarta Post, May 22, 1990, page 4, emphasis added).

23. I do not want to give the impression that the government's response to NGOs has consistently been to undercut NGOs' political space. In fact, there have been some signs that the Indonesian

state has not been monolithic in its response to NGOs. Three cases in particular illustrate this point.

First, leading NGO activists themselves recognize that within the government there are supportive officials who can further NGOs' environmental and development objectives. As WALHI's first executive director, Erna Witoelar, stated in 1983: "There is no lack of sincere and broad-minded government officials, and it only beneficial to the environmental movement that we join forces with them to fight the same war, even in different battles and using different tactics" (1984a:417).

Second, in December 1987, Cabinet Secretary Moerdiono stated that many NGOs have proven themselves to be "a national asset." He added that: "The Government, in principle, supports the development of NGOs, because the Government considers NGOs a partner in the nation's development efforts" (*Antara*, 14 Desember 1987).

Third, even when Emil Salim and his ministry were named in a WALHI's lawsuit, he stressed that NGOs may remain independent and critical of the government as long as they are not "political," otherwise NGOs "will not have the right to exist" (*Kompas*, 1 Juni 1989). The interpretation of many NGO officials I interviewed is that what Salim means is that any NGOs which challenge the legitimacy and authority of government "will not have the right to exist." In fact since 1988, Emil Salim has encouraged NGOs to file suits in environmental pollution cases on technical grounds, and has continuously argued that NGOs still have a valuable and constructive contribution to make in Indonesia's development.

24. This statement is attributed to General Try Sutrisno (*Kompas*, 7 Agustus 1989), who served as head of the Indonesian military at the time and is now Indonesia's Vice President.

25. Interview with Willem Struben at the World Bank, Jakarta, in December 1989.

26. This was not the first time leading NGO officials faced the prospect of being denied their "right to freedom of movement." In April 1986, the Government of Indonesia refused to grant an exit permit to Mulya Lubis, head of the Indonesian Legal Aid Institute (YLBHI), to attend the Second Annual Meeting of INGI at Langelaan in the Netherlands (Brunton 1986:31).

27. The new aid consortium convened by the World Bank is known as the Consultative Group on Indonesia (CGI).

28. Despite increased government pressures to dissolve INGI, only one Indonesian NGO has withdrawn from INGI to date (van Tuijl 1993:6).

29. Lutzenberger is an outspoken critic of deforestation and toxic pesticide use in the Amazon who openly questioned whether any further international aid for environmental protection in Brazil would make any difference given an often overburdened and corrupt bureaucracy (Hecht and Cockburn, 1992).

30. However, the choice of Kusumaatmadja should primarly be seen as an attempt to select a loyal government insider who is not likely to promote an independent agenda on environmental and development issues. He previously served as Secretary General for the state's ruling functional group of GOLKAR in the mid-1980s, before becoming State Minister for Control of the State Apparatus from 1988 to 1993.

31. This phrase comes from Emil Salim's piece on "Institutionalizing Sustainable Development" (1987:4).

32. As I have argued, the issues of sustainable development are more prominent in Indonesia than anywhere else in Asia, where population, land, and food pressures on Java, the transmigration program, and tropical forestry dominate the Government of Indonesia's ongoing development plans.

COGNITION IN CONTEXT: REVITALIZING BUREAUCRATIC POLITICS IN FOREIGN POLICY ANALYSIS[1]

Brian Ripley

Department of Political Science

University of Pittsburgh

Pittsburgh, PA 15260

Prepared for presentation at the 89th Annual Meeting of the American Political Science Association, Washington, DC, 2-5 September, 1993.

ABSTRACT

What is the status of "bureaucratic politics" in foreign policy analysis? The approach is subject to criticism by rational revisionists who wish to revive the rational actor model. Alternately, bureaucratic politics may wither on the vine in the face of a different approach (cognition) which tends to view it as a competitor or, worse, superfluous in explaining foreign policy decisions.

Foreign policy analysts should be interested in what bureaucrats do, how they do it, and why they adopt particular strategies of bargaining, persuasion, advocacy, and cooperation. This involves an analytical shift from reasoning about the problem to reasoning about the process. The theoretical foundation for a revitalized bureaucratic politics can be supplied by social cognition (schemas, scripts, impression management) and organizational culture (artifacts, values, widely-shared assumptions). The essential features of each approach complement the existing literature on bureaucratic politics.

The Johnson administration's reaction to the Tet Offensive helps illustrate the concepts of "bureaucratic roles" (how participants see themselves and others contributing to the decision process), "procedural scripts" (the routines, strategies, and premises that structure a decision process) and "cultural rationales" (symbols and traditions that define appropriate behavior and give meaning to bureaucratic interactions).
KEY WORDS: bureaucratic politics; foreign policy; organizational culture; presidential advising; social cognition; Vietnam.

Introduction

Can the study of "bureaucratic politics and foreign policy" survive the next generation of foreign policy analysis? A concerted effort to diagnose problems in Graham Allison's (1969, 1971) classic work on bureaucratic politics is long overdue, and must be undertaken in order to revive the study of organizational decision-making in foreign policy. Unfortunately, recent prescriptions would kill rather than cure the patient. On the one hand are revisionists hoping to breath new life into the rational actor model, thereby rescuing Allison's "straw man" from unwarranted rejection. On the other hand are scholars who approach foreign policy from the perspective of cognitive psychology. While not hostile to Allison's approach, this recent work emphasizes individual reasoning with little attention to the institutional context. Suspended somewhere between two active research programs, bureaucratic politics has fallen on hard times.

Bureaucratic politics should be revitalized as an approach to foreign policy analysis. The rational revisionists lead us down the wrong path. They ignore pivotal insights about the reasoning processes underlying the "pulling and hauling" of foreign policy advisors. The cognitive approach is more promising, but incomplete. While most applications of cognitive psychology focus on individual reasoning about foreign policy problems, we lack an adequate understanding of how decision-makers reason about the foreign policy process.

In this chapter I propose a set of research questions for bureaucratic politics drawn from the literature of social cognition and organizational culture. The Johnson administration's response to the 1968 Tet Offensive provides examples for this renewed research agenda. Ultimately, a revitalized bureaucratic politics perspective can help foreign policy analysts place cognition in context.

Rational Revisionism and Cognitive Isolationism

Allison's three models of the Cuban missile crisis have been a familiar feature in the foreign policy literature for more than two decades. His original purpose was to provide alternative (perhaps complementary) analytical "cuts" at the same crisis, thereby demonstrating the significant impact an analyst's choice of assumptions has on his or her explanation of an event.

Model I ("The Rational Actor") summarizes classical realist thinking (circa mid-1960s), considered the dominant paradigm among foreign policy intellectuals and practitioners alike. According to Allison, "rationality refers to consistent, value-maximizing choice within specified constraints" (1971:30). Model I follows the economist's standard logic of payoffs, utilities, and preferences among fixed alternatives.

Allison's second model ("Organizational Process") depicts foreign policy as the output of large "semi-feudal, loosely allied" organizations. Grounded in the "Carnegie school" of organizational behavior, Model II emphasizes the difficulty of coordinating responses by quasi-independent agencies, the central role played by rigid organizational routines, and the pervasiveness of incremental, "satisficing" solutions to foreign policy problems.

Finally, Model III ("Governmental Politics") builds on the metaphor of a "game" played by high-ranking officials, such as a president's top foreign policy advisors. Better known as "bureaucratic politics," this model depicts foreign policy as the result of competitive maneuvering and compromise by decision-makers who interact frequently, know each other well, and hold different beliefs about policy. The principal assumptions of Model III appear complex and idiosyncratic compared to the blissful simplicity of the rational actor model. Likewise, the constant conniving and bone-crunching combat inherent in bureaucratic politics stands in marked constrast to the routine incrementalism of organizational processes. Allison's provocative Model III is the primary subject of this chapter.

From the outset, Model III attracted a great deal of critical attention from foreign policy analysts (e.g. Art 1973; Ball 1974; Caldwell 1977; Freedman 1976; Krasner 1972; Perlmutter 1974; Rosati 1981; Smith 1980). The critics relied on a several recurring themes: Model III was not particularly new, its methodological status was open to question, it raised uncomfortable normative implications about democratic accountability in foreign policy, it underestimated the role of the president, and the case study was based on questionable evidence.

Recent appraisals (Bendor and Hammond 1992; Welch 1992) highlight many of the same concerns. The new critics have produced persuasive reinterpretations of bureaucratic politics, highlighting problems with the logic, concepts, and historical accuracy of Allison's work. They go a step further, however, with an explicit call to reinstate the rational actor model as the model of choice in foreign policy decision-making. Taken seriously, these "rational revisions" would result in an impoverished conception of organizations that removes the "essence" from the Essence of Decision.

Welch's (1992) critique is an exercise in retrospective rationality. The comfortable combination of hindsight and access to the archival record raises questions about Allison's version of the Cuban missile crisis. In some cases, Allison got his facts wrong such as the false claim that Kennedy ordered the removal of Jupiter missiles from Turkey prior to the onset of the crisis (Welch 1992: 135). More often, Welch argues, aspects of the missile crisis can be reinterpreted and reclassified to fit a rational actor model.

For example, Allison claims decentralized organizational routines help explain why the Soviets simultaneously undertook a number of operations that later proved to be complicated and, perhaps, counterproductive. Instead of organizational routines run amok, Welch argues, the simultaneous pursuit of complicated actions was a rational Soviet response to the need for speed (p. 145). Thus one way to preserve the rational actor explanation is to claim that almost anything can be considered rational from some vantage point. Ex post facto, rationality is everywhere.[2]

Bendor and Hammond (1992) rely on high technology to produce a new, improved rational actor model. According to these authors, Model I is "too thin", and Model III is "too thick" (p.318). Given this formulation, one might expect Model II to be "just right", but it is also found lacking. They urge us to embellish Model I, make Model II more rational, and ignore most of Model III.

Bendor and Hammond claim Allison's Model I rests on a simplistic, inadequate understanding of game theory and rational choice models (pp. 305-309; p.319). As a result, "rational choice models were not given a fair test" in comparison to Model II and Model III (p.319). In their effort to recreate Model I, the authors lift a page from The Wizard of Oz. Allison's rational actor "straw man" could function if it only had a brain. Bendor and Hammond set out to create one. According to the authors, "one can easily construct a far more complex rational actor that better reflects the complexities of real decision makers and the choice situations they confront" (p.305). A number of innovations in game theory, apparently unknown to Allison, allow modelers to incorporate factors such as incomplete information, multiple goals, and differential time horizons in their analyses (p.305-307). As a result, Bendor and Hammond's rational actor is less informed, less certain, and more introspective than his cocksure predecessor.

While this methodological move holds promise, it also strikes at the heart of the revisionists' dilemma: how to construct a more complex rational actor that still retains a core of simple assumptions? The complicated problem of "incomplete information" illustrates the dilemma. Allison's Model I does not account for the problem of partial or incomplete information. Fortunately, "much of the frontier work in game theory has addressed the issues of incomplete information about another player's preferences and imperfect information about a player's past actions" (Bendor and Hammond, 1992:307).

Once started down the path of "incomplete" information, however, it seems nearly impossible to capture the essential features of this concept without severely damaging the integrity of the rational choice model. For example, does "incomplete" information involve distribution within the decision group? Should one consider only the information shared by all members of ExComm? What about private information shared between John and Bobby

Kennedy? What about the source of the information? Is limited information from a credible source more "complete" than a large amount of information from a less credible source? What about conflicting information -- perhaps incompatible findings produced by different bureaucratic agencies? Is information "complete" when decision-makers are saturated with it, even though it represents only a subset of the universe of relevant information?[3]

Similar problems arise with Bendor and Hammond's treatment of multiple goals, "patience," and "uncertainty" (p. 306). Goals may be an afterthought, with little impact on setting the agenda or driving the decision process (Anderson, 1981; Anderson 1983; Cohen, March, and Olsen 1972). Bendor and Hammond's discussion of "uncertainty" assumes decisionmakers seek information about questions that could, in principle, be answered. Instead, policymakers expend considerable energy defining and interpreting problems that are more appropriately labeled "ambiguous", based on alternative ways of thinking about the same problem (see March and Olsen, 1976; Feldman,1989).

In the Cuban missile crisis, for example, the question of whether the missiles were "operational" is an example of uncertainty; either they were or they were not (e.g., Garthoff, 1989:202-203). On the other hand, Robert McNamara's famous statement that a "missile is a missile" illustrates a fundamental source of ambiguity in the missile crisis (Allison, 1969:714; Garthoff, 1989:44; Sylvan and Thorson 1992; Voss and Dorsey 1992:23). When should "defensive" missiles be considered "offensive?" Did the presence of Soviet missiles in Cuba alter the (vaguely defined) "strategic balance", given comparable U.S. missiles in Turkey? No amount of additional information would resolve the ambiguity. Ambiguity <u>can</u> be resolved arbitrarily by decision makers (and often is), but no rational formula exists to accomplish this task.

Appeals to scientific standards of parsimony and prediction cannot rescue the rationalists. Rational choice theory, reformulated or not, fails to meet this standard. The authors concede that even in the most familiar 2x2 game, "predicting the outcome of chicken is by no means trivial. <u>Any</u> of the four outcomes could plausibly occur" (p. 308, emphasis in original). What, in fact, do Bendor and Hammond predict with their new Model I? Actor goals and preferences are assumed, the decision premises are imposed, and the outcome is either known in advance or indeterminate. This might count as an explanation by some definitions, but it hardly takes the world of "prediction" by storm.

In fact, the "problem" with Allison's work is that the provocative hypotheses it generates do not lend themselves to testing with the economist's limited arsenal of techniques. The revisionists are waging a battle in which thick questions are

pitted against thin techniques. Allison's models are merely caught in the crossfire. Given the choice, we should maintain a rich, nuanced understanding of organizations and search for new, more appropriate methods. Rational choice theory and its accompanying techniques are rapidly approaching the point of "diminishing marginal utility" in the study of organizations. Any self-respecting rational actor would quit while it was ahead. If not, Allison can hardly be held accountable for its failure.

Tinkering with rational choice theory -- trying to put a new engine in the old Model I -- is a harmless enterprise. Perhaps with some new tools, a couple of short cuts, and hearts full of hope one can squeeze a few more miles out of the rational choice approach to organizational behavior. But surely the effort to fix up Model I should not come at the expense of Models II and III. If taken seriously, the call for rational restructuring of the second two models would produce an arid, excessively narrow interpretation of what actually happens in foreign policy decision-making.

Fortunately, there is an appealing alternative to rational choice theory. The "foreign policy decision-making" perspective continues to attract followers who (literally) desire a thinking person's approach to foreign policy analysis. The intellectual boundaries of this perspective vary but most who adopt it seek to explain the foreign policy decision-maker's own "definition of the situation" rather than accept a one-size-fits-all model of rationality (e.g. Snyder, Bruck, and Sapin 1954; Sylvan and Chan 1984; Vertzberger 1990; Ripley 1993). Foreign policy decision-making has received a considerable boost in recent years from the interdisciplinary "cognitive revolution" in academia (George 1979:98; Herrmann 1988). In the midst of all the excitement, however, bureaucratic politics has fallen by the wayside.

Pathbreaking work on cognition in foreign policy emerged in the mid-1970s on the heels of the popular bureaucratic politics approach (e.g. Steinbrunner, 1974; Jervis, 1976.) One might have expected these new scholars to associate themselves with a larger "decision-making" paradigm that included theories of organizational behavior. Instead, advocates of the cognitive approach immediately distanced themselves from bureaucratic politics. For example, Steinbruner (1974) acknowledges the importance of "politics and policy," yet suggests Allison's Model III "is a conception of the decision process more supplementary rather than competitive to the analytic [rational actor] and cognitive paradigms" (142). In a pinch, one might turn to "politics" as a way to fill the gaps left by stronger theoretical explanations of decision-making.

Likewise, in his seminal work Perception and Misperception in International Politics, Robert Jervis dismisses the bureaucratic politics perspective because of its presumed logical (and thus, theoretical) inadequacy:

> As things stand now, there is no way to explore the extent to which bureaucratic factors cause the [foreign policy] outcome because we have no grounds for claiming that a different constellation of bureaucratic interests and forces would have produced a different result or that the outcome would have been different were there no bureaucracies at all (1976:28).[4]

In other cases, the relationship between cognition and bureaucratic politics has been one of indifference rather than competition. Larson's (1985) insightful treatise on attitude change by the Truman administration includes no reference whatsoever to Allison or bureaucratic politics. Indeed, in the cruelest cut of all, bureaucratic politics is deemed irrelevant to an explanation of foreign policy decision making.

Enhanced understanding of individual learning, memory, and information-processing in foreign policy is a significant and worthy research agenda, but it entails costs. Many interesting questions have to do with the interaction among individuals in the decision process. No bureaucrat is an island, yet the cognitive approach often treats organizational participants as if they operated in isolation from one another.

In what may be the apex of "cognitive isolationism" Yuen Foong Khong (1992) offers a penetrating analysis of analogical reasoning during the Vietnam escalation decisions of 1965. Building on the schema literature, Khong claims analogies are "cognitive devices" that help policy-makers diagnose problems in political decision-making (1992:12). The bureaucratic politics explanation is found wanting; what's more, Khong insists on drawing a strict line of demarcation between "whether the users of the analogies took them seriously, or whether the analogies were just tools for advocacy" (1992:197-200; 63). The author is not content to study a bureaucrat's use of analogy as a persuasive device; each advisor must *believe* his or her own analogy enough to trust it as an internal guide to decision-making (1992:102-105).[5]

Why not consider analogies as both a guide to decision-making *and* a tool for persuasion? If analogies are restricted to the former, one is forced to assume advisors are merely "thinking aloud" when citing historical precedents during their deliberations. Instead, analogies should be considered an essential feature of bureaucratic advocacy in foreign policy. Advisors who are familiar with the leader and with each other engage in a reasoning process about persuasion tactics and bargaining strategy.

Historical analogies are an important tool in managing the policy process. Analogies help group members accept the implications of their decision, and seal the current decision in its (perhaps grossly inflated) historical context. A reluctant president can rationalize taking the next logical step if this is

what Churchill would have done in a comparable situation. Likewise, shrewd bureaucratic combatants are aware that some analogies represent powerful symbols of failure; no self-respecting advisor wants to be held responsible for proposing "another Bay of Pigs." In the 1965 deliberations, Henry Cabot Lodge immediately tagged George Ball's tactical withdrawal proposal as "Munich" style capitulation (Berman, 1982:190). Whether Lodge knew it or not, "Munich" was the President's personal bete noire (Goldman, 1969) Successful linkage between the two episodes in Johnson's mind may have buried Ball's already feeble dissent.

Ultimately, the bureaucratic politics and cognitive perspectives are compatible. The research challenge for the next generation of foreign policy analysis is to harness the powerful insights of political cognition to the study of decision-making institutions and processes. I offer one response to that challenge in the next section.

Cognition in Context

In the effort to evaluate the "progress" of a research program or choose among contending paradigms, it is easy to lose sight of the central puzzles of greatest interest. The bureaucratic politics approach remains intriguing because it challenges us to understand what bureaucrats do, how and why they do it, and what causes them to modify their behavior. Stated differently,

> The hard core of the bureaucratic politics mix is personality. How each man [sic] manages to stand the heat in *his* kitchen, each player's basic operating style, and the complementarity or contradictions among personalities and styles in the inner circles are irreducible pieces of the policy blend. Then, too, each person comes to his position with baggage in tow. His bags include sensitivities to certain issues, commitments to various projects, and personal standing with and debts to groups in the society (Allison 1971:166).

A research agenda along these lines can appear daunting. Some criticize Model III for its "extraordinary complexity" and express disgust at this "analytical kitchen sink" filled with the dirty dishes of power, personality, and politics (Bendor and Hammond, 1992:318). Reviews of the literature on decision groups in foreign policy reveal modest progress (Gaenslen 1992) due perhaps to excessive reliance on a few classic but vague concepts such as "groupthink" (Hart 1991). Despite the scholarly multitudes who cite Allison, bureaucratic politics has inspired more reiteration than research.

What can be done? Given the powerful insights cognitive psychology has contributed to foreign policy analysis, it makes sense to build on this solid foundation in the revitalization of bureaucratic politics. The concepts of "self-regulation," "impression management," and "social intelligence" -- drawn from the field of social cognition -- are an excellent place to begin (Cantor and Kihlstrom 1985; Fiske 1993; Fiske and Taylor 1991; Showers and Cantor 1985). This body of literature examines the way people use knowledge, goals, and strategies for presenting themselves when interacting in social situations (Fiske and Taylor 1991:512).

The conception of the foreign policy-maker as a "naive scientist" (i.e. a person who attributes causality to events, and develops and tests informal "hypotheses" about his or her environment) has considerable resonance in the decision-making literature (George 1979; Larson 1985:34-42; Vertzberger 1990:48). Much of the existing work concerns the manner in which individuals reason about substantive problems, such as Harry Truman's attempts to draw inferences about Soviet behavior after World War II (Larson 1985). But individuals also reason about social interactions and processes, such as their organizational interests and affiliations in the foreign policy bureaucracy (Voss and Dorsey 1992:17-19).

The literature on social intelligence and self-regulation is quite consisent with Allison's claims about bureaucrats, including their desire to influence the president or other high ranking officials on matters of foreign policy. Successful bureaucrats understand the need to present themselves in a way that makes a positive impression on their peers, and of course, their leader. The important point is that while such behavior may be sycophantic, it is not mindless sycophancy. Susan T. Fiske posits that top-ranking officials "spend an inordinate amount of cognitive energy analyzing the president's personality in order to predict future behavior as it relates to their own concerns" (1993:250).

The "organizational culture" perspective offers a slightly different contribution to the study of bureaucratic politics (Feldman 1993:278-279; Frost et al. 1991; Martin 1992; Ott 1989; Peters 1990; Schein 1992). The overriding theme of this rather exotic literature is that deeply embedded, shared expectations allow organizations to function, and thereby help participants "make sense" of the decision-making process. In an extensive literature review, Ott (1989) defines the core elements of an organizational culture as its artifacts, values and beliefs, and basic underlying assumptions. Culture can be defined more simply, to borrow an oft-cited phrase in the literature, as "the way things are done around here."

How are "things done" in bureaucratic politics? According to Allison, bureaucrats become players in an ongoing game of influence and prestige. The rival tribes of the foreign policy bureaucracy

engage in mock battles over turf, agendas, problem definitions, and attention.[6] Many of the rituals (e.g. "getting the President's ear") make little sense from a rational choice or a cognitive problem-solving perspective.[7] The interpretive language of culture sounds imprudent: organizations ought to play an instrumental role, enabling decision-makers to maximize utility (or at least discover "satisficing" solutions) in an environment where time is limited and resources are scarce. Yet organizations are more than that:

> Many organizational events and processes are important more for what they express than for what they produce: they are secular myths, rituals, ceremonies, and sagas that help people find meaning and order in their experience (Bolman and Deal 1991: 244).

What could the organizational culture perspective contribute to the study of bureaucratic politics? Organizational culture is far less compelling than social cognition from the perspective of traditional social science. Where social cognition operates with a coherent set of theoretical concepts and relies on well-established means of empirical testing, organizational culture remains a set of free floating, intuitively plausible ideas. Nevertheless, organizational culture has a few things to offer students of bureaucratic politics and foreign policy decision making.

First, organizational culture is devoted to the study of organizations (primarily private or non-profit) that resemble political institutions in many respects. Much of the language (e.g. missions, shared assumptions, organizational learning) is familiar to foreign policy analysis. Furthermore, despite different terminology, the organizational culture perspective echoes many of the theoretical issues raised in the social cognition literature. The term "culture" has gained some usage among psychologists (Levine and Moreland 1991). Finally, the participant-observation methodology of organizational culture compels the researcher to acquire first-hand knowledge of an organization by way of sustained examination. Important precedent exists for this research method in other subfields of political science (e.g. Fenno 1978). Social cognition may provide a more respectable theoretical framework, but the maverick spirit of organizational culture has the advantage of encouraging researchers to explore decision-making in a natural bureaucratic setting rather than the laboratory.

Culture and cognition reinforce one another in the analysis of decision-making situations. Consider an example from the legal system. Judges and jurors render verdicts, a task with both cognitive and cultural dimensions. Legal arguments rely on precedent-based problem solving and can be explained by cognitive theories involving categorization, scripts, memory cues, and styles of information processing (e.g. Bennett and Feldman 1981; Carroll and Weiner 1982; Hastie and Pennington 1991). On the other hand a juror is not merely a cognitive problem solver reasoning in the

solitude of a laboratory. The American trial process is cloaked in ritual. Robes and formal attire, a swearing-in ceremony, highly-stylized forms of questioning, and secret jury deliberations help define participant roles and provide a set of meta-cognitive constraints on legal problem-solving. Decision-makers operate in both a cognitive *and* a cultural environment.

One of the enduring findings of Allison's Model III is that decision-makers cannot escape ingrained bureaucratic habits even under the most extraordinary conditions. The brink of a stark nuclear confrontation does not produce the sobering, rationalizing effect on participants predicted by neorealists (e.g. Mearsheimer, 1990; Waltz, 1981). Options remain shrouded in ambiguity. Policy debates are not free from ritual or gamesmanship. In the case of the Cuban missile crisis, the overwhelming cognitive need to solve a problem did not completely eliminate the participants' strongly felt cultural need to make sense of the experience.

A revitalized bureaucratic politics approach to foreign policy would answer an overarching question: How do members of interdependent, competitive, hierarchial decision groups reason about the policy process and what impact does such reasoning have on foreign policy outputs?[8] In the final section of this chapter, Bureaucratic politics might best be understood as the examination of three closely-related concepts: "bureaucratic roles" (how participants see themselves and others contributing to the decision process), "procedural scripts" (the structures, strategies, and premises that make pragmatic sense in a decision process) and "cultural rationales" (the attempt by participants to define appropriate behavior and invoke symbols to help give meaning to their decisions). The political manuevering of Lyndon Johnson's advisors in the aftermath of the 1968 Tet Offensive helps illustrate each concept.

Bureaucratic Politics and the Tet Offensive

The Tet Offensive in January 1968 resulted in a highly visible failure for the Johnson administration's Vietnam policy (Berman 1989; Schandler 1997; Wirtz 1991). Although Tet was not, strictly speaking, a military victory for the North Vietnamese it was hardly a loss for them either. Attempts by U.S. officials (including General William Westmoreland) to put the best face on the incident were contradicted by graphic television footage that gave the opposite impression. The Tet Offensive was the impetus for a major troop request General Westmoreland and General Earle Wheeler, chairman of the Joint Chiefs of Staff, in Washington. As Schandler observes:

> General Wheeler and the Joint Chiefs saw Tet as an opportunity to force the President's hand and to achieve their long-sought goal of a mobilization of reserve forces (1977:101).

The request included a politically volatile recommendation to call up U.S. military reserve units, and inadvertently sparked a major reassessment of U.S. objectives in Vietnam. In many respects, Johnson and his top advisors were confronting an ultimatum: either approve the request for 200,000 troops, thereby placing the U.S. on an all-out war footing, or deny the request, raising questions about U.S. commitments in Vietnam and elsewhere (Schandler, 1977:120).

Robert S. McNamara, a major figure in Vietnam planning during the Kennedy and Johnson administrations, was replaced as Secretary of Defense by Clark Clifford in early 1968. Clifford, a well established Washington "insider," was recruited on the basis of his personal friendship with Johnson as well as his presumed "hawkish" views on Vietnam. Ironically, Clifford became the catalyst for a reassessment of U.S. policy objectives.

The "Clifford Task Force," composed largely of civilians from the Department of Defense, met between 28 February and 4 March ostensibly to discuss the Westmoreland troop request. Most members of this group had long since grown dubious about the U.S. role in Vietnam and saw this as an opportunity to "educate" the new Secretary of Defense Clifford on America's folly. Task force members fed Clifford detailed, pessimistic assessments of American prospects in Vietnam. The Westmoreland-Wheeler troop request was roundly criticized and fundamental assumptions about U.S. strategy were questioned.

During February and March of 1968, Clifford engaged in a campaign of persuasion to alter Johnson's position on the war. The new Secretary of Defense helped build a coalition of bureaucratic support for a shift in Vietnam policy, acting as a mediator between harsh critics of the war and his old friend Lyndon Johnson.

Clifford's careful strategy of dissent was reinforced by private consultations between Johnson and individual advisers in and out of government. Apparently this is how Dean Rusk channelled his advice to Johnson in the aftermath of Tet. By 1968, Rusk was one of the only survivors from the Kennedy administration still serving Johnson, and had grown close to the President over the years. Although he was no dove, Rusk harbored his own set of doubts about the war. He was dismayed by the absence of any positive alternatives emerging from the work of the Clifford task force. Privately, the Secretary of State began lobbying Johnson to announce an unconditional (albeit geographically restricted) bombing halt north of the 20th perimeter. Johnson was skeptical about this option given his experience with past bombing halts.* Yet he paid attention to Rusk because Johnson wanted a "peace plan" and found it highly unusual that his loyal advisor was intent on advocating a specific policy option. Johnson took him seriously and urged him to develop the plan in greater depth (Schandler, 1977:190-191).

Finally Johnson heard from "the Wise Men," a group of distinguished former statesmen assembled by Clifford to discuss Vietnam with the President. Although unfamiliar with day-to-day operations in Vietnam, the "Wise Men" held strong views about American strategy. In addition, the group (which included Dean Acheson, George Ball, General Omar Bradley, McGeorge Bundy, and General Matthew Ridgway) had the stature to question U.S. policy since many had been (to use Acheson's phrase) "present at the creation" of containment strategy.

The confluence of advice from different sources confirmed what Johnson already suspected: the United States was failing to meet its objectives in Vietnam. Worse, the objectives themselves were in doubt. The situation was unlikely to be altered substantially by sending an additional two hundred thousand troops. Such action would, however, surely wreak havoc within U.S. domestic politics.

By the end of March, Johnson decided to withdraw from the presidential race given the domestic ramifications of U.S. policy in Vietnam. He announced his intentions in a dramatic speech on March 31, 1968. The important policy decision with respect to Vietnam was a partial bombing halt and a public invitation to Hanoi to begin negotiations.

Bureaucratic Role. Bureaucratic politics involves an interplay between individuals and their roles. A specific position, such as Secretary of State, carries with it a number of formal obligations and informal expectations. In short, "positions define what players both may and must do" to fulfill their responsibilities in a decision-making group (Allison, 1971: 164-165). Likewise, a powerful individual brings his or her own well-developed personal style to the position, perhaps redefining the job for future occupants. Finally, bureaucrats may be called upon to play different kinds of roles in different settings. The Secretary of Defense may act as a staunch policy advocate in a presidential advisory group but then assume the role of a neutral arbiter when chairing an interagency task force.

The traditional interpretation of the maxim "where you stand depends upon where you sit" illustrates some of the problems with an overly restrictive definition of bureaucratic role. In some respects Allison's work lends support to a mechanistic view of role where the "face of an issue" is derived exclusively from organizational interests. According to this logic bureaucrats restrict their policy proposals to those with the most obvious direct implications for agency involvement. The Marine Corps commandant should bark "send in the Marines" in response to every conceivable problem encountered by the decision group. Research in this vein has been inconclusive; at best one can argue that bureaucratic participants adopt positions consistent with their roles without necessarily being caused by the role (Smith, 1984/85).

Examination of actual foreign policy cases reveals a more complex, less rigid relationship between role and issue position.[10] While bureaucrats often propose solutions that conveniently involve a direct role for their agency, only the most politically-inept moron would expect the ploy to work every time. Experienced bureaucratic game-players know how to look out for their career and agency interests without being brutally obvious about it. They pick fights carefully, and exhibit reflexive behavior. Ever aware of context and peers, the skilled advocate can sense when a proposal is no longer relevant, when a question is "dumb", and when a line of argument will be considered invalid by the group.

The concept of "bureaucratic role" could be expanded to capture what Allison refers to as the bureaucrat's "style of play" and a "code of conformity" based, among other things, on career tenure and long term expectations (pp. 179-180). Social roles can be defined as shared expectations about how a particular person in a group ought to behave, and in some respects are the result of an ongoing negotiation between the individual and the group (Levine and Moreland 1990:601; Moreland and Levine 1982). Bureaucrats belong to one or more interdependent groups (i.e. groups where there is regular interaction and the members are reliant on others in some significant way). Roles allow individual members of a group to work together according to ascribed roles and negotiated boundaries.

In the case of Vietnam, for example, some of Lyndon Johnson's advisors felt constrained in both the substance and the style of the advice they could offer because of well-understood roles. Some individuals attempt to fulfill a bureaucratic role based on a strong personal convictions or model themselves on the style of a predecessor. Dean Rusk modified his advising style based on an idealized model of his formal position:

> At National Security Council meetings Rusk would sit impassively or would ask probing questions without revealing his own thoughts. His reserve came from his Marshallian view that a Secretary of State should reserve judgment until all had had their say. He also did not want to appear to argue with the President in front of other people, for fear it would be leaked to the press (Schoenbaum 1988:276).

Bureaucratic roles help us understand a decision-maker's own interpretation of appropriate norms (i.e. "sit impassively", "ask probing questions", "reserve judgment"), and unwritten, but widely-observed rules of the game (i.e. "don't argue with the President in front of other advisors") that constrain or enable behavior in a social context. For Rusk, sitting in the Secretary of State's chair determined where he stood with respect to the rules of the decision process. Rusk's behavior is similar to problem solvers in other domains where "cognition" is influenced by "metacognitive"

assumptions about role, task, and environment (Schoenfeld 1983).[11]

In other cases, ambiguity over role created barriers to effective advocacy and information processing. Clark Clifford reports that he and Bill Moyers both shared George Ball's objections to U.S. escalation in the summer of 1965. Participant roles (whether self-defined or group-defined) place limits on avenues of advocacy. When Clifford attended a foreign policy advisory meeting in his role as "a personal friend" to Johnson, he chose silence over active participation in the deliberations (Clifford, 1991:414). Moyers had growing doubts about the war, but "felt he could not play a role in policymaking because his job as Press Secretary constrained him from active policy formulation" (p. 416). In a corollary to Allison, "where you sit" determines the rules of engagement on the bureaucratic battlefield.

As Clifford's informal involvement on Vietnam became more routine, his status changed from "the President's friend" to an informed outsider, free to speak his mind on controversial issues:

> An outside adviser can serve the role of a Doubting Thomas when the bureaucracies line up behind a single position, or help the President reach a judgment when there is a dispute within the government. They can give the President a different perspective on his own situation; they can be frank with him when White House aides are not" (Clifford, 1991:424).

In short, outsiders can often play by a different set of rules than those who must conform to an official insider role (Allison 1971:180). A number of conceptually plausible bureaucratic roles have been proposed, including "advocates, brokers, and cue takers" (Stewart, M. Hermann, & C. Hermann 1989), "custodian-manager" or "honest broker" (George 1981; Moens 1990), and even "oldtimers, newcomers, and scapegoats" (Levine and Moreland 1990). Systematic, theoretically-informed research on bureaucratic roles could enlighten foreign policy analysts on how such roles are established, maintained, or discarded in the policy process.

Procedural Scripts. The concepts of "schema" and "script" have been applied in several important studies of foreign policy decision-making (Herrmann 1988; Khong 1992; Larson 1985). For example, the "Munich analogy" might be considered an episodic script about past appeasement of an aggressor (Larson 1985:54). Scripts help decision makers deal with ambiguity; a familiar sequence of events is invoked and applied to interpret the situation at hand. Scripts can be defined as "knowledge structures that represent appropriate sequences of events in well-known situations" (Vertzberger 1990: 158). The proverbial example of a script is a customer's expectations about the familiar events encountered in a restaurant (Abelson 1981:715). As Fiske and Taylor point out, "scripts contain props (such as the menu), roles (such

as the waiter), and sequence rules (such as reading the menu before ordering" (1991:119).

Successful bureaucrats rely on an arsenal of institutional strategies and tactics for problem-solving.[12] Just as bureaucratic roles are important for determining appropriate relationships, a bureaucrat's understanding of the "rules of the game" within a particular decision group can facilitate efforts at bargaining, persuasion, and coalition-building (Allison 1971: 170-171).[13] In a world of ambiguous policy problems, knowledge about the policy process helps decisionmakers "decide how to decide" and "learn how to learn."[14] Decision-makers try to structure institutions in ways that suit their needs for problem solving, information search and retrieval, and experimentation. For example, creation of the ExComm for managing the Cuban missile crisis might be considered an institutional experiment intended to maximize the fit between the cognitive style of participants with the problem-solving task they confronted.[15]

Widely-shared, well-understood procedural scripts help a decision-maker anticipate the moves of a fellow bureaucrat. Sometimes anticipation contributes to policy failure when one bureaucrat's expectations about the actions of a colleague are incorrect (Ripley and Gardner 1992). In other cases, a pragmatic understanding of decision rules may help a bureaucrat modify his or her behavior to capitalize on the patterned behavior of another group member.

As presiding member of the troop request task force, Clifford was well aware of the serious disputes arising within the bureaucracy over policy in Vietnam. He was also familiar with the tendency of bureaucrats to act as vociferous advocates on behalf of their policy preferences, at times basing arguments on overly-optimistic forecasts or "worst case scenarios." With this in mind, Clifford adopted a probing, skeptical Socratic style when questioning military experts about their underlying assumptions rather than allowing them to confuse the issue with platitudes or questionable statistics. Although working from the same body of evidence as before, Clifford's leadership style encouraged group members to voice open criticisms during task force meetings. The floodgates were opened, and previously stifled dissent was given an impartial hearing.

Cultural Rationales

Rituals are pervasive in bureaucratic decision-making because they endow deliberations with special meaning, and establish boundaries of appropriateness, decorum, and fair play. The first two concepts, "bureaucratic role" and "procedural script," reinforce a decision-maker's identity and provides pragmatic clues for anticipating the moves and counter-moves of bureaucratic competition. The third concept, "cultural rationale," speaks to the

decision-maker's desire to justify long-standing traditions or idiosyncratic features that define every decision-making group.

Students of American foreign policy often point to well-established "cultures" perpetuated by Foreign Service Officers in the Department of State, or the proud traditions of various branches of the armed forces (Kegley and Wittkopf 1991:365-371; Rosati 1993: 147-169). Comparable "cultures" or traditions develop within a decision-making group as it evolves over time, or as it conforms to the style of a powerful, charismatic leader.

Lyndon Johnson's political experience taught him the importance of consultation. In some cases, consultation was motivated by very pragmatic goals. Johnson cultivated a network of political contacts, often by telephone, to provide the latest bits of information or offer reactions on the political feasibility of a decision (Best 1988). During the 1964 presidential campaign Johnson relied on three groups of advisors: one for day-to-day operations, another for strategy and tactics, and "a third group second-guessing the first two groups" (Clifford 1991:398).

Consultation also served important symbolic purposes for Johnson. For example, getting a large number of advisors "on board" a proposal could provide valuable insurance in the event of a policy failure. Consultation also allowed Johnson to convey respect for the opinions of a politically important ally or demonstrate the extent of his patience and tolerance. The lengthy meetings on Vietnam in July 1965 are believed to have been staged for the benefit of George Ball (and, more importantly, future historians) in order to prove that all opinions had been given a fair hearing (Berman 1982). Why bother to consult even after a decision has been reached? Consultation represents the way things "ought to be done" given the far-reaching implications of a presidential decision.

Clifford's familiarity with at least one "cultural rationale" in the Johnson White House resulted in a master stroke of bureaucratic advocacy. The hastily arranged meeting of the "Wise Men" -- pillars of the Cold War establishment -- conformed well to the tradition of White House consultation. In an earlier meeting, these staunch defenders of U.S. containment policy reassured Johnson about Vietnam, and urged him to keep the faith. By the time of there March 1968 meeting, however, the senior statesmen of American foreign policy had undergone a serious transformation of thier thinking about Vietnam. Rather than bolstering Johnson's policy, many members of the group urged the President to find an honorable (but hasty) way to withdraw the U.S. commitment to Vietnam. Once the members had delivered their pronouncement, it became exceedingly difficult for Johnson to reject the results of consultation.

Conclusion

In 1965, George Ball tried and failed to force a reappraisal of fundamental objectives on Vietnam. Although in hindsight much can be said for Ball's "tactical withdrawal" arguments, Johnson and top advisors remained unconvinced. In the aftermath of Tet, Clark Clifford succeeded where George Ball failed, not because Clifford had better ideas or because he had spent more time studying the issues. Clifford didn't bring any new ideas or additional information about Vietnam into the White House in 1968. He did bring a lifetime of experience in the practice of Presidential advising, and tremendous insight into the mind and moods of Lyndon Johnson. Clifford orchestrated, schemed, and plotted a campaign of dissent from virtually the day he entered the White House, but remained loyal to Johnson and let the President discover -- or more likely acknowledge -- for himself that U.S. policy toward Vietnam had to change.

Nothing about Allison's work is sacrosanct. We need not puzzle over each word, or attempt to preserve each sentence of Essence of Decision like scribes passing down an ancient, sacred text to the next generation of foreign policy analysts. Allison's models ought to be challenged, reinterpreted, and modified to take account of recent literature and new theoretical concerns. A new focus on the they way bureaucrats reason about the policy process provides an appropriate avenue for revitalizing the study of bureaucratic politics.

1. A revised version of this paper is scheduled to appear in the forthcoming volume Foreign Policy Analysis: Change and Continuity in its Second Generation, Laura Neack, Jeanne A.K. Hey, and Patrick Haney (eds.). The author gratefully acknowledges research support from the Mershon Center Research Training Group on the Role of Cognition in Collective Political Decision-Making, National Science Foundation (DIR-9113599), Ohio State University.

2. Welch provides a systematic examination of this question in Table 1 (pp. 143-146) of his excellent article.

3. Anything beyond the saturation point may cause foreign policy makers to experience "information overload", and employ tactics such as procrastination and filtering to cope with this situation (Vertzberger, 1990:86-101).

4. Of course, the same criticism applies to cognitive studies of foreign policy.

5. Although, in fairness, Khong concedes that the role of analogies in forging concensus and facilitating decisions would make them "worthy of study in their own right," but this is deemed a much lower research priority (1992:103).

6. Allison literally refers to the bureaucratic participants as "Chiefs" and "Indians."

7. For example, important CIA telegrams were kept from Kennedy for fear of a "cold reception" (Allison, 1969:713); eventually informed of the missiles, "in order to mask our discovery from the Russians, the President flew to Connecticut to keep a campaign commitment, leaving RFK as the unofficial chairman of the group" (Ibid. p.715).

8. Foreign policy outputs refer to the results of the decision process, while foreign policy outcomes imply a much broader scope. A foreign policy output such as a U.S. decision to retaliate against Iraq cannot, by itself, provide a complete explanation of the ultimate outcome of such action.

9. Clark Clifford claims the President felt he had been "suckered in" to the unproductive Christmas bombing halt of 1965 by his advisors. Clark Clifford, Oral History, 2:20, Lyndon B. Johnson Library, Austin, Texas.

10. Indeed, Allison lists a number of factors that compete with career/organization interests (such as misperception, miscommunication, and reticence) in defining the "face of an issue" (Allison, 1971:178-179).

11. Schoenfeld's (1983) experimental research on mathematical problem solving by experts and novices suggests the power of context even in the pristine world of geometry. Reliance on a formal proof would have simplified the task, but the inexperienced problem-solvers rejected formal proof in favor of more intuitive methods (e.g. free hand drawing and "eyeballing" to estimate points on a circle). Proofs are just something you do to demonstrate work to a teacher. Likewise, the pressure to please a favorite math professor led subjects to restructure a difficult, unfamiliar problem in more familiar terms in order to have something to show for their efforts.

12. The concept of "standard operating procedures (SOPs)" might be a perfectly acceptable (even preferable) alternative to "script" were it not for the fact that the vast literature "cybernetics" has transformed SOPs into rigid, cyborg-like responses (Marra 1985; Steinbrunner 1974). I have something much more flexible and responsive in mind.

13. Refer to Bettenhausen and Murningham (1985) and Martin (1982) for a slightly different interpretation of the "script" concept as applied to organizations.

14. Indeed, the deceptively simple question "can governments learn?" (Etheredge, 1985) requires a complex answer. A recent review article by Huber (1991) suggests the richness of "organizational learning", with a range of focused questions on "searching", "organizational experiments", "cognitive maps and framing", "unintentional learning", and even "unlearning."

15. In fact, during the 1963 Diem crisis, Kennedy's advisors made a conscious effort to replicate the successful institutional design of the ExCom ("Memorandum of Conference with the President", August 27, 1963, John F. Kennedy Library).

EXPANDING THE DISCURSIVE CONTEXT OF POLICY DESIGN: A MATTER OF FEMINIST STANDPOINT EPISTEMOLOGY

STEFANIE S. RIXECKER
DEPARTMENT OF POLICTICAL SCIENCE
PURDUE UNIVERSITY

Paper prepared for the American Political Science Association Annual Meeting, Washington, D.C., September 2-5, 1993.

Expanding the Discursive Context of Policy Design:
A Matter of Feminist Standpoint Epistemology

Abstract

While recent elaborations of policy design have been innovative and intriguing, feminist analysis has remained unacknowledged. The exclusion of feminist analysis confounds policy design's goal of increased sensitivity to context, values, and audience. The author uses feminist standpoint epistemology to illustrate and expand the dialogue of policy design as well as policy analysis generally. Addressing policy analysis from a meta-perspective facilitates a discussion of theory, methodology, and practice. The applicative aspects of the feminist epistemic stance are illustrated via a hypothetical case study addressing the environmental problematique. As such, a feminist standpoint reformulation of policy design is proffered. Overall, the analysis expands the theoretical construction of policy design, providing an increased potential for participatory policy analysis and a bridge between two discourses previously lacking interchange.

INTRODUCTION

Policy design is a relatively new and innovative approach to policy analysis, evolving out of previous research in the policy sciences, organization theory, and policy formulation. Generally speaking, policy design represents the process of creating, developing, and attuning an actionable framework with the intent of ameliorating some policy problem. Since each policy problem has unique aspects, sensitivity to context and values becomes particularly important in determining the appropriate strategy and concomitant tool selection [Linder and Peters, 1989; Hood, 1986]. Epistemology is the foundation for such contextual and value-oriented strategizing. Although previous studies [Bobrow and Dryzek, 1987] addressed a variety of pertinent epistemic or "knowledge orientation" approaches, the role of feminist epistemology remains unacknowledged. I seek to answer how and to what extent an alternative epistemic stance, such as feminist standpoint epistemology, can expand the discursive context of policy design.

This paper delineates and elaborates upon feminist standpoint epistemology,

particularly as outlined by Sandra Harding [1991, 1986], as an alternative means of value and context definition, thereby reformulating the actionable framework of policy design. It should be noted that feminist standpoint epistemology is not deemed superior to other epistemic stances; rather, it is a parallel "knowledge orientation" whose exclusion limits policy design efforts. Feminist standpoint epistemology is used to further the strategic flexibility of policy analysis, thereby addressing theoretical and practical aspects of policy design. As such, the ***theoretical*** framework is enhanced by a new and inclusively-oriented epistemic construction. Additionally, the ***practical*** element of policy design is bolstered by expanding the discursive and practical space for policy analysts (male and female) wishing to use alternative techniques in the policy making process. Thus, besides defining feminist epistemology and its relevance for policy design, I specify the tools which may be of use in designing policy from a feminist perspective. These tools, or methods, include quantitative as well as qualitative approaches to policy analysis. Diversifying the "toolbox" of policy design does not simply apply to theoretical concerns, but also facilitates problem definition and resolution, thereby adding an applicative element to the research. Overall, the intent is to expand the constructs of policy design in order to create a more inclusive and participatory approach to both policy analysis and public policy.

Prior to presenting a new formulation of policy design, it is necessary to review the main ideas and theoretical constructions offered by policy design and feminist literature respectively. The analysis begins with an overview and articulation of Bobrow and Dryzek's [1987] key arguments and concomitant "critical policy analysis" framework. In doing so, the primary elements of their theory, including their assumptions and biases, will be pinpointed.

Additionally, the rationale for using Bobrow and Dryzek's framework as the core of this analysis will be explained. Overall, the specific target of discussion will be the construction and definition of "context." The second section articulates Harding's [1991] elaboration of the feminist standpoint perspective and its relevance to theory building in the social sciences. The third section anticipates a reformulation of policy design by formally critiquing the barriers inherent in Bobrow and Dryzek's [1987] approach from a feminist epistemic standpoint. The fourth section explains how the arguments and propositions of these authors enable a more inclusive, communicative, and participatory approach to policy analysis and public policy overall. Having outlined and articulated these positions, I conclude with a hypothetical case study in which the reformulated feminist conception of policy design is applied to an environmental policy concern. This is a continuation of the hypothetical "Smoke Valley" scenario conceived by Bobrow and Dryzek [1987], and illustrates the potential alternatives a feminist reformulation of policy design affords.

POLICY DESIGN: THEORETICAL CONSTRUCTIONS

Although Bobrow and Dryzek [1987] are not the sole contributors to "policy design," their construction of this novel approach represents the core of this paper. Most scholars [deLeon, 1988-89; Ingraham, 1987; Linder and Peters, 1989, 1987] focus more upon procedural and direct "policy process" aspects of design. While this is a necessary element in further delineation of policy design, it does not address the import or consequences of the theoretical assumptions involved, i.e., a meta-policy perspective. A few broader theoretical discussions have been elaborated [Dryzek, 1983; Linder and Peters, 1984, 1988; Weimer,

1993], but [Bobrow and Dryzek 1987] provide the most thorough and articulate discussion of policy design's theoretical foundation. As such, their analysis provides the most direction for theory **and** practice, two elements which are integrally linked. Overall, Bobrow and Dryzek's [1987] formulation of policy design represents the most useful framework on which to build.

The authors begin by describing the key analytic tools used by policy analysts. These tools include welfare economics, public choice, social structure, information processing, and political philosophy. The authors label these tools as "frames of reference." Simply stated, they are disciplines or schools of thought used within policy analysis. These "frames of reference" provide the policy analyst with particular means of addressing policy problems. Included in such tools, no matter which ones, are certain value-preferences which affect the overall policy decision making process. As such, the policy analyst's tool selection reflects the analyst's value orientation and context assessment. In turn, defining remedies results in a reflection of the premises underlying each approach. For Bobrow and Dryzek, the best way to illustrate the "frame of reference" assumptions and consequences is via a hypothetical example. Thus, in order to fully illustrate the dimensions of each tool, the authors employ an environmental policy example in which a hypothetical community, Smoke Valley, must contend with air pollution. Using such a hypothetical policy case illustrates the inherent assumptions of each analytic framework and emphasizes the consequences of these approaches. Although the details of each approach are not reiterated herein, the final section of this paper continues the hypothetical case study by applying a feminist policy design approach to the Smoke Valley situation. In this way, Bobrow and Dryzek's [1987] main

points can be contextualized, providing a coherent frame of analysis and discussion of the feminist standpoint, especially with regard to theory, methodology, and (potential) outcomes.

Bobrow and Dryzek [1987] are not simply content to reiterate the analytic frameworks derived and used within policy analysis. Instead, they describe and analyze the importance of the "metalanguage of social science: the philosophy of inquiry" [Bobrow and Dryzek, 1987:15]. The authors believe metalanguage to be so integral to their policy design arguments that they devote all of "Part Three" of their text to its articulation. What exactly is the "metalanguage?" Simply put, it is epistemology. Although some may point to the paralytic outcome of such an approach, the authors comment that epistemology is critical for a better understanding of the consequences of present policy approaches and general decision making techniques. Indeed, they state in the introduction that "attention to epistemology may help overcome the stalemate resulting from the plethora of analytical frameworks..." [Ibid:16]. Additionally, since their interest is to create a more flexible and strategic policy analysis approach, the inclusion of theories of knowledge, and their concurrent social uses, is imperative. Overall, they review the "major contemporary schools of philosophy of science," defined as positivism, piecemeal social engineering, rationality, relativism, and critical enlightenment, in order to place the variety of analytic tools into a more interpretable context. It is important to reiterate that metatheorizing, whether described as metapolicy or metalanguage of social science, is a critical element in explicating policy analysis and its derivative analytic frameworks because it is the first step in providing a more inclusive and communicative theory of policy analysis.

The epistemologies grounding the various analytic approaches suggest that a variety of

social and "knowing" contexts exist. Such a multi-contextual theoretical reality creates a more complex practical reality for the policy analyst. It is this contextual multiplicity that Bobrow and Dryzek [1987] promote in order to illustrate the importance of flexibility and communicative discourse within policy analysis. The first is the milieu itself. This includes the elements outside the policy process; it is where the policy will take effect [Ibid:202]. The second type of context is defined as "the policy process within which designers and others are pursuing the adoption and implementation of policies" [Ibid:202]. Thus, the elements of context are divided into two operational spheres. The internal and external elements have a clear, categorical placement within Bobrow and Dryzek's [1987] definition of context. As we shall see in subsequent sections, this dichotomization also suggests other implications, such as the perpetuation of power structures within and between these constructed arenas.

Besides their categorization of contextual arenas, the authors suggest five important contextual dimensions for policy analysis: complexity and uncertainty, feedback potential, control, stability, and audience [203-206]. These dimensions are important since they address how values, actors, and feedback are critical components of a detailed contextual map. Although these dimensions may seem obvious to many, it is important to point out that they are indeed a radical reorientation for policy analysis. This reorientation is profound for two reasons: (1) it locates previously defined components of policy analysis and links them together and (2) it necessitates that policy analysts expand their conceptual schemas, thereby demanding greater attention to contextual and human factors.

After their epistemological exposition, Bobrow and Dryzek [1987] reveal which

contemporary epistemology they feel the greatest affinity towards; they refer to it as critical enlightenment. This knowledge orientation includes a variety of philosophical and social science contributors, but the authors focus upon the two they believe to be most important for policy analysis, Jürgen Habermas [1984, 1973a, 1973b] and Harold Lasswell [1951; Lasswell, et al., 1952]. The main reason this epistemic stance provides a radical alternative to traditional policy analysis is because it begins with the assumption, or outright objective, of "emancipation." As Bobrow and Dryzek [1987] explain, this emancipatory focus epitomizes the need for "the improvement of human existence through increased awareness on the part of individuals as political actors"[170]. Bobrow and Dryzek [1987] discuss these theorists, but also move beyond Habermas's and Lasswell's arguments in order to explain their own interpretation of critical theory, specifically "critical policy analysis."

Bobrow and Dryzek [1987] expand upon their epistemic preference, critical enlightenment, by establishing some primary elements of the knowledge orientation's significance for policy analysis. Perhaps one of the most intriguing is that critical policy analysis incorporates ***practical intent*** as a main feature. As the authors explain,

> Critical theory commends, then, a continuous interchange of ideas, interpretations, and criticisms between social scientists and other political actors [Ibid:171].

Similar to the authors' creation of two realms of context, noted earlier, this "continuous interchange" also becomes bounded. Specifically, Bobrow and Dryzek [1987] desire their formulation of "critical policy analysis" to be distinct from other critical theories, including feminism [169].

This is not the only aspect in which their theoretical explanations seem contradictory. In addition to bounded interchange, the authors argue that "the critical policy analyst could make use of facets of particular frames of reference but could not be partisan to any of them" [181]. Bobrow and Dryzek do not explain how such "non-partisan" positioning can be integrated with their distinction between types of critical theories, as noted in the previous paragraph. Additionally, is this call for "non-partisanship" a reasonable demand? It would seem reasonable to suggest that open-mindedness be maintained throughout the policy analysis process, but it is most difficult to *absolutely* and *completely* remove *all* elements of partisan affiliation. This is especially contradictory since the authors later suggest,

> Fledgling policy analysts who wish to advance in a clearly structured intellectual community would do well to adhere to approaches with a highly technical flavor...[119].

The authors do not simply make this one suggestion for "successful" career patterns; they describe a number of paths. Thus, we must ask two questions: (1) how can interchange between and within social scientists and political actors be actualized when the theory separates itself from pertinent inclusive attempts, such as feminism?, and (2) how can the theory demand non-partisan tool selection when it also looks toward practical career concerns? How could Bobrow and Dryzek [1987] construct a critical policy analysis framework *without* a sense of the feminist standpoint concerns of power structures, tool selection, and theory construction? This is the crux of the dilemma in their conceptualization of policy design; hence, the need for a reformulation. However, the foundation of feminist standpoint theory must first be articulated.

THE CASE FOR A FEMINIST STANDPOINT EPISTEMOLOGY

Sandra Harding [1991] provides an expanded conception of feminist standpoint epistemology. Although she articulates the nuances of the framework more than any other theorist, her ideas are grounded in other similar discussions [Collins, 1991; Flax, 1986; Hartsock, 1983]. Generally speaking, feminist epistemology challenges a variety of traditional conceptions of knowledge creation [Alcoff and Potter, 1993]. Rather than follow the Western canon of epistemological formulations, such as positivism and rationality which focus upon a separation of knowledge and experience, feminist standpoint epistemology attempts to unite these two components. Feminist arguments suggest that knowledge and experience cannot and should not be divorced from one another. A separation between these two elements creates an artificial dichotomization of knowledge creation. The critical element of understanding ourselves and the world is to realize that our knowledge is a direct reflection of our experiences within it [120]. As such, it is important to note that

> a standpoint is not a perspective; it takes science and politics to achieve a standpoint. Standpoints are socially mediated; perspectives are unmediated [276].

Although the unification of subject/object is appealing, it is important to acknowledge that feminist standpoint epistemology does not remedy the tension between person-specific (contingent) linguistic constructions and the 'real' world. As Haraway [1991] aptly points out, feminist standpoint epistemology's willingness to accept and incorporate this tension is what makes the epistemic stance so viable. She remarks

> ...'our' problem is how to have *simultaneously* an account of radical historical contingency for all knowledge claims and knowing subjects,...*and* a no-nonsense commitment to faithful accounts of a 'real' world, one that can be partially shared and friendly to earth-wide projects of finite freedom, adequate material abundance, modest meaning in suffering, and limited happiness

[emphasis in the original] [187].

The result is an integration of theory and praxis, for

> We need the power of modern critical theories of how meanings and bodies get made, not in order to deny meaning and bodies, but in order to live in meanings and bodies that have a chance for a future [Haraway, 1991: 187].

As such, knowledge generation reflects a situated view of reality.

The traditional epistemological separation of experience and knowledge leads to some other difficulties which are relevant for this analysis. Perhaps the most disturbing consequence of this separation is the perpetuation of the illusion that traditional epistemic approaches can provide a fully objective and accurate representation of the issue at hand. Whether in a natural or social scientific setting, value-free methods and research designs are not a possibility. The idea of value free research results from the traditionalist epistemic structures previously mentioned. Indeed, the notion of epistemology, as conceived by the positivists and rationalists, does not reflect the process of human inquiry. Instead, it creates a skewed sense of knowledge creation by suggesting it can be ahistoric, universal, and fully objective. The major consequences of this constructional form is that it suggests there is no (and ought not be) a connection between the researcher and the subject (or "object" as the traditionalists would argue). Objectification of the subject has two particularly damaging consequences: (1) it transforms the subject into an "Other" or outsider [Collins, 1991], and (2) in so doing, directly creates a socially situated power construction. Thus, feminist epistemology is not only an attempt to address the ahistoric, culture-blind knowledge construct, but is also an attempt to dismantle the theoretical and practical discursive power structures which such traditional epistemic stances constructed.

Yet, how can these barriers be dismantled? Must we fully disassemble the notions of objectivity? Is the only alternative to universal knowledge claims relativism? If so, then is feminist epistemology a "theory of knowledge?" These are all critical questions which Harding articulates, and attempts to resolve. In order to provide a foundation for the forthcoming sections regarding the reconstitution of policy design, these questions will be addressed in detail.

Harding [1991] does not believe that theorizing, whether in the natural or social sciences, fully needs to remove itself from the claim of objectivity. The definition and formulation of this concept does need to be reconstructed, however. Specifically, Harding calls for "strong objectivity" [Harding, 1991:142]. As she herself states

> A feminist standpoint epistemology requires strengthened standards of objectivity. The standpoint epistemologies call for recognition of a historical or sociological or cultural relativism - but not for a judgmental or epistemological relativism [ibid].

Yet, how can such an entrenched concept as "pure" objectivity be reformulated? After all, would not such a restructuring simply perpetuate the negative consequences of a masculinely engendered construction? Harding cleverly transforms objectivity into a positive feminist concept by arguing that objectivity, as constructed by positivists, is simultaneously too broad and too narrow. Its breadth is defined by its universality; objectivity as a value-free construct necessitates the absolute elimination of all values within research [Ibid:144]. The narrow aspect of its scope regards the way in which objectivity is framed; it is a construct of value agreement between and among specific researchers, i.e., within the scientific community [Ibid:143]. Additionally, this narrow conception of objectivity illustrates the way

> Modern science has again and again been reconstructed by a set of interests

and values - distinctively Western, bourgeois, and patriarchal...[Ibid:145].

Thus, the dualistic nature of objectivity allows Harding to call for a stronger sense of objectivity inclusive of historically and socially situated contexts.

Formulating such a "strong objectivity" does not answer all of the questions previously cited. The concern of crass relativism, or "epistemological relativism" as Harding calls it, is a serious issue. If the argument becomes that each individual's experiences are as relevant as another's, then it is impossible to employ any conceptualization of knowledge beyond one's self. What is the difference between epistemological relativism and cultural/historical/sociological relativism? Is this simply an academic endeavor, or is there some practical value to such cogitation? Indeed, there is quite a bit of value in such distinctions. Rather than fall into the false dichotomy of an "all-or-nothing" formula, Harding explains how alternative levels of difference facilitate flexibility while stabilizing theoretical discourse. It is "strong objectivity" which comprises the solution to this seeming dilemma. Feminist standpoint theory demands

> the acknowledgement that all human beliefs -- including our best scientific beliefs -- are socially situated, *but they also require a critical evaluation to determine which social situations tend to generate the most objective knowledge claims*. They require, as judgmental [epistemological] relativism does not, a scientific account of the relationships between historically located belief and maximally objective belief [Ibid:142]. [Emphasis added]

Similarly, but in a postmodern voice, Haraway [1991] posits that

> The alternative to relativism is partial, locatable, critical knowledges sustaining the possibility of webs of connections called a solidarity in politics and shared conversations in epistemology....[I]t is precisely in the politics and epistemology of partial perspectives that the possibility of sustained, rational, objective enquiry rests [191].

Although these are complex theoretical explanations, overall they create a realm in which the

two seemingly contradictory elements, (1) feminist criticisms of maximal objectivity and (2) the applicative contextual demand for critical evaluation, may coexist.

Finally, we turn to the question of "theories of knowledge." If the natural and social sciences are socially situated, as Harding [1991] describes, then how is it possible for us to call them epistemologies? Would it not be more accurate to simply define them as sociologies of knowledge? Yes, in one sense, standpoint theories represent sociologies of knowledge. It is important to keep in mind that all conglomerations of socially situated experience, used as worldview explanations, converge to form sociologies of knowledge. This taps into the arguments already presented. Since *all* epistemological stances incorporate political and value-laden components, they may be regarded as sociologies of knowledge. Feminist standpoint epistemology is distinctive because it clearly espouses and accepts its sociological orientation. This openness should minimize skeptics' demands for greater "philosophical rigor" or "empirical proof" since it accepts the tension between relativism and 'reality,' unlike epistemic stances of the Western canon, i.e., ala Plato, Aristotle, and Kant. Thus, label choice (sociology of knowledge vs epistemology) depends upon the socially situated position of the individual.

The detailed theoretical explanations above have two particularly relevant ramifications. First, feminist standpoint epistemology establishes a radical conceptualization of theory-building, particularly for the social sciences. Rather than regard the natural sciences as the rudiment of knowledge, Harding suggests that "it makes good sense to think of the natural sciences as a subfield of the critical social sciences" [Ibid:15]. This, in turn, leads to the second ramification, the critical aspect of context. Theory-building is thus

inextricably linked with sociological, political, historical, and psychological contexts. Specifically, race, sex, gender construction, class, and sexuality all play a role in the creation of epistemological stances. Additionally, this panoply of contextual elements shapes one's preferred tool selection. In this sense, we are partisans of our epistemological ***and*** methodological preferences. To claim a non-partisan attachment would simply reify the false dichotomy constructed via positivist epistemology. Overall, feminist standpoint theory creates a more inclusive theoretical discourse thereby concurrently opening a door for more inclusive and contextual practical applications.

POLICY DESIGN: A FEMINIST STANDPOINT RECONSTRUCTION

Thus far, each theoretical discourse, policy design and feminist standpoint epistemology, has been presented as separate entities. This reflects the silence between the two discourses. The two offer potential alterations in policy analysis, yet neither speaks directly to the combined import of a feminist policy design. A feminist reconstitution of policy design necessitates revisiting some of the discussions already presented. These include the issues of context, power, and partisanship. Additionally, the intersection between the two discourses will be explored not only on a theoretical level but also on a practical plane. Overall, this section of the paper combines epistemology, theory, and method.

Both policy design and feminist standpoint epistemology contend with context. Bobrow and Dryzek set out to create a more contextual policy analysis process. Their idea of "contextual" appears to fit easily with the contextualization elements presented by feminist standpoint epistemology. However, the complementarity is not as simple as it first seems.

Although Bobrow and Dryzek [1987] assert that flexibility and increased communicative action will be enhanced by policy design's contextual dimensions, they simultaneously include two claims which at best lead to confusion and at worst create a serious theoretical flaw in their framework. First, they purport to support greater interchange between social scientists and policy actors, yet they simultaneously call for a separation between their own critical theoretical formulation and others, such as feminism [Bobrow and Dryzek, 1987:168]. Second, they claim that a phenomenological epistemological stance is useless in the social sciences, especially in the case of policy analysis [171]. The concern with this position is that the authors do not fully explain their understanding of phenomenological other than reiterating its "interpretive" and "descriptive" nature. Thus, one is left wondering whether they would purposely exclude the feminist standpoint epistemic view simply because they regard it as phenomenological.

Establishing the need for a more contextual and sensitive policy analysis framework requires more than assertions. Bobrow and Dryzek provide some good suggestions, but they do not realize to what extent their "critical policy analysis" remains mired in the positivist epistemological stance. Feminist standpoint epistemology reveals this entrenchment and provides a means to move beyond such exclusionary theorizing. The critical element feminist standpoint epistemology provides is the distinction between historical/political/sociological/psychological relativism and epistemological relativism. Bobrow and Dryzek's [1987] qualm with phenomenology taps into the positivist's denial of socially constructed reality; they turn a sociological relativism into an epistemological one. Alternatively, feminist standpoint epistemology expands the contextual nature of policy

design by respecting the diversity of actors in the policy process. This acceptance creates a more inclusive space for policy analysis, a goal also held by Bobrow and Dryzek. Thus, by clarifying the intricacies, e.g., value predispositions, of epistemological theorizing, the feminist standpoint expands the contextual boundaries of policy design.

The contextual aspect of policy design must also contend with other tensions such as power and partisanship. Bobrow and Dryzek's construction of policy design falls short of minimizing the degree of power relations within policy analysis. For example, their dismissal of phenomenological epistemic approaches parallels the traditional Western canon's disregard for such philosophical positions. The result, no matter who takes the position, is continued marginalization of women; theoretical power couched in patriarchal constructions affect application. This is particularly clear in their discussion of partisanship. As stated, creating a contextualized framework requires a dual perspective incorporating theory and application. Although Bobrow and Dryzek [1987] attempt to combine these two elements, their theoretical articulation is confounded by muddled affiliational and political components. An affiliational component relates to the issue of partisanship. Specifically, Bobrow and Dryzek [1987] argue that the policy analyst must remain a non-partisan in tool selection. At the same time, the political component outlined by Bobrow and Dryzek argues that it is politically sensible to select one's tools according to the audience at hand. This does not reflect a non-partisan approach. In this way, Bobrow and Dryzek confound their analysis with poor practical illustrations. A solid policy design framework need not include this contextual discrepancy. Instead, as feminist standpoint epistemology and other policy analysis critiques articulate [Lindblom, 1980; Majone, 1989; Stone, 1988], partisanship is an

inherent part of policy analysis. Indeed, the analyst must become conversant with (and see!) the political context in which he or she must choose the policy analysis framework. This may *initially* include the methodological expectations of the audience, but it also allows for a broader range of methods (tool selection) to be used. Unlike Bobrow and Dryzek's [1987] argument that "...frames are to be used rather than believed or routinely applied," feminist standpoint epistemology proffers that use, belief, and application are integrally connected [210]. Thus, by articulating and accepting the partisan, socially constructed aspect of tool selection, feminist standpoint epistemology removes the confounded theoretical and applicative elements expounded by Bobrow and Dryzek.

Another element of policy design that requires clarification is the construct of power. The Bobrow and Dryzek construction of policy design argues that only the critical policy analysis framework, derivative of critical enlightenment epistemology, is capable of actualizing such a strategic approach. As has already been illustrated, Bobrow and Dryzek's formulation disregards the import of other critical theories, such as feminism. They suggest that such theories are too focused upon political interests and are thereby entrenched in their own narrow political agenda. Ironically, they argue that these theories focus upon "liberation," exactly what the authors purport critical policy analysis aims to do. Yet, somehow a feminist assertion of liberation is pejorative while their own espousal of this same goal is deemed favorably. This illustrates how Bobrow and Dryzek perpetuate the false dichotomies originally presented within the rationalist and positivist epistemological stances which they deride. Not only do they continue the Self/Other dichotomy, but in so doing, entrench their theory in power structures. A contextual policy design containing such

exclusionary constructs cannot attain goals of inclusivity, flexibility, or expanded participation. Rather, it continues the socially constructed hierarchical/patriarchal power structures which feminist standpoint epistemology dismantles. Thus, using feminist standpoint as a new lens to view policy design reveals the potential for a more democratic and inclusive process of policy analysis.

ACTUALIZING THE METATHEORY OF POLICY DESIGN

The reconceptualization thus far has focused upon theoretical and epistemological concerns. How does such metatheorizing relate to the "real world" or application of policy analysis? Can participatory and inclusive theoretical meta-visions be actualized? Indeed, a number of practical implications of this meta-level construction exist, expanding upon deLeon's [1992] cautious affirmative to such queries. The two most prominent regard the actors involved and the methods used within policy analysis. Policy design would not be a complete enterprise without a discussion of such practical elements.

Many actors participate in the policy process. Unlike Bobrow and Dryzek's [1987] dichotomization of the policy process, a feminist reformulation minimizes (if not removes) the barriers between the process's internal and external aspects. Rather than regard the policy process as merely an exercise within (internal) and between specialists, the feminist reformulation expands the context to include other actors; e.g., citizen groups. Although not alone in making this claim [Lindblom, 1980; Majone, 1989; Stone, 1988], the feminist perspective's contextual expansion goes beyond previous formulations. It not only breaks down this categorization, but also expands the inclusivity of policy actors with regard to

contextual issues such as sex, class, and race. Here, then, is the crux of the feminist reformulation: personal experience, i.e., Haraway's [1991] "partial positioning," becomes *a part of* the process rather than *apart from* the process. The particularly compelling practical consequence of this is the need for greater participation of marginalized groups. As Clarke and Kathlene [1992] illustrate, women's role as policy analysts and political actors can have a variety of influences upon decision making and policy formulation. Thus, creating a more representative political participatory context can (and does) have profound effects upon policy design and its resulting policy outcomes. No longer is feminist standpoint epistemology "merely" an academic meta-level exercise.

Not only does a feminist meta-theory have practical implications for the actors involved, but it also expands the pallet of tool selection. Incorporating feminist methods enhances policy analysis by increasing its sensitivity to the myriad of contextual settings an analyst encounters. Although there are a number of feminist research methods and techniques within feminist literature, many other discourses do not incorporate them. If policy design is to meet its goals of expanded participation, increased flexibility, and spectral inclusivity, then it must incorporate alternative methods. In other words, it must neither simply rely upon the positivistic methods of the social sciences, nor on a narrow selection of critical enlightenment methods, i.e., ala Habermas. Instead, policy design literature and policy analysts themselves must begin to discuss the significance of cross-cultural, action, and multiple methods research [Devault, 1990; Fonow and Cook, 1991; Reinharz, 1992]. Not only should these methods be discussed, but they should be implemented. Methods such as cluster analysis, content analysis, and feminist interview techniques need to be employed

because they are ***designed*** to be inclusive. This not only minimizes the marginalization of participants, but also expands the discursive context of policy analysis - again, one of Bobrow and Dryzek's [1987] original goals for policy design.

Although feminist methods are arguably an important strength within the construction of a feasible policy design framework, it should not be assumed that this analysis posits them as the "savior" or "only" means by which knowledge accumulation can be attained. Policy analysts, as well as others in the policy process, need to be aware of the complexities and problems which feminist research entails [Acker, Barry, Essveld, 1991]. Additionally, other methodological approaches, such as those highlighted by Bobrow and Dryzek, must also be understood by the policy analyst. The contextual nature of policy issues requires that tool selection opportunities be as broad-based as possible. No doubt, this increases the demands placed upon the analyst, but there are some potential alternatives to overburdening each individual analyst. Specifically, creating working groups of analysts could expand the research and analysis techniques used. Increasing the policy and political actors also makes the canvas of tool selection more manageable. Inclusivity not only minimizes marginalization, but also increases the potential of methodological diversity. Future research on the policy process, policy analysis, and policy design will help clarify and ground these preliminary suggestions.

As has been discussed, clarifying the construction of epistemological stances has practical aspects for the policy process and the methods used therein. The separation of theory and practice is problematic since they both are integral to policy outcomes. In the case of policy design, the false dichotomies profoundly impact the practical aspects because

they perpetuate the marginalization of particular groups. As such, they inhibit the goals of inclusivity and participation inherent in the policy design schema. Feminist standpoint epistemology provides a means to move beyond these limitations.

The practical potential of feminist theory, grounded in feminist standpoint epistemology, can be illustrated via a case study. The example offered here is a continuation of Bobrow and Dryzek's [1987] hypothetical scenario in which a community, Smoke Valley, must contend with an environmental policy problem, air pollution. Representatives of the other "frame of reference," grounded in their concomitant "knowledge orientation," each attempted to address the policy problem. Since each frame looked at the problem solely form its own perspective, denying the import of policy design's contextual criterion, no remediation occurred. The following section highlights how feminist theory, grounded in standpoint epistemology, can be used as an integral component of policy design.

REVISITING SMOKE VALLEY: A FEMINIST FORMULATION

Although a number of academics, politicians, and community groups continue to wrestle with the environmental pollution concerns of Smoke Valley, no policy resolution has yet been achieved. In many of the situations, the experts made their suggestions only to encounter institutional or political barriers to their policy initiatives. Each approach has its own limitations, and combining these with the political realities of decision making only further hinders the actual policy making process. Feeling pressured by interest groups, industry, and the public for a resolution, Smoke Valley's local government officials decided to ask the Department of Women's Studies at Smoketown University to initiate their proposal

submitted months before. Initially, the local government officials doubted the relevance of a feminist perspective for the community's environmental policy concerns; however, increased public complaints about birth related problems as well as women-oriented diseases from environmental stress convinced officials that women may indeed have a contribution to make. Thus, the Women's Studies Department organized a colloquium to begin a roundtable discussion of the issues involved --intended as an inclusive gathering, free daycare, handicap accessibility, and sliding scale registration fees were guaranteed.

At the roundtable, the general parameters of the situation were reviewed:

> Smoketown is a city of 300 thousand people nestled in a valley in the Misty Mountains. The local economy includes both heavy, smokestack industry (notably steel mills) and more modern, light industrial plants. Air pollution in Smoke Valley is severe. Aside from the emissions of manufacturing industry, Smoketown has two large coal-fired power stations (which burn the local high-sulphur coal). There is only a rudimentary public transportation system, hence most people travel by car, and automobile exhaust fumes contribute to pollution. In addition, Smoke Valley residents have wood-burning stoves in their homes, the Misty Mountains being heavily forested. The topography of Smoke Valley facilitates temperature inversions, which exacerbate air quality problems....Local residents grumble about eye irritation, smog, and high morbidity rates from respiratory disease....The mayor and city council have mixed feelings: on the one hand, they do not want to lose the heavy industries; but on the other, they are aware that a pleasant environment is an important factor in attracting the high-technology industry they are trying to entice to the Silicon Smoke Industrial Park [Bobrow and Dryzek, 1987:22-23].

The colloquium participants included women and men from a variety of social, political, and economic backgrounds: politicians, academics, steel mill workers, union activists, retired residents, college students, et al. Although the roundtable was sponsored by the Women's Studies Department, it specifically invited all of the other university departments, hoping to help mend the rift that appeared due to the Sociology and Economics Departments tussle regarding the environmental issue. Lydia Sturgess, the colloquium's organizer and

consensually chosen spokesperson, reviewed the department's intentions by addressing the importance of the feminist perspective as well as its application to policy design.

Ms Sturgess suggested that the context of the situation be assessed by experts as well as by community leaders, activists, and the public. Reminding the audience of the previously generated assessments (from the Departments of Economics, Sociology, and Philosophy), she suggested that these groups meet and discuss their respective positions in an open, public forum. Additionally, the Women's Studies Department would conduct in-depth surveys with community residents in order to determine their major concerns regarding environmental degradation, economic structuring, and political positioning. In so doing, the survey would be interactive panel studies and not simply a quantitative analysis of public opinion. Although this would require more time and monetary resources, Ms Sturgess contended that it would provide a more detailed contextual picture than any of the previous studies had constructed. Additionally, such a survey in conjunction with information gleened from citizenship panels [Crosby, Kelley, and Shaefer, 1986; Kathlene and Martin, 1991] would facilitate feedback and expand the public dialogue.

The proposed approach to assessing and addressing Smoke Valley's environmental concerns represents one "partial reality" of the situation. Camilla Rosenstein, curator of the Smoke Valley Women's Historical Society, suggested that the policy scenario's context and audience were critical components of a well-formulated policy design. As such, the proposal must consider the historical context of the social construction of target populations in the community, including a women's perspective. Ms Rosenstein credited her idea to a recent publication by Anne L. Schneider and Helen Ingram [1993] who argue that social

constructions of target groups greatly influence the policy process and can create special barriers to policy design if not addressed during the formulation stage. For instance, as the Martini's of the Sociology Department pin-pointed, the power structure of the government and community system not only has a large impact upon what types of policies are placed upon the agenda, but also which ones receive legitimacy or die of benign neglect [Bobrow and Dryzek, 1987:63]. Thus, no successful policy design can be implemented unless an understanding of the community's social and historical construction has been outlined.

As some of the participants became agitated by the social-oriented discussion, Nadine Chadwick, a feminist biologist from the Environmental Pollution Agency (EPA), spoke up about the technical aspects of pollution monitoring. In particular, she commented that the testing and regulations needed to be more encompassing of women. For instance, some of the pollution levels were set at rates which were more dangerous for women, especially pregnant women, than for men. Additionally, differing levels of certain toxic substances, i.e., lead, affected races in different ways and to differing degrees. Although the agency knew that different needs existed, most of the standards were based upon studies conducted according to male and/or caucasian physiological reactions to air and water pollution. Ms Chadwick suggested that an increased attachment to and understanding of the diversity of the population needed to be incorporated into the technical aspects of monitoring and regulating pollution emissions. As such, she volunteered to organize a section of technical experts, also willing to listen to public concerns, regarding a more inclusive and sensitive means of addressing pollution emissions for the ***entire*** Smoke Valley population.

Although impressed by the willingness of the "educated experts" to be more inclusive,

Regina Lovestrand, a single mother and women's advocate, voiced her concern regarding the structure and hierarchy of the Women's Studies proposal. Would there be committees with slated chairs coordinating the policy forum decision making and environmental assessments? Were decisions to be consensually determined? How long would it take before the group actually had a "Plan of Action" to present to the local city council? These questions had been raised within the Women's Studies faculty prior to the colloquium and needed to be answered in this setting.

Ms Sturgess continued the dialogue by first stressing the importance of diversity and inclusivity. The Women's Studies Department desired to be a facilitator and coordinator of women's (and men's) concerns regarding the environmental pollution issue; however, it did not intend to be at the apex of decision making. Instead, it believed that the participants at the roundtable would follow through with the next step of the colloquium and organize themselves according to their interests and expertise, thereby covering many of the issues already discussed. Making the topics and committees more participatory would diversify the dialogue and expand the contextual understanding of the community and the situation. Decisions regarding policy design proposals would need to be coordinated and approved by the various committees. Although this would slow the process, it would also guarantee that the process was as democratic and non-hierarchical as possible. Considering that the policy would have to be approved and implemented by a hierarchical body, the city council, the participants would need to keep this reality in mind and construct a pragmatic, inclusive proposal.

Having discussed the strengths and weaknesses of a feminist approach to Smoke

Valley's pollution concerns, the colloquium participants broke into small groups and began to construct the committees obliged to contend with the complexity of the Smoke Valley environmental policy dispute. Although no policy decisions could be made in this initial setting, a number of positive results stemmed from the event. First, the dialogue among the participants created a more community-oriented atmosphere. Second, feminist concerns were finally addressed and had the potential of becoming a critical factor in pollution controls. Third, a diversity of standpoints was articulated and respected, creating a more inclusive and participatory communicative setting. Fourth, the importance of context was stressed, reminding the community that coordination and sensitivity was a must for a successful policy to be implemented. Fifth, other methods of resolution were not ignored but rather included in the dialogue, thereby bridging gaps between technical, epistemological, and methodological approaches. Whether the colloquium's success actually translates into a viable policy design and public policy success depends upon the ability of the participants to maintain an open dialogue and a sustained motivational factor. These aspects were just as important in the other Smoke Valley resolution attempts, so future success becomes very dependent upon personal commitment and political strategizing. Only time (and future pleas for Smoke Valley scenarios!) will reveal the final outcome. Until then, it is clear that a feminist perspective can and ought to contribute to technical and social aspects of public policy design.

CONCLUSIONS

Policy design from a feminist standpoint perspective proffers a radical framework

from which policy analysis can be conducted. Its goals are similar to those expounded by Bobrow and Dryzek [1987]: increased participation, expanded flexibility, and enhanced inclusivity. All of these correspond to a belief in expanded participatory democracy within policy making and public policy overall.

This analysis synthesized two theoretical discussions lacking any previous interchange. Thus, a dialogue between two discourses has been actualized. Although the majority of the essay focuses upon meta-level concerns such as the "theory of theory" within epistemological stances, practical and application concerns are also addressed, especially via the Smoke Valley example. The significance of including presently marginalized actors cannot be overstated. This *must* occur if policy design, and public policy itself, are to become more inclusive. The arguments here do not guarantee that the policy decisions and outcomes will be perfect. Indeed, compromise and tensions will continue to be inherent components of the process. What *is* asserted here is that the continuation of the status quo decision making processes and policy analysis frameworks will only continue to enhance tensions between the elite and marginalized populations in society. To remain wedded to such a hierarchical power structure *will guarantee* continued fragmented and contextually blind (if not complete failure) of public policy, particularly in social policy concerns.

If the goals of policy design are to be taken seriously, then a reformulation, such as the one presented here, must be implemented. Beginning an academic dialogue between two theoretical discourses is only a preliminary step. Expanding the community of policy analysts and political actors as well as incorporating a broader spectrum of methods must be employed if more inclusive public policies are to be generated. Whether these critical

components of policy design will be attained is now dependent upon the degree to which tolerance and respect exist in the academic, professional, and political arenas. *Caveat emptor*!

The Use of Negative and Positive Liberty in Ronald Dworkin's Defense of Pornography: A Critique

Mark G. Robeck
Roosevelt University
Policy Studies
Chicago, Illinois

Prepared for delivery at the 1993 Annual Meeting
of the American Political Science Association,
The Washington Hilton, September 2-5, 1993.

Ronald Dworkin has criticized Frank Michelman and Catharine MacKinnon for suggesting that pornography, given its form and anti-woman message, silences women's democratic participation and that an increase in women's political voice depends on its prohibition.[1] Dworkin bases his critique on what he says is a misapprehension on the part of the anti-pornography crowd about what is an opportunity for a choice-making and the conditions that enable one to make use of that opportunity. According to Dworkin, they have mistakenly equated negative and positive liberty, a mistake which Isaiah Berlin says we should not still be making.[2] The mistake lies in the claim that the state has a role in re-socializing or integrating a citizen into a particular type of society which seeks to have everyone in perfect sync with the society as a whole. And to a liberal that full-blown version of positive liberty does seem to confine paternalistically, and therefore unreasonably, the personal liberty of adult citizens.

In critiquing this misuse of positive liberty, Dworkin assumes two things: first, that any person has a right to express herself in a manner that offends another person; and, secondly, that all offensive expression should have equal First Amendment protection. So no matter what form the offensive expression takes, it can be constitutionally protected as it is imposed on others who are, by definition, offended by it.[3]

Dworkin's analysis seems, however, to conflate two different senses of the word, "offense," e.g., "I take offense to the message about some state of affairs" versus "That you would express that in this forum is offensive to my person." The conflation of these two senses of the word offense means that Dworkin constitutional assumptions that constitute his anti-paternalistic stance are overbroad, for they not only censure state action that suppresses fundamental freedoms of expression but also sweep into their ambit for censure actions that would open up opportunities for expression that have been coercively and unreasonably closed-off. In particular, the question of where and when obscene (or graphically or explicitly lewd) sexual expression is permissible has not been resolved by Dworkin's references to Berlin because his references do not adequately address how the imposition of obscene sexual materials affects a captive audience. Being offended is only a manifestation of a problem for this type of captive audience. The root problem is that they are unable to respond

---

adequately to those impositions of expressions because the form given the special role that expression plays in sexual activity doesn't allow them to choose from among a rage of activities into which or out of which they can reasonably enter or exit, and to do so reflectively, i.e., as a consenting sexual being. So, concerning their choice about their sexuality, the act of imposing the explicit sexual material onto a member of a captive audience withdraws the equal (or minimal) respect which is due to a person in a liberal system.

This argument about choice is not, as some might suspect, a selective use of words to hide some protection of a favored moral stance, viz., a religiously or morally based anti-libertarianism with respect to sexuality that is said to protect the average citizen from falling short of obtaining her "real" self. That would entail the re-socialization of adults to their "true" sexuality or the active enabling of them to one particular manner of being sexual. Instead, all that is called for here is a standard for explicitness of sexual expression for captive audiences so that members of those audiences can choose the moral or ideological tone in which they express themselves and submit themselves in the midst of their sexual activities, which could very well be in some cases "immoral," but, say, shaped and shared solely with partners of their own choosing.

The way in which explicit sexual expression is integrally involved in sexual practices differs significantly from the way that speech (even ideologically offensive speech) is used in other situations with respect to its related practices. In short, because explicit sexual expression is uncommonly integral to actual sexual practices, any potential audience with respect to this expression will have an interest in pre-sorting the character, as well as the time, place, and even co-auditors, of the expression which they allow themselves to receive. If they are not given that privilege of saying what is unwelcome, they are unreasonably burdened with a continual setting and enforcing of sexual boundaries, a state of nature fight so to speak, in which the bullies will prevail in illiberally setting the tone and outlook of the explicit sexual expression in public and do so at a level and manner that is conducive to satisfying their own particular sexual form of life.

One's sexual self-definition is not something that is impervious to "severe of pervasive" sexual harassment, including the unwelcome use explicit sexual materials. So the inability to respond is not a failing or excuse, as Dworkin would have us believe, on the part of the captive audience in these instances. Rather, it is a reasonable response to the direct manipulation of an important aspect of any person's life that is carried out in a public (interpersonal) situation by the imposing, i.e., coercive, party. The costs to the coerced party arises from the unreasonable choices forced upon them: (1) to leave and maintain one's person sexual self-definition, but lose income or professional opportunities; or (2) to stay for the money, experience or social contacts by adapting to the sexual pressures by inhibiting one's sexual persona and reorienting oneself to a defensive or deadened position with respect to sexuality and by avoiding persons or places that are particularly hostile in one's workplace which in turn subverts one's on-the-job

performance.

So if we take Dworkin's version of offense to others for granted, we might condone theoretical stances and legal standards that actually reduce or suppress the opportunities of a significant proportion of the population, granting coercive private power to those who already enjoy greater opportunities for sexual expression and activities.

But by analyzing the notions of negative and positive liberty with respect to expression in general, and sexual expression in particular, we can understand better what does and does not contribute to more rather than less choice among the significant practices that persons can participate in.

The following analysis will be liberal or anti-paternalistic in emphasis but responsive to the question of critical theorists of a feminist and communitarian sort. Some of the broad assumptions are the following: As a liberal I will grant the importance of socialization as a liberal citizen, not limited to formal education, which enables self-definition and self-protection for that citizen as an adult from offensive, i.e., radically challenging, forms of life and their related expressions. However, also as a liberal I would oppose a state policy designed to re-socialize, with penalties and incentives, individuals into as a favored sectarian practice which enables a particular form of life to flourish, while significantly penalizing those choices which lead to all other forms of life. And finally, I will recognize that some activities and the expressions thereof are such that the expressions are part of the very practice, and so their unwelcome, pervasive use when others are captive denies these others the reasonable choice of how to socialize themselves in an on-going manner; instead, they have to adapt to or adjust for the standards presumptively and illiberally set by others.

Some expression may be simultaneously "offensive" to a particular form of life and "coercive" with respect to individual choices of a plan of life. This means that we, as liberals, must oppose regulations that are tailored to suit the former concern to the neglect of the latter. However, we should not censure regulations tailored to protect the former concern, as does Dworkin, *in a way that* conflates, or insufficiently separates, the former and latter concerns. Finally, we should not censure regulations specifically tailored to address the latter concern in an even-handed way (not to favor the former concern over its opponents) but which incidentally provides the parties of the former concern MORE FREEDOM from the coercion of their opponents. Remember, this freedom from coercion in public places in no way guarantees that the purported members of a certain ideological group will not, when on their own, actually participate in practices that are, as they personally adjudge them, conducive to their own well-being, even though they are ideologically offensive to their purported social leaders.

A liberal position then should protect a self-directed enculturation into sexual practices which allows a person to ascertain what her needs are and how to adapt

her practices both to meet her needs and to gain greater perspicuity on her own affairs, especially how she wants to integrate her sexuality into other aspects of her personal plan of life.

The policy concern: regulating pornography

The question arises "What should public policy be concerning the use of pornography?" But the answers, according to Dworkin, fall into two groups: (1) those that are paternalistic, which second guess the choices of others or which step in to enable others where they asked for no help or do not need it, or (2) those that respect the choices made by individuals. With respect of policy suggestions concerning pornography, Dworkin says that Catharine MacKinnon and Frank Michelman fall into the first category and that he himself following Isaiah Berlin falls into the second.[4] And while for the most part I agree with Dworkin's critique of Michelman's stance and especially MacKinnon's stance on pornography, I think that he has failed to spell out how and why it is legitimate for a liberal to secure the regulation of pornography in the manner of zoning it off for consenting adults only.

Catharine MacKinnon has said that the production, distribution, and use of pornography is a systematic practice of discrimination. Pornography is here defined as the explicit sexual subordination of women in words or pictures. This claim of hers rests on the notion that the use, and all that precedes it which makes it possible, combines a bigoted idea with a sexual response such that that idea becomes the basis of reality for its users. Furthermore, even for those persons who do not use pornography, the effects of such use are said to be pervasive. First, the non-users generally assume that the bigoted idea about women is not tied to the particular use of the user and that, for the most part, those who use pornography probably held such bigoted beliefs before they began using it. Furthermore, the belief is thought to be the initial reason why they sought this explicit sexual type of expression. Finally, the non-users assume that this bigoted idea is an integral part of the user's sexual attitude, not something to second guess, say when adjudging on a jury the causes of a user's discriminatory practice, else one fall into a paternalism with respect to sexuality. So, according to MacKinnon, the use of pornography and the condoning of such use makes the tasks unnecessarily difficult for those who want to secure a non-discriminatory world for women.[5]

Functionally, the pornography as defined is offensive in both of senses of the word that I want to differentiate. First, it is explicit sexual expression of the

---

[4]Dworkin, "Liberty and Pornography," 12-15; "The Coming Battles over Free Speech," *New York Review of Books*, 39, no.11 (June 11, 1992): 55-64; *Matter of Principle*, (Cambridge: Harvard University Press, 1985), 335-72.

[5]MacKinnon, "Francis Biddle's Sister," 163-197.

form that one would use first and foremost in the midst of sexual activity. Secondly, it is ideologically offensive to the world view of MacKinnon and others who want women to live in a world in which they do not have to settle for a subordinate status as a citizen or as a sexual being. In short, its message is that "when women say no they mean yes because by nature they unconditionally want to say yes." Generally, MacKinnon's objection to the pornography is not to is form but to its message. Though she would seek civil penalties for those persons who force pornography on what we traditionally call "captive audiences," she claims that the effect of the use of pornography on women lies in its propensity to control the prevailing attitude toward women in their daily lives, an attitude to which they must accommodate, and to some extent acquiesce, in order to sustain themselves. This acquiescence, in turn, further legitimizes and entrenches that discriminatory attitude toward women, making it a basis for decisions concerning them, including how and to what extent the citizenry accepts them as fully participating members of the democratic process. In a sense, this bigoted attitude is maintained in many members of society in an irrational manner (sexual response). And because of its persistence as an attitude, it is then condoned as if it were an attitude "freely chosen" and "reflectively held" by individuals who have "rationally" acknowledged and accommodated all evidence to the contrary, that evidence being that women are not by nature sexually subordinate. So a systematic practice of bias against women is instituted without any trace of intentional action, and yet it robs women of any significant say in the governing of their lives.

As Dworkin notes, this argument is one that claims that pornography revokes women's positive liberty, i.e., someone else is governing their affairs.[6] Under this rationale, it would not matter if consenting men and women were prohibited from following through on an opportunity to sexually subordinate women, i.e., if their negative liberty were delimited, because that limitation would enable the women to control more of what was "really" important to them. Dworkin, of course, finds this argument grossly restrictive of the liberty of men and women and paternalistic towards the choices of women. When someone says that you as a member of some group can join a group decision about how to regulate personal choices, that someone is selling "group authority" over one's life as if it were somehow "personally liberating." But in order to respect individuals, we must place control over personal affairs back with the individual themselves, acknowledging their right to agree with those messages and conform to the practices that are ideologically offensive to many members of a class of which they are purportedly a member.

Because MacKinnon's argument rests upon policy proposals that mostly counter the content of the message, I would have to agree with Dworkin that there is little in her novel policy suggestions (outside the force, or "captive audience" provision) that a theorist who maintains a healthy respect for individual choice can

---

[6]Dworkin, "Liberty and Pornography," 12-13.

support.

Michelman's argument is that American constitutional law seems to give a free pass to "privately engineered ideological manipulation" because its traditional public-private distinction maintains that state restriction of viewpoints is always a greater danger than any private restriction thereof.[7] But Michelman wants to know why that distinction provides for greater liberty, if *arguendo* MacKinnon's claims that pornography disables its opponents' speech are correct. For in that case the very use of pornography by men makes them unable to hear and acknowledge women's appeals to the contrary.[8] This practical, if not literal, silencing of women's voices that run counter to the pornographic message means that women are unable, in Dworkin's gloss, to exercise their negative liberty to express themselves.[9] Michelman claims that situations can occur in which no state action means that less liberty is available for exercise, so we ought to be able to opt out of the public-private distinction in these cases.

> [S]o long as the state can fairly support a judgment that the infringements of liberty and equal protection consequent upon its choice for regulation of pornography are, in some appropriate sense, lesser than the infringements of liberty and equal protection consequent upon the opposite choice to leave pornography unregulated, that pro-regulation choice by the state would seem to come as close as humanly possible to good-faith compliance with the constitutional mandate. {footnote deleted}[10]

Dworkin's response is that what Michelman is proposing is not a simple securing of opportunities for negative liberty. It is, instead, rather a securing of a particular viewpoint. That others won't listen is not a reduction of one's negative liberty to speak but rather an inability to exercise with the hoped for result the negative liberty that one has.

However, both Michelman and Dworkin have overlooked a case of state regulation of speech (which I think they both would agree to) that fulfills the liberty producing conditions mentioned in the quotation above. That case is the zoning of the use of explicit sexual expression to those circumstances in which there is no captive audience. Dworkin does not oppose zoning or display regulations because they do not significantly reduce the negative liberty, but he does not explain why these regulations are legitimate ones given the unlimited right to offend one's

fellow citizen.[11] His acceptance must rest in the implicit recognition that offense to a particular form of expression is of a different kind from that of the offense to the message of any given expression. Michelman, for his part, does not explain how the regulation of pornography for its highly effective way of making its message stick with a willing audience reduces the opportunities to speak in women (the objects of the material) more than it increases the opportunities of its users to speak or even to act. Without at least some such argument, his policy recommendation about the regulating willing use of pornography seems only to trade one person's negative liberty for another's.

The political theoretical concern: negative and positive liberty

In order to understand how restricting the use of explicit sexual expression is conducive to positive liberty in an unproblematic manner, one must first grasp the standard theoretical arguments about why each is important. Once stated, I can then show that a liberal could favor such a restriction because it supports a sense of positive liberty that Isaiah Berlin says is intimately related to negative liberty, i.e., a freedom to set one's own agenda, and to follow it where it may lead, all of which is enabled by suppressing the bullying of others.[12]

When one has negative liberty, one is free from constraint, particularly governmental constraint. As one's negative liberty increases, one's avenues for action increase in number and become wider. The fundamental question concerning negative liberty is the following: "Over what areas of my life do I have control?" When one has positive liberty, one is free to do something or enabled to carry out a whole set of practices that, but for the enabling condition, one might never have been able to accomplish. The fundamental question here is the following: "By whom am I governed?"[13]

Though these concepts can overlap - in fact they cannot, according to Berlin, be kept wholly distinct - the controversy with respect to these concepts arises, according to Isaiah Berlin, because the positive action which enables the

[12]Berlin, "Introduction," *Four Essays on Liberty*, lvi. Consider the issue of a captive audience to explicit sexual expression in light of what Berlin says more generally in the following from "Two Concepts of Liberty," 165-66: "[T]here are frontiers, not artificially drawn, with which men should be inviolable, these frontiers being defined in terms of rules so long and widely accepted that their observance has entered into the very conception of what it is to be a normal human being, and, therefore, also of what it is to act inhumanly or insanely; rules of which it would be absurd to say, for example, that they could be abrogated by some formal procedure on the part of some court or sovereign body. When I speak of a man as being normal, a part of what I mean is that he could not break these rules easily, without a qualm of revulsion."

[13]Berlin, "Two Concepts of Liberty," 130-31.

positive liberty to do some such thing comes in many forms and with many different rationales.[14] The most problematic of these is the rationalist position towards positive liberty which states that one must have the desires of one's lower or empirical self restrained in order to enable one's higher or real or ideal self to come into being. And the decisions about what desires are to be suppressed can be discovered through reasoning, and what has be discovered by the best mind follows for all other purported rational being. As a consequence of this rationalist rationale, this enabling of a personal positive freedom has, in Berlin's words, been a trade-off of one's freedom for another's authority.[15]

A less authoritarian rationale for positive liberty comes from Charles Taylor. He says that in our post-Romantic era we no longer think that there exists one perfect, rational life for all beings. Rather, we think that there is something that is unique to each individual.[16] Still, one's insignificant desires often form internal obstacles to the self that you avow to be. But without the enabling of others' judgment and guidance one might never overcome those internal obstacles that keep one from being the best you can be.[17] One problem with Taylor's notion is that he confuses the rather uncontroversial claim that there are significant aspects of life without which life would not be worth living and which could not be obtained without others enabling one to overcome one's internal obstacles, with the more questionable unstated implication that it is somehow the state's responsibility to address these issues. And if it is not the state's responsibility then his analysis is of little help in determining when and if the state should enable an individual to gain control over her own life.

What enabling is a state responsibility? And which form of enabling will leave the most control to the individual person? The answers to these questions lie in the particular conditions in which individuals can participate in purposeful social activity and in the capacity developed by those individuals therein to express themselves at the most personal level. Where those conditions are blocked to adult citizens by highwaymen or bullies, the state may have a role in clearing the way for individuals to make choices that are suited to their own needs. And where the internal obstacles to choice are intimately related to the external actions of others, the state may also have a role for regulation. Otherwise, the state may have to pass on any particular action, if it is to remain true to its liberal spirit.

[17]Taylor, "What's Wrong with Negative Liberty," 181-93.

The key: expression and its relation to practices

One of the chief points of contention between liberals and communitarians has been the question of whether or how much individuals must be enculturated if they are to develop the capacity for making any choices. Though by the late 1980s these theorists seemed to have found some common ground,[18] at least theoretically, that, of course, every person would have to be socialized as they are reared else they would have no freedom of any value, they (and especially the non-theorists they represent) seem to part company when it comes time to draw the line on governmental efforts that would be deemed unreasonably paternalistic.

In a sense, more theoretical work has to be done in order for the theorists to evaluate what enabling actually puts authority back into the hands of the individual adults (an uncontroversial form of positive liberty) and what enabling robs those individuals of choices that they may make (the more problematic form for liberals). The key to this further theoretical work can be found in an analysis of the role that practical activity plays in the development of expression and of the way that individuals can use that language ability to reflect on their situation so as to re-engage themselves into other practices.

Within this analysis, we should especially attend to how, once individuals are sufficiently socialized and thereby articulate, they exercise their capacity and under what conditions they need exposure to expressions of alternative forms of life to be re-socialized into another form of life in any given sphere of life. In the next section, I will examine how the role of explicit sexual expression is fundamentally different from the role that expression play as part of other practical activity.

From whence comes expression? When we express ourselves, we emphasize one thing rather than another. In other words, we demonstrate what we value in the practices in which we involve ourselves. So as we are being socialized we participate in a form of life that our elders have decided to involve us in, and we come to emphasize those things that they find of particular importance. As we then express ourselves, we express our commitment to that form of life. Ultimately, though, as adults our commitment and the concomitant expressions will emphasize the values of a personally tailored plan of life.

In the socialization, we do not primarily learn our vocabulary through the means of ostensive definition that organizes items in our environment that are "present-at-hand" for de-engaged analysis. Rather, words are used to judge actions within practices into which our desires are channeled. We develop a

---

[18]For a concise review of the debate see Charles Taylor's "Cross-Purposes: The Liberal-Communitarian Debate," in *Liberalism and the Moral Life*, Nancy Rosenblum, editor, (Cambridge: Harvard University Press, 1989), 159-82, 279-81.

vocabulary about things that are "ready-to-hand" tools in these practices. Our elders, then, are our mentors, and we speak with them about what we have done. But because the discussions are a means of judging how well we have participated in the practices, they are expressive of the commitment to such practices. And the articulation of words for what is what and what is in its proper place is not separated in the first instances of using the words to express a value. These brief comments are a gloss, then, on the role of the language in enculturation - or as some would say - socialization. The words with which we will come to reason with about the world and the choices we will make are initially acquired in our participation in socializing practices.[19]

We can see then that socialization is necessary for the capacity to reason. Socialization is not simply a matter of rote learning else the practices could not serve a practical purpose in our daily lives as children. And at play we can even use the words in a forum where that use is initiated by ourselves. We can even assume the authority roles as well and direct the action of others as a co-mentors of a sort. But the story-line expresses inchoate values, i.e., the play may not be a completely scripted replication of the way the socialized practices have been introduced to them.

By the time of adolescence we have been well-versed in the do's and don't's of action and the reasons for so acting. But this greater sophistication within the socialized practices allows us to be rather articulate about the reasons given for the practices themselves - and - therefore, we can discern that authority figures themselves seemingly do not "practices what they preach."

As adolescents, we recognize that our own desires can be more than simply channeled into existing practices. Instead, the desires can motivate the creation of a practice - or more likely - a reorganization of existing practices - to allow a less inhibited satisfaction of the desires. As "reformers," however, we are implicitly aware of a problem that arises with all important social practices; namely, this new, provisional "form of life" (if you can call it that at this point), developed with our cohorts, need not only facilitate the gratification of our most pressing desires but it must also come to respect others' needs and choices. But these details are often not addressed, so they are not articulated beyond the "if-you-don't-bother-me-you're-cool-by-me" attitude. Obviously, with this lacuna in the social practice, it is not meant to be anything more than a way station for learning the art of acting with others to establish new practices when the need arises. But at the level of language and thought, we develop with our co-participants subtle uses for words that are not understood by others because the practices in which they are used have been developed for and by our peers to express *inter alia* the standing of our

---

[19]Ludwig Wittgenstein, *Philosophical Investigations*, 3d ed. G.E.M. Anscombe, trans., (New York: Macmillan, 1968), #1 and Part I passim. For more detailed examples of language acquisition from a Wittgensteinian point of view *see* Hanna Pitkin's *Wittgenstein and Justice* (Berkeley: University of California Press, 1972), 30-36, 55-70.

co-participants in this group and the value of the particular desires that have been countenance and therefore fulfilled within.

Socialization enables both the fulfillment of desires and the development of our language ability through our submission to and understanding and use of the judgments expressed about our participation. As the means and ends of the practices become clearer to us as participants, we can then reason, i.e., reflect, about our desires and the practices chosen which can be conducive to our fulfillment of these desires. This choice about practices itself becomes more settled, and done with more sobriety, as we become fully responsible for ourselves, including how we respect the choices of others with whom we disagree.

The manner that these choices are made fits the model of the liberal citizen choosing her personal plan of life, thereby integrating what can be integrated of practices developed in various spheres of life: work (or profession), leisure, religious life, and social relations and family life. Given a pluralistic society, the choice is made from the various forms with which one is acquainted in each sphere. And we commit ourselves to those that seem conducive to what we understand to be our needs given our desires and circumstances at present and in the future.

In this model of the self-directing, though not disengaged, liberal citizens, we are seemingly well equipped with words to express our commitments as well as our grievances, when these commitments are frustrated. The ability to "grieve" a problem, however, entails more than simply thinking to ourselves about what values/commitments have been frustrated and then translating that analysis into a public language to which others can respond. Rather, the grievances themselves can be made only when the pains/frustrations are articulated with other like-situated persons so that they become, as Wittgenstein suggests, really "known" and not merely "felt."[20]

So in order to act upon the choice of practices, even in our personal plans of life, we must associate with others who are similarly engaged so that we can be articulate and therefore know, in a useful sense of being able to reflect upon, that to which we are committed. As any liberal theorist would admit, the choices of a liberal citizen are not made from nothing in some sort of frictionless social vacuum.[21] We are, in fact, participating in a form of life in each sphere of our lives. And it should not, therefore, be surprising that the personal plans of lives among individuals, from one sphere to the next, are often similar throughout.

---

[20]Wittgenstein, *Philosophical Investigations*, #246.

[21]Stanley I. Benn, *A Theory of Freedom*, (Cambridge University Press, 1988), 179-80.

But what distinguishes us from what Stanley Benn calls the "heteronomous, though integrated" individual,[22] what some might call a "true believer"? Such a person has values that are completely chosen by others. But his life is so integrated into one totalizing form of life that it suits him well. The world is coherent for him, the reasons for troubles have been well-articulated, and his task is basically one of re-committing himself in better ways to that form of life, trying to understand even more about it and what it has to offer.

In contrast, the "more" autonomous, or liberal, individual makes the choice to commit to new or reformed practices based primarily on her understanding of her needs and of the others who are willing to associate with her in this sphere of their lives. So her personal plan of life, characterized by her involvement in a particular form of life in each sphere, is not constituted as a single, totalizing form of life as it is with the true believer mentioned above. In any one given sphere, this liberal individual will still seek mutual support for her actions - in the manner of an openness to criticism, an acknowledgement of error, and the acceptance of encouragement to continue with the practices of this particular form.

Others, favoring alternative forms, may argue against the form in which this liberal is presently engaged, claiming that her commitment to it is incoherent, if not basically contradicted by more fundamental beliefs that she claims to be committed to. Or they may claim that, if not confronted by others here and now, she could be encouraged by the wrong people to commit herself to some incoherent beliefs. The expressions in such an argument may be diametrically opposed - or in Harry Kalven's words "ideologically offensive"[23] - to her present form of life in which she is engaged. But in this act of persuasion, we can see the value of what Dworkin calls the "freedom to offend" others, because the defense of that freedom in paradigmatic cases entails a respect for both the speaker and the auditor as fellow citizens, who may persuade one another to choose the form of life in which they are engaged and, one persuaded, to make it an essential part of their personal plans of life.

And Dworkin insists, persuasively, at least as a general rule, that to the extent that our society is liberal, we should not insulate adults from ideologically offensive expression because such action smacks of a paternalism which we only should countenance with respect to children. And even there, whenever possible, we should transfer these paternalistic duties directly into the parents' hands from that of the government.[24] First, parents guide their children for their own

---

protection and until they have the social wherewithal to take care of themselves. Secondly, parents also want to nurture a particular interest in a form of life which they themselves have found rewarding. Thirdly, the parents know that their children need continuity in their socialization, even without it being presented as a "life-sentence," which they can provide by cutting off the possibility of continual choice-making about fundamental matters of their lives. The benefits from such a regimen is an ability to speak about, discern, and reason about nuanced aspects of a form of life. The parents' hope is that the child will thereby be a more responsive citizen as an adult than they would have been without such a commitment to a form of life. Lastly, parents may simply want their own household to be free from conflicting forms of life so that they can receive some of the benefits of continuity in forms that have been tailored to gratify effectively, coherently, and respectfully their own most pressing needs and desires.

Paternalism, however, becomes a dubious ploy when it is applied to adults because it undermines the opportunities for choice that not only allow adults to enjoy themselves but also to be responsive citizens. If the state closes off a form of life because it is thought not to be conducive to an individual following her "better" natural inclinations, the individual only develops, as Milton has put it, a "cloistered virtue,"[25] which is subject to disintegration at the first significant test of its commitment. And civicly, such an individual will grow dependent on governmental protection from ideologically offensive expression. As a result, she will seek to stop the expression the public expression thereof simply for her own benefit, disregarding for the most part any respect due to other adult citizens who have no other opportunity to be persuaded by it if they had only heard it.

What is important to take note of about the freedom to offend others ideologically is that the expressions are made either <u>about</u> the manner of the speaker's or a cohort's participation in the practice or <u>about</u> the form of life itself, i.e., claiming <u>that</u> it has value for her and <u>that</u> it would benefit or otherwise enrich the auditor's personal plan of life. The first sense of expression is one that is internal to the practices themselves, expressing either a judgment about the extent, or quality, or manner of the involvement. Yet the expression, though it facilitates further action, is itself conceptually distinct, as the second sense obviously is, from the committed actions it facilitates.

This point will be pivotally important in my argument below about explicit sexual materials, because I will argue that such materials, such expressions, are not conceptually distinct from the practices. In most non-sexual practices, the expression itself is not <u>constitutive</u> of the practice itself. Even in the socialization of sexual roles the expressions that relate the commitments to important public behavior are not constitutive of the practice and are qualitatively different from

[25]John Milton, "Aeropagitica," in *Aeropagitica and Of Education*, George H. Sabine, editor, (New York: Appleton-Century-Crofts, 1951), 18.

those expressions used in the midst of sexual activity.

For example, a former beauty queen may be asked to coach a friend's daughter in the fine art of preparing for and participating in a beauty contest. The statements made to the young woman may be ideologically offensive to feminists who hear them, but the comments of her coach simply facilitate, but do not constitute, an aspect of her very participation in the contest. And as such she can, in a moment of crisis, find that the feminist comments to the contrary are more in keeping with what she wants to commit herself to.

The difference: explicit sexual expression and sexual practice

Explicit sexual expression has a qualitatively different relation to sexual practices than the expression discussed above. And I will draw support for the contention from the defense of the personal use of explicit sexual expression by sexual libertines; namely, that such expression is integral to and constitutive of the sexual practice, that the willing participants in sexual practices cannot reach their sexual goal without it. Such expression does not merely relate judgments about how the practice was performed. That type of mentoring discussion may occur for some before or after or in the pauses during the activity, but not in the midst of the practice. To recognize the difference, we should review then the developmental model of expression with regard to practices, but this time, with a focus on sexual practices.

First of all, parents usually do not practically assist their children in the particularities of how to get the best effect in sexual activities, either as a coach and most certainly not as a sexual surrogate, as they would assist them in the brushing of their teeth or the conjugation of regular verbs. Instead, whenever parents speak to children about sexuality, it is in the form of commands to (most often) curtail it: "Don't do that at all, or at least not in public," though the activity is sometimes ignored or permissively condoned. The expressions about the sexuality of a child are in neither instance constitutive of the activity; rather, they set forth the penalties for exceeding the boundaries of acceptable sexual behavior for their age and maturity, penalties being paid for in a loss of some non-sexual privilege or pleasure.

However, if the expression of the adults (whether parents or guardians or others) is directed to the child as a passively overwhelmed co-participant in a sexual act, we would call this child sexual abuse, even if the adult espoused a pedophilic philosophy that somehow claimed that it was "good" for children's sexual development. And if the adult exposed a child to the explicit sexual expression that is constitutive of sexual practice, but did not touch her, we would still say that the adult was abusive of the child, if not technical guilty of child sexual abuse under a particular state law.

Among adults the expressions about sexuality become even more of a

concern with respect to their own and others' adolescents. These adults recognize that adolescents can make sexual choices on their own, though they often irresponsibly discount too much the possible future consequences of the sexual activity in which they choose to participate. In these circumstances, the parents' statements about sexuality often express a paternalistic control of either an authoritarian or a humanist sort.

The authoritarian parents continue to control the adolescent as they did the young child. In particular, the statements about sexuality express a strict set of boundaries and penalties for exceeding those boundaries, about whether to participate in sexual activities at all, how much is too much and too fast, and with whom and in which circumstances. Furthermore, the authoritarian parents try to censor the explicit sexual expression that their children may be exposed to because it may be conducive to premature sexual activity. The paternalistic goal of this censorship is to slow down the adolescents' involvement in sexual activities for their own well-being. And the only statements made concerning sexuality are those made <u>about</u> what not to do.

The humanistic parents take a paternalistic stance but without setting forth specific moral guidelines. Their statements to their adolescents concern how to approach a potential sexual situation maturely and when to determine that a purported choice to engage in sexual activity is being coercively pressured. The parents control the adolescents' activities as much as they can in order to secure that the latter's psychological and physical well-being, knowing full well that the adolescents need to be under less and less parental control with each sexual choice they successfully negotiate.

The humanistic parents speak <u>about</u> sexuality to their adolescents without using expressions that would be used in a sexual activity, except in some very carefully framed situations where they may report in heavy quotation marks the type of expression that goes on (which would still be speaking <u>about</u> the practices that occur), so as to suggest to the adolescents that they be cognizant of the patterns and pressures of sexual practices and of the conditions under which mature decisions must be made.

Finally, we know of parent/adolescent relationships in which no particular explicit sexual expression is directed toward the adolescents as passive co-participants but where "sowing one's wild oats" is encouraged. Such statements <u>express</u> something <u>about</u> sexual practices but are not in themselves constitutive <u>of</u> such practices.

Of course, encouraging this cavalier attitude toward sexuality does not sit well with the paternalistically oriented parents, particularly those who propound an authoritarian perspective. But this brief discussion about towards whom we may legitimately take paternalistic stances about sexuality suggests that when these adolescents reach the age of majority they will no longer be proxies in the

ideological fight among their parents, but real players with real decisions to make about the form of sexual life that they will lead. As with their parents, they will live in a society in which any given attitude toward sexuality will face ideological opponents who will express ideologically offensive claims about sexuality. The others may say that they participate in certain sexual practices or in non-explicit terms say that they enjoy such activities, implying that everyone else should as well. Their audience may be offended by their sexual form of life, but members of that audience are not thereby obstructed from following their own sexual practices.

The reason that they are not obstructed by the ideologically offensive statements about sexuality lies in the fact that these statements, or expressions if you will, are not constitutive of those practices in which its practitioners participate. They only emphatically report that they do X and thereby imply that others could also choose to do so.

Paternalism with respect to adults is illegitimate even concerning the volatile issue of sexuality because it seeks to do more than enable a choice. It seeks to guarantee that one sexual form of life is chosen over another. And in the more subdued form of paternalism, it may still seek to guarantee that the individual choose from among "healthy" alternative forms of life. But this, too, is paternalistic because its aim is to stop adults from choosing certain sexual practices for their own good.

But this paternalistic enabling of particular sexual practices differs from the protection of adults from sexual harassment, and even sexual harassment in the form of explicit sexual expressions. Why this is the case lies in the differences spelled out in the stories about development of non-sexual and sexual practices. With explicit sexual expression, one does not simply state what is to be done, then do it, and then express how it felt. Rather, the practice itself entails expression, i.e., the expression is constitutive of the practice. (Once again, this is a point made by sexual libertines when they say that their practices are constrained by across-the-board censorship.)

Sexual expression is a choice of every individual and most particularly every adult. Socialization may circumscribe what activities are permissible morally, especially for children, and with respect to health. And public policy, employment patterns, and marriage laws may also constrain what sexual practices individuals choose, including how, where, when, and with whom they are sexually active. But this socialization does not involve the making of explicit sexual expressions that are constitutive of sexual practice.

With respect to choosing, or committing oneself to, a sexuality, one develops at one's own pace. One chooses one's own partner(s). Furthermore, one is allowed to disengage oneself from a sexual partner and even, if the practice isn't to one's liking, in the midst of the sexual practice. Part of being a sexual

participant is learning to be responsive to sexual expressions in one's own way. Once again, little practical advice can be given by third parties in the midst of the sexual practice. And one makes and submits oneself to these explicit sexual expressions on the assumption that consent between the co-participants has been acknowledged and secured.

Explicit sexual materials are produced, packaged, and distributed as, say, newspapers and magazines that themselves might make ideologically offensive statements about the world or even about sexuality. And as such these latter media are protected by constitutional guarantees of freedom of the press and speech which are based philosophically on a respect for the choice-making ability of the writer and of the readers. However, although the explicit sexual material may also entail ideologically offensive viewpoints about sexuality, they are primarily used as proxies for individual expressions that might arise spontaneously in a sexualized situation, a situation in which the consent to being exposed to that expression as constitutive of the practice has already been acknowledged and secured. For example, the material can be used as an imaginative tool, viz., a masturbatory aid. It could also be used as an "ice-breaker" for consenting participants to facilitate their own sexual expression and practices.

Or it can be used coercively to sexualize situations around individuals who are not consensual partners, either at that moment or at any time. It is coercive because the material is imposed on a captive audience of unwilling co-participants to a sexualized situation in which their own bodies are implicitly referenced, such referencing being the particular object of explicit sexual material among consenting parties.[26] The "offense" of being a captive to the presentation of explicit sexual materials is <u>not</u> primarily to the <u>ideological message about</u> the favored sexuality - that it is constitutive of particular practice for someone else, that the values presented are contrary to one's own. Rather, it is to the <u>presumption</u> that one would agree to being expcsed to such material, ever, or while just anyone happens to be in the vicinity. One objects that one is entered into a matter, not negotiable in the time or place, in a manner that references oneself in the audience and which puts any of one's responses in a sexualized framework, subject to other cross-cutting demands of the original situation, e.g., the workplace. In short, one is offended by the lack of <u>respect</u> for one's person, one's most personal choices.

<u>Why zoning of explicit sexual materials is not paternalistic</u>

In terms of positive and negative liberty, then, enabling a person to make personal choices in a relatively non-coercive environment without second guessing

---

[26]See *Meritor Savings Bank v. Vinson*, 477 U.S. 57 (1985) for the first case in which the Supreme Court recognized the EEOC guidelines concerning a hostile or offensive workplace environment with respect to Title VII of the Civil Rights Act. See *Robinson v. Jacksonville Shipyards, Inc.*, 760 F.Supp. 1486 (M.D.Fla. 1991) for a case in which a Federal District Court recognized the pervasive presence of pornography as creating a hostile workplace.

those choices is not anything, I would think, that Berlin would have a problem with because it opens up more avenues for sexual choice. To explain this claim, I will spell out what sexual autonomy entails and why this seemingly temporary external obstacle can in reasonable person become an internal obstacle to choice, even when it is not present.

Although most of the practices in which we participate are socially constructed, sexual practice is the most personally constructed of any practice, even though one is fully cognizant of the ideological demands of others outside the bedroom door that concern the more public aspects of one's sexuality. Furthermore, that one has a developed sexuality of some sort is a fundamental aspect of one's personhood. So it is not something that, if it is unreasonably affected or impinged upon, we would write off as an unfortunate, yet permissible because tangential, imposition on one's being. Let's see then how this very important aspect of one's personhood is constructed.

First, one's body itself becomes the subject matter for and means of expressing one's commitment to the sexual partner - either at that moment or into some indefinite future. And by "commitment" I do not mean simply one's attestation of monogamy, but also the manner or tone with which one will relate with that partner.

Second, though I said it was the most personally constructed of any practice, I obviously did not mean to suggest that one's sexuality is not in an important respect defined by how one's partner expresses himself about one and one's body. And that partner's expression, in order to be anything other than a reflected fantasy dreamed up by oneself, must be initiated and volunteered by that partner.

But most importantly, sexual autonomy of the individual entails the permission to accept or reject that explicit expression of one's partner. And the acceptance of that expression, without rejection or contradiction, allows one to define one's own sexuality. And especially in terms of sexuality, what one has actively been or silently forced to be is what one is sexually. And one's sexual practices or habits become a means or obstacle for further involvement.

Certainly, a rape victim/survivor suffers a dignitary harm from her compelled participation in a sexual activity entirely of another's choosing. That harm may even outlast the bodily injuries inflicted in the attack. And, contrary to the line touted in the newspaper business, this dignitary harm is not somehow evaporated by overcoming the moral stigma and shame that society attaches to rape victims. That shame is largely constructed by and for a public that wants to blame women for asserting any liberty in their lives that may subject them to a higher level of sexual attack. But the dignitary harm of which I speak arises with or without that socially constructed expectation <u>about</u> women's sexuality because it arises from the fact that, at the personal level of sexual activity which is expressive of a

certain commitment to the other "participant," the person compelled has had her choice to accept or reject this manner of sexual relations ignored. The dignitary harm arises because one's sexual autonomy has not been respected. The appellation "rape survivor" is taken up to recognized her subsequent actions that make her a person who can counter the definition to which she was compelled to submit, i.e., as someone who can make sexual choices. But "survivor" not only connotes agency in response to a set-back, it also connotes the necessary work needed to overcome an obstacle, an obstacle that did not arise merely because one chose to take a particular construction on the matter. This analysis explains why penetration should not be the sole sign of sexual assault, of the undignifying revocation of one's sexual liberty.

Now any purported harm related to being a captive to explicit sexual materials does not, of course, compare with that of being raped or otherwise sexually assaulted. But it is on a continuum of situations that significantly constrain or hinder one's sexual autonomy.

First of all, by definition, a captive audience is present at the situation for some other important reason. Members of such an audience are usually not literally captive, i.e., they could get up, walk out the door, and never come back. But we say that they are "captive" in the sense that it is unreasonable for them either to endure whatever environmental insult may occur in order to acquire what they are primarily there for or to avoid the insult and thereby forego that primary good. Usually, that location is their workplace, a place where they gain their material livelihood, which, in turn, enables them to act in the marketplace in those "avenues" a liberal economy holds open to them. A job also allows someone the means to sustain themselves, something which may, Berlin might say, be hard to translate into freedom but which necessarily holds a fundamental place in those things that any society values.

Secondly, this other, or rather primary, reason for being in the situation carries with it burdens that are related to the tasks involved therein. These tasks - such as fulling one's duties and maintaining a civil, courteous, and cooperative comportment in the workplace - are severely stressed when, say, explicit sexual materials, of the kind that are usually "expressed" or used only in one's most personal realm, are imposed on such a worker. In this situation the tasks related to both important spheres of one's life conflict. One must be present at the workplace but submitting oneself to severe or pervasive (EEOC, Meritor, and Robinson) exposure to explicit sexual materials means that one is allowing others to define one's sexuality. This claim does not mean that there is nothing one can do to counter these obstacles to defining one's own sexuality. But the fact that it is an obstacle does mean the one must do more than avert one's eyes or divert one's attention away. One must work at one's job and simultaneously project a persona that is both indifferent to the material but yet not hostile to those who impose it. Furthermore, that persona which one quite literally embodies during the workday then becomes an obstacle with which one has to deal and overcome in

one's own voluntary sexual relations.

For those unconvinced, who might say that the explicit sexual expression is an annoyance but not an obstacle, I would ask that you reflect on whether you haven't simple grown accustomed to spending time and energy undoing the coerced social construction of one's personal sexuality or trying to ignore the coercion of others. Consider the supposed option to say more than that the exposure to the materials is unwelcome. As when faced with merely ideologically offensive expression, one could respond to an explicit sexual expression with one's own explicit sexual expression (and I don't mean profanity which is a hostile way of saying that it is unwelcome). This option is a non-starter for the person who did not want to be engaging with co-workers about her personal sexual proclivities in the first place. In a situation that is actually conducive to sexual choice one does not "debate" in this graphic form extremely hostile and antithetical options, though some pornography has such a fantastical story line. That simply isn't the logic of the manner of expression between consenting partners who express their commitment to engage themselves sexually. Rather, it is a give and take process in which each participant accepts any expression offered and further engages herself, or reject it and disengages.

Yet another complaint may arise from those who say, with a Marcusean flourish, that one's natural sexuality has traditionally been shunted and constrained into a domestic hideaway by a "logic of domination" while one toils at work in an alienated, inhuman, de-sexualized environment which one must endure simply to sustain oneself. Gratification has been allowed only when it can be contained, controlled, and re-directed by the powers that be.[27]

This claim is a sweeping indictment of a type of a form of life, instituted and controlled by the government or by market moguls, a paternalism of the politically most coercive kind. But it is not relevant to the question at hand unless it is reduced to a pointed comment of the following sort:

> It seems a matter of who it is that must change or alter their sexual persona to the detriment of their own sexual autonomy - those who need to be explicitly expressive about it in public and those who need to be so in private. Either one group or the other is going to shut down an important aspect of themselves if the others regulate this "discourse" in the workplace.

This conflict arises, though, only because the Marcusean model assumes that an explicit sexual expression that is omnipresent is somehow compatible with sexual autonomy. According to Marcuse, the domination of sexuality arises because someone has the power to take the role of the authoritarian parent with respect to others' sexual desires. If only that "parent," or rather "father," could be removed then everyone could be free to express himself with others as they see fit.

---

[27]Herbert Marcuse, *Eros and Civilization,* (Boston: Beacon Press, 1955), 106-26.

What is lacking in this Marcusean analysis is any realistic understanding of what would be necessary for those negotiations about sexual partners to be non-coercive given that sexuality so unhindered, by his own analysis, would not be well suited to, or respectful of, boundaries. In my analysis, non-coercive negotiations about sexuality start off with the respect granted to the other person to choose not to get into a sexually defined situation, and once in it, to disengaged from it if it does fit her liking.

Finally, let's deal with the most straightforward claim about the extent to which explicit sexual materials affect the sexuality of those who are pervasively captive to it AFTER they leave that place of captivity. These persons are only asked to do what employees and students do with respect their bosses' or professors' opinions about their work. Employees have to act like they agree with their bosses during the workday and then come home and need to unwind and reclaim their own view about their work. Similarly, student in classes generally admit to saying what they think the professor wants to hear or write what he wants to read, academic freedom and their own viewpoints notwithstanding. If these impositions on integrated personality are said to be reasonable, then certainly, one might think, the exposure to explicit sexual materials is not any more pervasive nor more unreasonably undone at home.

The answer to this challenge lies in the relative personal nature of the matter to which the individual must submit herself, whether it is to the boss's views about work tasks or to her professor's views about a subject. At work, one can in no way expect the prevailing perceptions about one's task to suit one's personality for the requirements of that task are to some extent even beyond the control of one's boss who ultimately is constrained by the opinions and money of those who pay for the goods and services provided. At school, the tasks are not merely ones of personal expression, even at the higher levels. In any class, there is a body of knowledge that is presented to the students in the form of facts, principles, and argumentation. The student's primary task is to master this very socially constructed material, material that the professor has selected from work that has received critical peer review. To the extent that some professors would irresponsibly fail to present such material and instead present a series of personal impression, he is not carrying though his pedagogical task. However, it does not follow from this dereliction of duty that the students should take classes in order to express, first and foremost, their personal feelings.

But with sexuality the manner in which someone engages herself, including to what explicit sexual expression she regularly must submit herself, should be subject to her own choosing and to do otherwise would be unreasonable. This should be so, in Berlin's terms, if we favor increasing and broadening the avenues for sexual activity open to her. For this aspect of our lives is <u>the</u> personal expression that should be the least subject to the social control of either the bullying sexual libertine or the conservative social moralist. This pervasive exposure to explicit sexual materials is not simply an annoyance, it is an obstacle

because much time and concerted effort is required to undo its internal correlate, the defensive persona which one had little choice but to embody. And I mean "embody" because in this sexually framed situation one's body is present when one is captive and it is implicitly referenced by the material. The body is the means of this expression, even in the state of complying with it. Hence, the enjoyment and expression of one's sexuality on terms to which one would consent has thereby been constricted and narrowed. When severe or pervasive, this imposition becomes a significant dignitary harm because it ignores the choice of whether to be a party to these particular sexualized situations.

So the choice for a liberal-minded public is whether the unlimited explicit sexual expression in all places is most conducive to maintain opportunities for fellow citizens to exercise their sexuality without coercion, or whether placing barriers to unwelcome explicit sexual expression, where others may be part of a "captive audience," allows for a broader base of opportunities for sexual expression, excepting those opportunities that could be gotten from these coercive situations. I think that the latter policy is one that opens more sexual avenues of the fundamentally important kind - where the answer to the positive liberty question of "By whom am I govern?" is confined to you, not extended to include the rationalist philosopher or tyrant who determines what is rational and "truly fulfilling" for all beings nor extended to include those schoolyard or workplace bullies with the equally presumptive "you-know-you-want-it" demeanor. This policy also increases the opportunities for involvement in activities, which have been subject to this type of coercion of captive audiences, viz., employment opportunities.

As noted at the top, Michelman and MacKinnon claim that this type of expression, when coupled with an ideologically offensive <u>message</u>, has been used to harass women and to silence them such that they cannot participate effectively in the democratic process. In some instances women are intimidated from speaking up and in other ones women are simply ignored. But, following my analysis, I can only claim that this coercive <u>form</u> of expression, e.g., at the workplace, directly affects the employment opportunities that one is reasonably eligible (Benn) to exercise as well as directly obstructing one's own sexuality. But if, and this is a big if, that coercion does <u>not</u> occur as women discuss among themselves and organize and participate in the democratic process, then the effect is only an indirect one, measured in proportion to the lack of reasonably eligible employment opportunities and or the amount of sexual intimidation and how much they unnecessarily consume one's time and energy otherwise allocated to politics. Being obstructed in these spheres of life doesn't mean that one cannot participate in the democratic process, for the primary purpose of democratic participation assumes that obstructions will arise for various groups at various time about which they will petition for redress. And to the extent that women are in the political process, they can "grieve" the infringement of the personal sexual autonomy of women and the harassment in the workplace. By this I do not mean to suggest that women's participation is yet on an par with men's, but I don't think we can

paternalistically pre-judge where women's participation is coercively suppressed by favoring a certain democratic outcome. The answer lies in highlighting the systematic means of coercion as well as the extent to which such impinges on rights and freedoms in others spheres and then responding by democratically restricting such coercion as it is discovered and delineated.

Furthermore, from my analysis one cannot claim that the culprit is the ideologically offensive content of the material, whether in or out of that form that I would restrict for captive audiences. Now it may be in fact that women experience more constraint from the joining of the ideologically offensive content with this explicit sexual form which make up pornography. But that ideological message should not be what is pivotal because respect for any given individual means that we not pre-determine which attitude that individual should take. To do so would, as Dworkin suggests, separate further the notions of negative and positive liberty until that latter notion itself becomes more a form of authority than of liberty.

However, Dworkin must himself explain why he claims that one has the right to offend another, while granting that the zoning of explicit sexual expression is sometimes permissible. His answer must rest on more than a political compromise that allows the politically sophisticated liberal elite to consume "serious" explicit sexual works and view nude ballets while letting the conservative moralists to protect their neighborhoods from the blight of porn shops - or nude dancing in bars - where the less politically astute citizens find their opportunities lost in the shuffle.[28] Rather, it must rest on the principle that recognizes the particular coercive nature of the imposition of explicit sexual expressions on a captive audience. That coercion can silence someone in the proximate concern of their work and sexuality and indirectly affect their democratic participation. Alternatively, a liberal respect for individuals that places the highest value on keeping the notions of negative and positive liberty working in conjunction will not pre-determine which option that the individuals should ultimately pursue in their work, their sexuality, or in their democratic participation.

A final corollary of this principle is that no matter what the ideological bent, and as long as they are non-coercively produced, the sexual materials that consenting adults choose to use out be as explicit as they want and therefore free

[28] *Miller v. California*, 413 U.S. 15, (1973) (containing the Burger Court's retrenchment on the obscenity standard); *Young v. American Mini Theatres, Inc.*, 427 U.S. 50 (1976) (upholding a Detroit Anti-Skid Row Ordinance which sought to separate "adult" establishments of various kinds); *Renton v. Playtime Theatres, Inc.*, 475 U.S. 41 (1986) (upholding an ordinance that keeps adult theaters at least 1000 feet from residences, schools, and churches); and *Barnes v. Glen Theatre, Inc.*, 111 S.Ct. 2456 (1991) (upholding an Indiana law prohibiting nude dancing in liquor establishments). Given my argument in this paper, I have no particular problem with the decision in *Young* and *Renton*. *Miller*, however, intensifies a double-standard with respect to social class that was present in modern obscenity law, and *Glen Theatre* is an offspring of such a rationale.

from any regulation that infringes upon their bedrooms, their theaters, their sexual autonomy.

Future challenges from critical feminist theory

Given my analysis that addresses the coercive use of a particular form of sexual expression, what can we say about the use of pornography in the home of a married couple where the man introduces it and the woman would rather that it not be imposed on her by her husband?

In one sense, though a marriage contract no longer means that consent to any activity is automatically granted, it may imply, assuming an on-going agreement to co-habitate, consent to the introduction of these materials for acceptance or rejection by the other party. And in that sense the expressive materials might be considered to be comparable to the expression that the husband could initiate with his own sexual actions or voice. Any major differences in approach to sexuality between the two parties, then, could be a sign of sexual incompatibility that any marriage is subject to.

On the other hand, if the husband persists in imposing the material on his wife despite her stated dislike of it, one might say that he is directly constraining the sexual opportunities of his wife by using expressions, which he could not so readily and persistently conjure up on his own, to set the tone of the sexual relations between them, playing of the fact that other factors - such as economic interdependence - keeps her from opting out of the relationship.

Discounting the fact that either party may find other partners with which to sexually engage themselves, I would think, given this preliminary perusal of the question, that an uneasy stalemate might actually ensue between them because the presence of marital rape and spousal abuse laws and their rationale of needing to get consent to complete an activity with the other means that the wife need not follow through with any of these attempts to initiate sexual activity of this particular kind. Hence, it seems that the government might have no additional role to play in the unhappy domestic state of affair beyond the guidelines already in place concerning spousal abuse, marital rape, and if not co-habitating, stalking.

A Revealed Preference Analysis of Hegemonic Stability Theory

ABSTRACT

Hegemonic stability theory has received much attention in the international political economy literature recently. According to the theory, periods of high concentration of economic power in one actor in the political economy are highly correlated with periods of stability, openness and general economic well being. Until now, most analyses of this theory have focused on finding aggregate empirical evidence of this correlation.

Although behavioral expectations are imbedded in the theory, no one has examined whether hegemons act like hegemons in their relationships with other members of the political economy. This paper first axiomatically derives the interactive behaviors that are expected on the part of the hegemon. A unique method for events data research is then used to determine if the US acted like a hegemon during the 1950's - the period when its concentration of economic power was at its greatest.

The results are enlightening. Hegemonic stability theory is derived from the theory of the public good. Accordingly, the hegemon should have the preferences of a "latent" group and be willing to provide the public good of system stability in the face of free riding by other actors. The analysis of events from 1948 to 1978 shows that in economic interactions with other industrialized countries, the US was significantly more likely to "cooperate" in response to "defection" prior to 1960 than it was after 1960. This behavioral phenomenon seems to imply that during the 1950's the US acted like a hegemon - providing the public good of economic openness, enforcement, and stability without regard for contributions from other states.

A Revealed Preference Analysis of Hegemonic Stability Theory

Introduction

What does a hegemon do? Recent literature in international political economy has focused attention on the apparent relationship between the existence of a hegemon and general stability and growth in the world economy. This phenomenon has been discussed broadly under the concepts of hegemonic stability theory. Many authors have attempted to validate this correlation by examining time series data that show that periods of growth and stability correspond with concentration of economic power under one strong actor.[1] The economic growth and stability among the industrialized economies of the later half of the 19th century has been attributed to the hegemony of Great Britain and the general prosperity after World War II has been attributed to the hegemony of the United States. Little attention has been paid, however, to the strategic behavior that is expected of a hegemon when it interacts with other actors in the international economy. That is, did Great Britain and the United States act like hegemons in their interactions in the world economy?

The obvious prior step in this analysis is to derive the expected strategic behavior for the hegemon and other actors from the premises of hegemonic stability theory. This paper will derive those behaviors by treating international economic stability as a public good. Within this context, the hegemon is what Mancur Olson (1965) described as a member of a privileged group and the other actors are members of either intermediate or latent groups. Preference functions of members of these three groups will be axiomatically derived and used to define the range of possible outcomes in dyadic international economic relations. If the US behaved like a hegemon in postwar years, then its dyadic interactive behavior should conform to that of

a privileged group member facing either an intermediate group member or a latent group member. Many hegemonic stability theorists posit that the US lost hegemonic power sometime after 1960. If the theory holds, there should be a noticeable shift in US interactive behavior sometime after 1960 as the US changed from a privileged actor to an intermediate or latent group member. US dyadic interactive behavior will be tested using a unique methodology applied to the COPDAB events dataset.

Hegemonic Stability Theory

The basis for hegemonic stability theory was set out in Charles Kindleberger's analysis of the great depression of the 1930's. Kindleberger believed that

> "the 1929 depression was so wide, so deep, and so long because the international economic system was rendered unstable by British inability and United States unwillingness to assume responsibility for stabilizing it in three particulars: (a) maintaining a relatively open market for distress goods; (b) providing counter cyclical long term lending; (c) and discounting in crisis." (1973, 291-292)

His general conclusion that "The world economic system was unstable unless some country stabilized it," became the heart of the hegemonic stability thesis. That thesis was clearly stated by Robert Keohane.

> "hegemonic structures of power, dominated by a single country, are most conducive to the development of international regimes whose rules are relatively precise and well obeyed. According to the theory the decline of hegemonic structures of power can be expected to presage a decline in the strength of corresponding international economic regimes." (1980, 132)

The logic of hegemonic stability is relatively straightforward. Generalized growth and prosperity in the liberal international economy require open competition and free trade. While these conditions may be advantageous for the collective of world economies, the policies that are necessary to create

and maintain an open international economy, such as removal of barriers to trade, may be viewed detrimental to the well-being of individual economies. Since it may be in the collective interest to create and maintain an open world economy but not in the interest of individual actors to pursue policies that will do so, the order will not be created without the influence of a hegemon which is willing and able to forego short term individual interests in favor of greater utility gained from the open economy. As Robert Gilpin (1987, 75) stated, "if there were no hegemonic power to create and manage international regimes, this theory suggests, the international economy would become unstable as liberalism and free trade gave way to the forces of economic nationalism."

Kindleberger believed the hegemon created stability by providing an import market for goods when international demand fell, providing a steady flow of capital even when business cycles turn toward investment contraction, and providing and maintaining the value of the primary currency for foreign exchange (1981, 247). Gilpin (1987, 75) provided a longer litany of the hegemon's effect on the international economy. The hegemon uses its influence to create regimes which "prescribe legitimate and proscribe illegitimate behavior in order to limit conflict, ensure equity, or facilitate agreement." According to Gilpin, the hegemon also prevents cheating and free riding, enforces rules, encourages other actors to participate in maintaining the system, prevents exploitation by states with monopoly power, encourages states to remove their trade barriers, provides an example of growth and of the benefits of the market system, and provides technology transfer for economic development.

Why does the hegemon engage in this behavior? Surely there are costs associated with policies designed to create and maintain the liberal economic order. Duncan Snidal (1985) identified two approaches to this question in the literature. He associated the work of Krasner and Gilpin with what he called "coercive leadership." The justification for hegemonic activities here lies primarily in the individual benefits that accrue to the hegemon instead of the general utility of a liberal economic order. Stephen Krasner (1975, 319) stated that the benefits that an individual state receives from an open trading system depends on the potential economic power of the state. This implies that all states do not equally view the liberal economic order provided by the hegemon as a "good." The hegemon benefits asymmetrically from the openness of the liberal economic order because of its size and potential economic power. Thus, it is in its own best interest to pursue policies that create openness and the "public good" of system maintenance is merely a by-product of this self-interest. Gilpin (1982) argued that the hegemon can use its economic power to extract payment for other services it provides the international system such as preservation of political stability. Snidal (1985, 587) characterized this behavior as a quasi-government that is able to provide the public good of economic stability while taxing the other actors in the system through coercion or threat of discontinuance of the stabilizing policies.

Snidal characterized Kindleberger and Keohane's approach to the hegemon as "benevolent leadership." The hegemon is unable to coerce or induce other actors to share in the costs of creating and maintaining stability and is unable to exclude their enjoyment of the benefits of the order. The hegemon pursues policies of stabilization because its economic power and position

permit it to receive long term benefits from the open order that exceed the short term costs of providing the order. The other actors "free-ride" on the benevolent actions of the hegemon.

The problem of creating and maintaining a liberal international economic order remains a problem of collective action regardless of which of these approaches is accepted as valid. Clearly, Snidal's characterization of the "benevolent leader" conforms to the basic premises of a collective action problem where the hegemon is what Mancur Olson (1965, 49-50) defined as a member of a privileged group. Such an actor will provide the public good alone because the utility received from the good exceeds the costs of providing the good. Krasner's assertion that the utility of an open liberal order is asymmetric does not remove the provision of the order from the realm of collective action. Perhaps not all members of the international system will benefit equally or at all from the openness of the system, but there are still those that will see the open system as a good. Among these, the problem is still one of how to provide the collective utility in the face of individual costs. Krasner's recognition of the asymmetric benefit acquired by the hegemon merely confirms the status of the hegemon as a privileged actor.

John Conybeare (1984) did present a serious challenge to the maintenance of the liberal international order as a collective action problem. A public good must have both the qualities of non-excludablity and joint supply. Non-excludablity implies that once the good is provided to a group, it is not possible to exclude any member of the group from enjoying the benefits of the good. Joint supply, or non-rivalry in consumption, means that free-riding does not alter another actor's decision to participate in the provision of the good or its enjoyment of the good's benefits. Conybeare (1984, 8) asserts

that the maintenance of the liberal international economy is not a public good largely because the benefits of the liberal economy are excludable.

> "Countries may, individually or collectively, penalize a country that attempts to impose a nationally advantageous tariff at the expense of the international community. Major trading powers, like the US, Japan, and the EEC, are quite capable of retaliating in such a way as to make the benefits of predatory trade practices an excludable good."

Joanne Gowa (1989, 314-315), while accepting Conybeare's claims that the benefits of free trade may be excludable, points out that enforcement of a free trade regime is itself a public good. That is, if one country punishes another that has imposed a predatory tariff, all members of a free trade regime will benefit if the offending country lifts its tariff while only the enforcer bears the costs.

Tests of hegemonic stability theory have focused primarily on time-series analyses that attempt to find a correlation between the existence of a hegemon and the relative stability and growth of the liberal international economy. Where these analyses have differed is in their definitions of the variables. The independent variable, hegemony, is often conceptualized as the concentration of economic power. Whether or not a hegemon exists in a particular period depends greatly on the analysts operationalization of this variable. Krasner (1975) operationalized potential economic power in terms of four variables: per capita income, aggregate size, share of world trade, and share of world investment. Using these variables he identifies three periods since 1800 in which changes in the concentration of economic power (hegemony) correspond with changes in the liberalism of the international economic order. From 1820-1879, increasing economic liberalization corresponded with increased economic concentration as Great Britain rose to the status of the hegemon. From 1880-1900 the declining potential economic power of Britain coincided

with a retraction of liberalization. From 1945-1960, increasing US potential economic power correlated with postwar liberalization of the international economy. Other periods, (1900-1913, 1918-1939, and 1960-present) did not conform to the expectations of hegemonic stability theory in Krasner's analysis.

In a more recent study, Edward Mansfield (1992) found more promising results. Mansfield used Gilpin's and Wallerstein's classifications to identify periods of British and US hegemony. Gilpin (1987) identified the period of British hegemony from 1815 to 1914 and US hegemony between 1945 to around 1980. Wallerstein (1983) identified British hegemony between 1815 to 1873 and US hegemony between 1945 to 1967. Mansfield estimated a quadratic model that estimated "how the level of global trade as a percentage of global production is affected by hegemony and by the concentration of capabilities among the major actors in the international system." (Mansfield 1992, 737) He found that a quadratic form of the model (non-linear) explained nearly 75% of the variance in trade as a function of the qualitative variable hegemony, and variables noting the level of concentration of power capabilities and number of major actors in the system.

One of the controversies in the hegemonic stability literature involves the current status of the US as hegemon. Many authors note that US hegemonic power declined at some point after 1960. Others, Joseph Nye (1990) most notable among them, believe that the US still wields hegemonic power in the international system.

Strategic Preferences in Collective Action

If the provision of system stability is a problem in collective action, then the task that now must be addressed is to derive the preferences of the hegemon in its dyadic interactions with other actors. Using Russell Hardin's (1971) logic, an individual's decision to provide or not provide a public good is based on a 2x2 variable sum game where the row player is the individual and the column player is perceived as a unitary actor representing the rest of the collective. Only the decision calculus of the individual (row player) is of interest in this game. The valuation of each outcome of this game, which is represented below, is based on Hardin's approach.

Let v = the supply of the good provided by each player that participates in the provision of the good.

c = the cost of the good incurred by the individual when the individual participates in providing the good.

N = the number of individuals in the collective, including the individual.

The resulting 2x2 variable sum game is shown in figure 1 in normal form with values representing the utility calculation only for the individual (row player).

		COLLECTIVE	
INDIVIDUAL		Provide Good (P)	Not Provide Good (N)
	Provide Good (P)	PP = Nv/N-c = v-c	PN = v/N-c
	Not Provide Good (N)	NP = (N-1)v/N = v-v/N	NN = 0

Figure 1. Utility calculation for the individual (row player) in a public goods decision.

With each of the members of the collective providing v units of the good, the total supply of the good is Nv. This value is then distributed across N members of the collective. Thus the value of the good distributed to each individual is v. The individual incurs c costs by participating in the provision of the good. Thus the utility for outcome PP is v-c.

If only the individual provides the good, the supply of the good will be v. This supply is distributed across N members of the collective due to the non-excludability of the good. The value of the good acquired by the individual is v/N and the individual incurs c costs. Thus the utility of outcome PN is v/N-c. In PN the individual is the sole provider of the good.

If all members of the collective provide the good except the individual, the supply of the good is (N-1)v. This supply is distributed to the N members of the collective and since the individual incurs no costs, the utility of outcome NP is (N-1)v/N which reduces to v-v/N. In NP, the individual is a free rider.

If neither the collective nor the individual supplies the good, the value is 0 and the cost is 0. In outcome NN, no public good is provided.

The utility calculations are based on the following assumptions about the values of v, c, and N:

Assumption #1:	v,c > 0	v > 0 => the commodity is a "good" c > 0 => there are real associated with the provision of the good.
Assumption #2:	{N>1}	N is an integer that is greater than one since it is a counting number representing a collective, not an individual.

Given these assumptions and the definitions of the individual utility values for each possible outcome (PP, PN, NP, and NN), the task is to derive all possible ordinal preference functions for an individual.

Theorem #1: PP > NP iff v > Nc

Proof: PP > NP => v-c > v-v/N

=> v/N-c > 0

=> v/N > c

=> v > Nc QED

Theorem #1 states that the individual will prefer joint supply of the good to free riding only when the value of its additional supply is greater than the total costs of providing the good. The logic of this situation is that the individual will participate in the provision of the good due to its desire not to lose the additional value that its own participation in the provision of the good adds to the total supply of the good. If this additional value is greater than the costs that are incurred, then the individual will prefer participating in the good with the rest of collective (PP) over free riding (NP).

Corollary #1.1: NP > PP iff Nc > v

Proof: NP > PP => v-v/N > v-c

=> 0 > v/N-c

=> c > v/N

=> Nc > v, QED.

If the costs of participation in the provision of the good are greater than the value of the additional supply, then the individual will prefer free riding (NP) over participating in providing the good with the rest of the collective.

Theorem 2: PP > PN

Proof: PP > PN => v-c > v/N-c

=> v > v/N

which is true for all v > 0 and N > 1, QED.

Theorem 2 states that joint participation in provision of the good is ALWAYS preferred to sole provision of the good. This is true and obvious because under sole provision, there is less total good supplied than with joint participation, yet the individual incurs the same cost.

Theorem #3: NP > PN

Proof: NP > PN => v-v/N > v/N-c

=> v+c > 2v/N

=> Nv + Nc > 2v

By Assumption #1, N $\geq$ 2. Thus
2v + 2c is the minimum of Nv + Nc and
since c>0 by Assumption #2,
2v + 2c > 2v QED.

Theorem #3 states that free riding (NP) is ALWAYS preferred to being the sole provider of the public good (PN).

Theorem #4: PN > NN iff v > Nc

Proof: PN > NN => v/N-c > 0

=> v/N > c

=> v > Nc QED

Theorem #4 states that sole provision of the good (PN) is preferred to no good being provided when the average value of the additional supply that is provided by the individual is greater than the costs that are incurred by being the sole supplier.

Corollary 4.1 NN > PN iff c > v/N

Proof: NN > PN => 0 > v/N-c

=> c > v/N QED

When the individual's costs are greater than the average value of the additional supply provided by the individual, the individual prefers no good to being the sole supplier.

Theorem 5: PP > NN iff v > c

Proof: PP > NN => v-c > 0

=> v > c QED

Joint provision of the good is preferred to no good being provided when the additional value provided by the individual is greater than the costs incurred by the individual's participation in providing the good.

Corollary 5.1 NN > PP iff c > v

Proof: NN > PP => 0 > v-c

=> c > v QED

When the individual costs of participating in providing the good are greater than the value of the additional supply of the good, the individual will prefer no good to joint participation in the provision of the good.

Theorem #6: NP > NN

Proof: NP > NN => v-v/N > 0

=> v > v/N

which is always true when v > 0 and N > 1, QED.

Theorem 6 states that free riding is always preferred over no good being produced. Since the commodity is a "good," the individual will always prefer supply to no supply when it does not have to pay any costs.

Theorem #7: If NP > PP then NN > PN

Proof: NP > PP => Nc > v by Corollary #1.1

Nc > v => NN > PN by Corollary #4.1, QED.

Corollary #7.1 If PP > NP then PN > NN

Proof: PP > NP => v > Nc by Theorem #1.

v > Nc => PN > NN by Theorem #4. QED

The 4! possible ordinal preference functions for the 2x2 variable sum game are shown in table 1. All but three of these preference functions can be eliminated from consideration due to the requirements of theorems 2, 3, 6, 7 or corollary 7.1. That is, no permutation in which PP>PN, NP>PN, NP>NN, NP>PP and PN>NN, or PP>NN and NN>PN can be a preference function given the arguments in the previous discussion.

Permutation	Possible	Reason
PP > PN > NP > NN	No	PN cannot be > NP (Theorem 3)
PP > PN > NN > NP	No	PN cannot be > NP (Theorem 3)
PP > NP > PN > NN	**Yes**	
PP > NP > NN > PN	No	If PP>NP, NN cannot be > PN (Corollary 7.1)
PP > NN > PN > NP	No	PN cannot be > NP (Theorem 3)
PP > NN > NP > PN	No	NN cannot be > NP (Theorem 6)
PN > PP > NP > NN	No	PN cannot be > PP (Theorem 2)
PN > PP > NN > NP	No	PN cannot be > PP (Theorem 2)
PN > NP > PP > NN	No	PN cannot be > PP (Theorem 2)
PN > NP > NN > PP	No	PN cannot be > PP (Theorem 2)
PN > NN > PP > NP	No	PN cannot be > PP (Theorem 2)
PN > NN > NP > PP	No	PN cannot be > PP (Theorem 2)
NP > PP > PN > NN	No	If NP>PP then PN cannot be > NN (Theorem 7)
NP > PP > NN > PN	**Yes**	
NP > PN > PP > NN	No	PN cannot be > PP (Theorem 2)
NP > PN > NN > PP	No	PN cannot be > PP (Theorem 2)
NP > NN > PP > PN	**Yes**	
NP > NN > PN > PP	No	PN cannot be > PP (Theorem 2)
NN > PP > PN > NP	No	NN cannot be > NP (Theorem 6)
NN > PP > NP > PN	No	NN cannot be > NP (Theorem 6)
NN > PN > PP > NP	No	NN cannot be > NP (Theorem 6)
NN > PN > NP > PP	No	NN cannot be > NP (Theorem 6)
NN > NP > PP > PN	No	NN cannot be > NP (Theorem 6)
NN > NP > PN > PP	No	NN cannot be > NP (Theorem 6)

Table 1. The 24 permutations of the 2x2 preference function.

The three possible preference functions are listed below along with the conditions under which they can occur.

1. Privileged Preference: PP > NP > PN > NN

   PP > NP => v > Nc (Theorem #1)
   PP > PN (Theorem #2)
   PP > NN => v > c (Theorem #5)
   NP > PN (Theorem #3)
   NP > NN (Theorem #6)
   PN > NN (Corollary #7.1)

Thus if an individual has the preference function PP > NP > PN > NN,

v > Nc > c.

This means that the value of the supply of the good that is added by the individual providing the good is perceived to be greater than the TOTAL costs of the collective providing the good, and higher than the individual costs of participating in providing the good. Since the additional value of participation is greater than the total costs of providing the good, the individual is willing to chance being the sole supplier of the good rather than forego the good altogether (PN>NN). This is Olson's definition of a "Privileged group"

> "A privileged group is a group such that each of its members, or at least some of them, has an incentive to see that the collective good is provided, even if he has to bear the full burden of providing it himself." (Olson 1965, 49-50)

2. Intermediate Preference: NP > PP > NN > PN

NP > PP =>	Nc > v	(Corollary 1.1)
NP > NN		(Theorem #6)
NP > PN		(Theorem #3)
PP > NN =>	v > c	(Theorem #5)
PP > PN		(Theorem #2)
NN > PN		(Theorem #7)

These conditions taken together imply that the individual's valuation of its additional supply when it participates in the provision of the good lies between the total costs of all individuals providing the good and the individual's own costs of participation.

Nc > v > c

In such a situation, the individual is willing to participate in joint provision of the good but is not willing to chance sole provision of the good. These conditions conform with Olson's definition of an "intermediate group."

> "An 'intermediate' group is a group in which no single member gets a share of the benefit sufficient to give him an incentive to provide the good himself, but which does not have so many members that no one member will notice whether any other member is or is not helping to provide the collective good." (Olson 1965, 50)

3. Latent Preference NP > NN > PP > PN

NP > NN	(Theorem #6)
NP > PP => Nc > v	(Corollary 1.1)
NP > PN	(Theorem #3)
NN > PP => c > v	(Corollary 5.1)
NN > PN	(Theorem #7)
PP > PN	(Theorem #2)

The individual's valuation is such that the value of its additional supply if it participates in the provision of the good is less than both the total costs of the provision of the good and less that its individual costs of participation.

Nc > c > v

In this case, the individual has no incentive to participate in the provision of the good either in cooperation with the collective or as the sole provider. These conditions define Olson's "latent group" which

> ". . . is distinguished by the fact that, if one member does or does not help provide the collective good, no other one member will be significantly affected and therefore none has any reason to react. Thus an individual in a 'latent' group, by definition, cannot make a noticeable contribution to any group effort, and since no one in the group will react if he makes no contribution, he has no incentive to contribute." (Olson 1965, 50)

It is now possible to determine which actor(s) will participate in the provision of a public good in dyadic international relations. Although each individual decision is made as though the individual faces the collective, international relations is played out as a series of dyadic one-on-one decisions. These decisions are documented as events in events datasets.

The three preference functions discussed above generate 6x6=36 games when paired with each other. However, of these 36 games, there are only six non-equivalent games. That is, there are only 6 games that cannot be generated by transposing rows and columns of another game.

The ordinal preference functions are noted for the row and column players in a 2x2 variable sum game in table 2 by numerical values where 4 is the most preferred outcome and 1 is the least preferred.

	4	3	2	1
1. Privileged (P):	PP	> PN	> NP	> NN
2. Intermediate (I):	NP	> PP	> NN	> PN
3. Latent (L):	NP	> NN	> PP	> PN

PLAYER STRATEGIES		ROW PLAYER PREFERENCE			COLUMN PLAYER PREFERENCE		
		1	2	3	1	2	3
Row Player	Column Player	P	I	L	P	I	L
Provide Good	Provide Good	4	3	2	4	3	2
	Not Provide	2	1	1	3	4	4
Not Provide	Provide Good	3	4	4	2	1	1
	Not Provide	1	2	3	1	2	3

Table 2. The three ordinal preference functions for row and column players in the 2x2 game.

The six non-equivalent games show what behavior is expected for each possible pairing of preference function. Each game is shown below in normal form. The value for the row player is listed first in the each pair of outcome values.

	Privileged: I. Provide Good		Privileged: II. Not Provide	
Privileged: A. Provide Good	4,4	PP	PN	2,3
B. Not Provide	3,2	NP	PP	1,1

Game 1. Privileged actor vs. privileged actor [#6].[3]

In game 1, row A dominates row B and column I dominates II. The solution is PP with a value of 4,4. In this pairing, both players provide the public good. Game 1 is what Rapoport and Guyer (1966) called a "no-conflict

game," meaning that the single Pareto optimal outcome is achieved and no player feels aggrieved by obtaining less than its maximum possible value.

Privileged:	Intermediate: I. Provide Good		II. Not Provide	
A. Provide Good	4,3	PP	PN	2,4
B. Not Provide	3,1	NP	NN	1,2

Game 2. Privileged vs. intermediate. [#31]

Row A dominates row B and column II dominates column I. The solution is PN and the value of the game is 2,4. The privileged player (row) provides the good while the intermediate player (column) does not. The solution to game 2 is threat vulnerable. That is, if the privileged player credibly threatens to discontinue providing the good, the intermediate player would logically move to participate in the provision of the good thus obtaining a score of 3 over the score of 2 that would be obtained if the threat is carried out and no good is provided.

Privileged:	Latent: I. Provide Good		II. Not Provide	
A. Provide Good	4,2	PP	PN	2,4
B. Not Provide	3,1	NP	NN	1,3

Game 3. Privileged actor vs. latent actor. [#17]

In game 3, row A dominates row B and column II dominates column I. The solution is PN with a value of 2,4. The privileged player (row) provides the good while the latent player (column) does not provide the good. The solution is stable. That is, although the privileged player is aggrieved, it can do

nothing within the bounds of the game to induce the latent player to participate in providing the good.[4]

	Intermediate: A. Provide Good		Intermediate: B. Not Provide	
Intermediate: A. Provide Good	3,3	PP	PN	1,4
B. Not Provide	4,1	NP	NN	2,2

Game 4. Intermediate actor vs. intermediate actor. [#12]

This is the prisoner's dilemma. In game 4, row B dominates row A and column II dominates column I. The single play solution is NN with a value of 2,2, which is a deficient equilibrium. Neither player provides the good.

The prisoner's dilemma illustrates how two self interested players following their own interests will come to an outcome which generates less utility than a cooperative outcome. Without negotiation or repeated play, the deficient outcome NN is dominant.

	Latent: I. Provide Good		Latent: II. Not Provide	
Intermediate: A. Provide Good	3,2	PP	PN	1,4
B. Not Provide	4,1	NP	NN	2,3

Game 5. Intermediate actor vs. latent actor. [#11]

In game 5, row B dominates row A and column II dominates column I. the solution is NN with an ordinal value of 2,3. Neither player provides the public good. The solution is strongly stable, meaning that there is nothing that either player can do within the context of the game to induce the other player to provide the public good.

Latent:	Latent: I. Provide Good		II. Not Provide	
A. Provide Good	2,2	PP	PN	1,4
B. Not Provide	4,1	NP	NN	3,3

Game 6. Latent actor vs. latent actor. [#9]

When a latent player faces a latent player, row B dominates row A and column II dominates column I. The solution is NN with an ordinal value of 3,3. Neither player provides the public good. There is nothing that either player can do within the context of the game to induce the other player to provide the public good.

The hegemon is constructed as a privileged actor in hegemonic stability theory. Snidal (1985, 581) justified this in terms of the hegemon's ability to "capture a share of the public good larger than the entire cost of providing it." Wallerstein defined the hegemon in terms of the advantages it gains from its relative superiority in efficiency such that it "will be the primary beneficiary of a maximally free world market." (Wallerstein 1980, 38) As the primary beneficiary, the hegemon has the greatest incentive to pursue policies that will create the free world market, even if it must pay the price for those policies alone. In the context of the previous discussion, the hegemon perceives the value it gains from its own provision of the public good of an open world economy to be greater than the total costs of policies and actions need to create and maintain the economy ($v > Nc > c$). Thus it would have the privileged preference function in dyadic interactions with other actors in the international economy (PP > NP > NP > NN).

Most other states do benefit from liberal international economy. They will differ, however, in the degree to which they can or are willing to affect that economy. Highly industrialized states generally conform to Olson's definition of an intermediate group where "no member got such a large benefit from the collective good that he had an interest in providing it even if he had to pay all the cost, but in which the individual was still so important in terms of the whole group that his contribution or lack of contribution to the group objective had a noticeable effect on the costs or benefits of others in the group." (Olson 1965, 44) In these states, the benefits of an open economic regime are greater than the individual costs of provision but are not so great as to make the state willing to chance sole provision (Nc>v>c). Such states would be willing to participate in the provision of the good if others participation could be guaranteed. These non-hegemonic industrialized states would have the intermediate preference function when interacting with other states in the world economy (NP > PP > NN > PN).

States with small economies which cannot have a significant impact on the provision of the public good of an open regime would have the latent preference function when interacting with other states in the world economy (NP > NN > PP > PN). Such states would benefit from an open world economy, if someone else provides it, but their individual benefits are so small relative to either their individual costs of participating in providing the good, or the total costs of the public good, that they are not willing to participate even in joint provision of the good.

This analysis of the preferences of the hegemon, large industrialized economies, and small economies now permits the development of expected behaviors when these different actors interact in the international economy.

Variable sum, 2x2 games have often been used to model the problems of creating and maintaining a liberal world economy. Much of the literature has focused on the prisoner's dilemma as a model of public goods problems. The current analysis implies that the prisoner's dilemma is in fact a good model when no hegemon is present. That is, if no highly industrialized economy rises to international leadership, then the strategic economic interactions between industrialized economies will be based on the interactions of two intermediate actors. Such a game will be a prisoner's dilemma and the dominant strategies will be for each actor not to provide the public good. Kindleberger believed that this was the situation during the interwar years and was a primary cause of the great depression.

> The world economic system was unstable unless some country stabilized it, as Britain had done in the nineteenth century and up to 1913. In 1929, the British couldn't and the United States wouldn't. When every country turned to protect its national private interest, the world public interest went down the drain, and with it the private interests of all. (Kindleberger 1973, 292)

In the presence of a hegemon, the public good of an open world economy will be provided. In its interactions with other industrialized countries, the hegemon pursues its privileged preference function while the other countries pursue their intermediate preferences and the resulting interaction would conform to game 2 above. Rosecrance and Taw (1990, 186) characterized this game as stag hunt versus prisoner's dilemma. The outcome of this game will be that the hegemon provides the good while the other industrialized country free-rides. Many authors have noted this behavior in the interaction between the United States and other industrialized actors during the 1950s. "America pushed hard for the elimination of quotas and advocated tariff reductions universally, but it tolerated foot dragging by Europe and Japan. As Japanese growth soared and exports poured out, the United States accepted a

disproportionate share." (Kindleberger 1976, 32; see also Krasner 1982, 34-35; and Keohane 1982)

In its interaction with the smaller economies, the hegemon will provide the public good with little expectation of participation on the part of the latent actor. Olson's remedy for this situation is embodied in his by-product theory whereby the latent actor can be induced to participate in the provision of the public good through the offer of a side-payment or selective incentive. While there may be evidence of this in the international economy, it will not be addressed in the current analysis.

A Methodology for Testing Interactive Hypotheses

The strategic outcomes that are expected in the interactions of the three preference functions provide a means for testing the behavior of the hegemonic and non-hegemonic actors during the period from 1948 to 1978. Many authors believe that the hegemonic status of the US declined over this period of time - although there is significant disagreement as to when exactly this occurred. If this is true, then it should be possible to observe the US preference change from a privileged preference to an intermediate preference as it is revealed in its interactive behavior over this period. Precisely when this change occurred is not clear. For the purpose of this analysis 1960 will be used as a cutoff date. Krasner (1975, 337-338) provides some support for this in his initial work on hegemonic stability theory. He found that US concentration of potential economic power was associated with indicators of an open trading regime from 1945 to 1960. After that time, the relative size and level of development of the US economy declined. (Krasner 1975, 340)

Revealing the interactive preferences of the United States requires a slightly different approach to the games than previously stated. International interactions are seldom played out as simultaneous games. These interactions occur as a fluid stream of action and response. One actor will act (one or more times) the other actor will respond (one or more times) and the first actor may respond to the response. Actions and reactions occur in flurries (sets) of events where the two actors interact until some equilibrium, stalemate, or resolution is achieved. These sets have been termed "decision processes" because each one represents a complete set of decisions by the two actors from the initiation of interaction to the temporary equilibrium in the interaction. (Marlin-Bennett and Roberts 1993) The equilibrium may be temporary because new conditions or new information can begin the process again. Decision processes, then, are separate sets of decisions played out from beginning to end. Using the decision process as a unit of analysis is conceptually more pleasing than the typical method of aggregating events data by some arbitrary time period such as month, quarter, or year (see for instance Goldstein and Freeman 1990). Arbitrary aggregation tends to group actions together which are not contextually linked and it separates actions that may be responses to an actions in the previous period. Such aggregations do not allow investigation of the strategic nature of interaction. That is, they do not permit the analyst to investigate what was done in response to a prior action. As Zeev Maoz (1990, 8) pointed out, "the study of international processes as event aggregation tends to ignore or downgrade the interdependent and continuous nature of world politics."

The problem then is to find a way to group events into decision processes. The events themselves are taken from the Conflict and Peace

DataBank (COPDAB) complied by Ed Azar.[5] COPDAB contains 431,280 international events dated from 1948 through 1978. Ostensibly, COPDAB is comprehensive. That is, in theory it contains every interstate event that occurred during that period, although it is clear that COPDAB's coverage falls short of this.

Decision processes can be identified in this extensive stream of events data if two assumptions are made. The first assumption is derived from rational choice theory. In a dyadic interaction, one of the two actors will perform an action if the expected utility of the action exceeds the costs. This process continues between the two actors until neither can unilaterally improve its utility within the constraints of costs. Once such a point has been reached, the process has ended and the dyad is in equilibrium. It may be an uneasy equilibrium that results from a standoff or from mutual satisfaction. The equilibrium continues and no actions occur between the actors in the dyad until one of the following conditions is met: (a) new information or technology changes the expected utility of action by one of the actors, (b) new information or technology changes the expected costs of action by one of the actors, or (c) an exogenous disturbance occurs in the interaction - perhaps a new international crisis arises. If one of the conditions is met, a new decision process is begun which is played out to its equilibrium. This first assumption is similar to the assumptions that begin Gilpin's chapter on stability and change: "An international system is stable (i.e., in a state of equilibrium) if no state believes it profitable to attempt to change the system . . . A state will attempt to change the international system if the expected benefits exceed the expected costs (i.e., if there is an expected net gain)." (Gilpin 1981, 50)

The second assumption necessary to identify decision processes is that

each decision process is an independent Poisson process. If this assumption is valid, the interevent time within the process is exponentially distributed. A counting process is Poisson if the following conditions hold:

A) Non-Simultaneity - Two events cannot occur in the same instant of time.

B) Non-Instantaneous Events - No event can occur when t=0. [P(N:t)=0]

C) Independence - The number of events occurring during any time period (t) is independent of the number of events which occurred in any previous time period (s). When this assumption is violated, the distribution is said to suffer from contagion. Contagion exists if $\alpha_t = f(\alpha_s)$ where α is the average number of events per period.[6]

D) Homogeneity - The rate of occurrence of events (α) is constant across all time periods.

If the two assumptions hold, then it is relatively easy to decompose a stream of events into separate processes using a computer algorithm. Figure 2 represents the resulting identification of processes.

The algorithm sorts the events for a dyad and computes the interevent times. A running average of interevent times is computed starting with the first event in a dyad. Each new event is then tested to see if its interevent time is likely to have been generated by a Poisson process that is defined by the running average of the previous interevent times. If the interevent time is unlikely to have been generated by the previous Poisson process, the algorithm identifies that point as the end of the previous process, resets the running average, defines the beginning of the next process, and begins checking events anew. To determine whether the current event belongs in the next process and to prevent a long interevent time from erroneously creating a process with very long interevent times, the algorithm is run in reverse chronological order as well. This methodology has been used to decompose the 431,280 events in the COPDAB dataset into 92,256 decision processes.

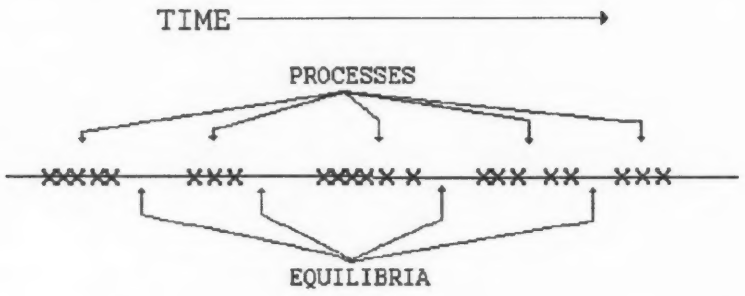

Figure 2: Graphic representation of the decomposition of events into dyads.

Each of these processes can be treated as a unit of analysis with attributes. For instance, it is possible to select out the economic processes in which the United States was either the target or the actor (or both) and analyze the types of actions taken, the issues addressed in the actions, and the level of conflict or cooperation of each event in the process. It is also possible to record the proportion of times per process that the US made a cooperative move in response to a conflictive move by another country, or - in language typically applied to strategic studies of cooperation in the international system - the proportion of times the US cooperated in response to defection by another country. In this way it is possible to document the strategic behavior of the US throughout the period from 1948-1978 to determine if it behaved according to the privileged preferences of a hegemon prior to

1960 and if it behaved according to the intermediate preferences of a non-hegemonic industrialized actor after 1960.

Hypotheses and Results

Returning to the discussion of expected behaviors in the interactions between privileged and either intermediate or latent actors, two testable hypotheses can now be derived.

H_1: In its economic interactions with large industrialized (intermediate preference), states the United States was more likely to cooperate in response to a defection prior to 1960 than after 1960.

H_2: In its economic interactions with smaller and developing (latent preference) states, the United States was more likely to cooperate in response to defection prior to 1960 than after 1960.

The concepts of cooperate and defect were operationalized in this analysis using the COPDAB conflict scale. This scale is coded as a score from 1 to 15 where 1 is the most cooperative value and represents voluntary union or forming one nation with a legally binding government, and 15 is the most conflictive value representing extensive war acts, dislocations, and high strategic costs. (Azar 1982 27-29) For this analysis, the scale was dichotomized so that scores of 1 through 8 were coded as cooperation and scores of 9 through 15 were coded as defection. The countries of the world were divided into three groups: intermediate group, latent group, and countries with a communist economy. The later group was excluded from the analysis. The intermediate group consisted of the industrialized economies (Australia, Japan, Austria, Sweden, Great Britain, Netherlands, New Zealand, Canada, Italy, Switzerland, West Germany, Greece, France, Norway, Spain, and Finland). All other non-communist countries were assigned to the latent group.

The following four dependent variables were tested, only one of which (CD) is key to the hypotheses:

CC Proportion of times in a process that the US cooperated in response to cooperation by the other actor.

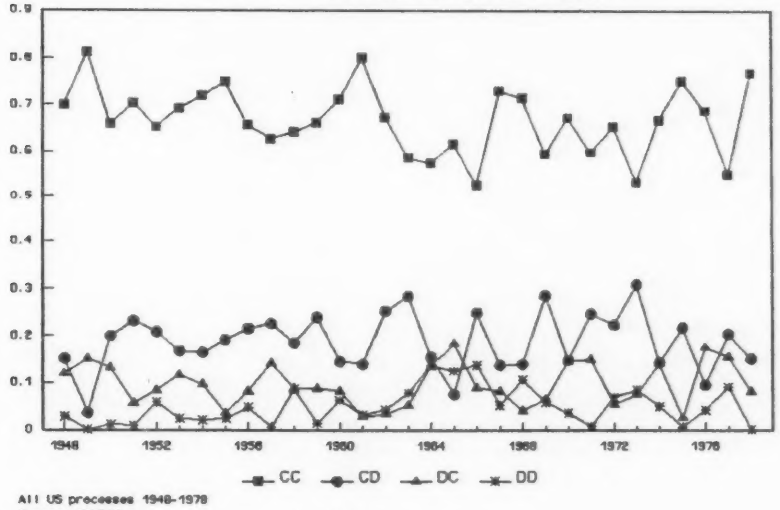
CD Proportion of times in a process that the US cooperated in response to defection by the other actor.

CD Proportion of times in a process that the US defected in response to cooperation by the other actor.

DD Proportion of times in a process that the US defected in response to defection by the other actor.

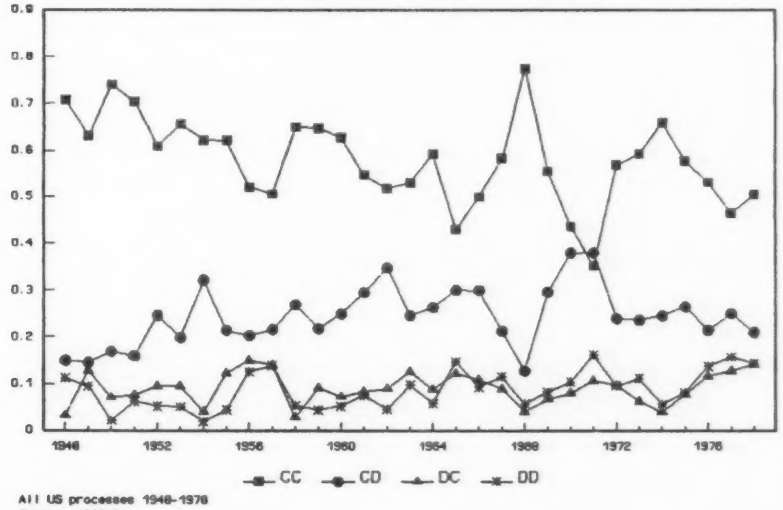
Figures 3 and 4 provide initial views of the data for all the US process over the period from 1948-1978. Each figure graphs the average for the four variables for each year. It is difficult to see any real difference in the strategic behavior of the US before and after 1960. Strategic behavior does seem to be slightly less "well-behaved" on the intermediate preference graph after 1960 in that it seems to vary more from year-to-year. Without conducting extensive time-series analysis, no conclusive analyses of these graphs can be offered.

Figure 3. Average Proportion of each Strategy Per Year for US vs. Intermediate Preference Actors



All US processes 1948-1978
Source: COPDAB

Figure 4. Average Proportion of each Strategy Per Year for US vs. Latent Preference Actors



All US processes 1948-1978
Source: COPDAB

It is possible, however, to analyze the average proportion per process of each strategy before and after 1960. Difference of means tests (t-tests) were conducted on processes which contained only economic events. Separate tests were performed for US interactions with intermediate actors and for US interactions with latent actors. The dependent variable which defined the two samples for the tests was a binary variable that identified the period of US hegemony with a value of 1 if the process started before 1960 and a value of 0 if the process started after 1960.

In economic processes with the industrialized countries prior to 1960, the US chose to cooperate in response to defection in an average of 33% of the events per process. After 1960, the US chose to cooperate in response to defection in only 4% of the events per process. This difference is significant at the .05 level for a one-tail t-test with unequal variances. Since there is some disagreement when US hegemony began to wane, the t-tests were recalculated for cutoff dates of 1961, 1963, 1967 and 1970. The results are displayed in table 3. There is a significant difference in the US use of the cooperate-defect strategy before and after the cutoff dates of 1960, 1961, and 1964. There are no significant differences for the cutoff dates of 1967 or 1970. These results support the hypotheses that the US changed its interactive preference from those of a privileged actor to those of an intermediate actor sometime around 1960.

Cutoff Date	Average CD Proportion Before Cutoff	After Cutoff	t-test Value	Sample Variances	Degrees of Freedom	One-Tail Critical t value (α = .05)
1960	.333	.044	-1.9837	Unequal	12.0	-1.782*
1961	.307	.045	-1.9081	Unequal	13.6	-1.771*
1964	.267	.048	-1.7648	Unequal	16.7	-1.746*
1968	.235	.052	-1.6218	Unequal	20.5	-1.725
1970	.178	.092	-0.9289	Equal	52.0	-1.684

* Indicates a result that is significant at the .05 level.

Table 3. Difference of means tests for average CD proportion before and after various hegemony cutoff dates for US economic interactions with "intermediate preference" states.

There is little evidence in the current analysis that US interactive behavior toward the smaller latent actors was different before and after 1960. Prior to 1960, the average proportion of CD plays by the United States was .167. After 1960 that average rose slightly to .186, although there was no significant difference between these two averages. There are no significant differences between the proportion of US cooperate-defect strategies before and after any of the hegemonic cutoff dates that were tested. This could imply that there was no shift in US preferences as predicted by hegemonic stability theory or it could imply that there was a different dynamic in the relationships with the smaller states. The t-test results for the US economic interactions with latent preference actors are shown in table 4.

Cutoff Date	Average CD Proportion Before Cutoff	After Cutoff	t-test Value	Sample Variances	Degrees of Freedom	One-Tail Critical t value (α = .05)
1960	.167	.186	+0.2752	Equal	123.0	-1.658
1961	.142	.207	+0.9524	Equal	123.6	-1.658
1964	.190	.164	-0.3938	Equal	123.7	-1.658
1968	.187	.163	-0.3398	Equal	123.5	-1.671
1970	.185	.156	-0.3639	Equal	113.0	-1.684

There are no results that are significant at the .05 level.

Table 4. **Difference of means tests for average CD proportion before and after various hegemony cutoff dates for US economic interactions with "latent preference" states.**

Conclusions

Leaders lead. Previous analyses of hegemonic stability have focused only on the expected correlation between the economic power of a possible hegemon and the degree of openness that the hegemon is presumed to create through its policies. Kindleberger (1973) pointed out the fallacy of the correlational approach to hegemonic stability in his initial work on hegemonic stability when he characterized the US as being able but unwilling to provide international economic leadership during the interwar years. If Kindleberger was correct, a purely correlational analysis of this period would have refuted the hegemonic stability thesis.

The analysis presented here tries to go beyond purely correlational study. If hegemonic stability is correctly framed as a problem of providing a public good, then a leader should engage in certain specific interactive behaviors. These behaviors are not foreign to the hegemonic stability literature. Many authors have noted that a leader trying to create an open

economic order must forego short term benefits in order to enjoy the greater long term utility of an open world market. Clearly, size and power of an economy are not unrelated to these actions as Krasner (1982, 37) pointed out that, "Only an extremely powerful state will pursue such policies." Yet economic power and size are only necessary conditions for being a hegemon, they are not sufficient.

By examining the behavior of a supposed hegemon as it interacts with other members of the world economy, it is possible to impute its preferences and make inferences regarding its intentionality. A large powerful state is not a hegemon unless it performs the actions of a hegemon. The analysis provided here implies that the United States did act as a hegemon in its economic dealings with other industrialized countries until sometime in the early 1960's. This period of "privileged preference" corresponds with the increasing economic openness and prosperity in the world economy that has been documented by other authors. Sometime in the early 1960's the United States seems to have changed its preferences away from those of a privileged actor to those of an intermediate actor. This also corresponds with the declining power and size of the US economy that has been documented elsewhere.

If the US interactive preferences changed to those of an intermediate actor during the early 1960's, then international economic relations between the industrialized states (including the US) would be characterized by a prisoner's dilemma. This is certainly supported by much of the literature on economic relations. It also offers an answer to a problem that has faced many of the correlational analysts of hegemonic stability. As Krasner (1975) pointed out, the relationship between US economic power and the openness of the world market falls off after 1960. While US economic power declined, the

openness of the market remained high or increased until the mid 1970's. This would seem to refute hegemonic stability. Correlational studies have addressed this problem by asserting that there is a lag effect between the decline of the economic power of the hegemon and the indicators of openness in the world market. If, however, it is recognized that the US shifted its interactive preferences at the some point of during the decline of its economic power, then the problem can be framed as a repeated prisoner's dilemma game. A great deal of literature has shown recently that tit-for-tat strategies in repeated prisoner's dilemma may generate the economic cooperation that leads to the public good of the open market (see most notably Axelrod 1980, 1981, 1984; Keohane 1984; and Axelrod and Keohane 1985).

The current analysis can shed some small amount of light on this question. If the US and other industrialized countries pursued extended tit-for-tat plays after US hegemony ended, then the US interactive behavior after 1960 should show increased cooperation in response to cooperation and defection in response to defection. The data analyzed in this study show a slight increase in these strategic moves by the US after 1960. The proportion of CC moves increased from .50 to .59, however, this was not a statistically significant increase (t=.5615 with 42 degrees of freedom). There was no change in the proportion of DD moves.

If cooperation evolved in prisoner's dilemma interactions between industrialized countries after 1960, then a modification of the hegemonic stability thesis may be in order. The presence of a hegemon may increase the degree of openness in the liberal world economy due to the interactive behaviors of the hegemon. If the hegemon shifts away from these behaviors, it still may be possible to generate the cooperation that is needed to provide

the public good of an open economy through the dynamic interactions of intermediate preferences in repeated prisoner's dilemmas. If this is the case, then hegemony may be a sufficient but not necessary condition for openness in the liberal world order.

NOTES

1. See for example Krasner (1975), Webb and Krasner (1989), and Mansfield (1992).

2. The "solution" algorithm that is followed for each of these games is taken from the work of Rapoport and Guyer's (1966) concept of the "natural outcome." The number in square brackets shown for each game is the game's reference number in Rapoport and Guyer's taxonomy of 2x2 variable sum games.

3. Olson (1965) discusses means that may be available to induce the latent player to participate in provision of the good. These means include selective incentive, or a side payment that is offered to change the utility calculation of the latent player. All of these means must be carried out outside the context of the rules of the 2x2 game.

4. Events databases such as COPDAB are created by reviewing news sources from around the world and coding all situations where one actor does something directed toward another actor, referred to as the target. In theory, such databases are comprehensive views of what occurs in international relations. For discussions of problems with coverage and composition in events databases see Howell 1983, Vincent 1983, and Schrodt 1988.

5. The problem of contagion is perhaps the most threat to the validity of this methodology. As this paper is being written, the methodology is being tested for evidence of contagion. Even if contagion exists, the effects of contagion are both estimable and correctable.

   Coleman (1964, 299-301) proposed a contagion model when the contagion is of the form:

   $\tau_{10} = \alpha$
   $\tau_{12} = \alpha + \beta$
   $\tau_{23} = \alpha + 2\beta$
   $\tau_{i,i=1} = \alpha + i\beta$

   where τ = the parameter of the Poisson and can be thought of as a Markov transition probability. Thus contagion is in a linear form

Coleman derived a contagious Poisson distribution from this assumption:

$$P(x;t) = \frac{\alpha(\alpha+\beta)(\alpha+2\beta)\ldots(\alpha+(x-1)\beta)e^{-\alpha t}(1-e^{-\beta t})^x}{\beta^x x!} \tag{1}$$

Coleman's form can be simplified using the product form to equation (2)

$$P(x;t) = \frac{\prod_{i=0}^{x-1}(\alpha+i\beta)e^{-\alpha t}(1-e^{-\beta t})^x}{\beta^x x!} \tag{2}$$

Coleman derived estimators of the parameters α and β:

$$\beta = \ln(s^2/\bar{x}) \tag{3}$$

$$\alpha = (\bar{x})^2\beta/(s^2-\bar{x}) \tag{4}$$

Again, if the number of events per period are distributed by this contagious Poisson, then a distribution of the interevent times can be derived as a modified exponential distribution.

PROOF:

Let T = the interval between two events.

(T>t) implies that no event has occurred in the interval t.

Thus, by equation (2),

$$P(T<t) \rightarrow P(x=0;t) = \frac{(\prod_{i=0}^{-1}(\alpha+i\beta))e^{-\alpha t}(1-e^{-\beta t})^0}{\beta^0 0!} = \alpha(\alpha-\beta)e^{-\alpha t} \tag{5}$$

and, thus $F(T) = P(t \leq T) = 1 - \alpha(\alpha-\beta)e^{-\alpha t}$ which is an exponential distribution, QED.

Since α and β are both estimable, the process algorithm can be calculated.

Introduction

Only recently have political scientists seriously acknowledged the role that political advertising may play in specific campaigns. The 1992 presidential campaign resulted in Independent Ross Perot being named "Adman of the Year" by *Advertising Age*, a major trade publication. In praising Perot, the publication stated, "His masterful exploitation of free TV time and his revolutionary 30-minute infomercials--interspersed with more conventional 30- and 60-second spots-- were the year's communications phenomena, helping the feisty entrepreneur win 19% of the popular vote for president" (Colford 1993).

Following the Independent Perot's talk show strategy, the winning candidacy of former Arkansas Governor Bill Clinton to toot its own horn on *The Arsenio Hall Show*, assisted Clinton's comeback recovery from the near-fatal Jennifer Flowers scandal. Clinton's appearance on MTV, a primary rock-video cable station that reaches the fragmented youth and young adult market, helped to produce the most sizable presidential youth vote not seen since the days of John Kennedy. Garnering precious advertising dollars, the Clinton campaign focused tightly on specialized media time buys predominately in twenty states, while ignoring the previous conventional wisdom of spending large sums of money buying the three major networks nationally.

The incumbent George Bush's acclaimed 1988 strategical brilliance evaporated into a 1992 disaster. Without a clearly defined and communicated message strategy about solving the country's economic woes, coupled with a waste of dollars on time-buying nationally, the Bush negative attack on Clinton's trustworthiness became the GOP's own nemesis -- "It's the Economy, Stupid." Unlike Dukakis who rebutted and counterattacked during lower rated national network news until the final weeks of the 1988 campaign, the 1992 Clinton campaign aggressively attacked and counterattacked in all key markets nearly gross rating point per gross rating point in an attempt to defuse each Bush campaign salvo upon launch.

Both the Perot and Clinton campaigns fly in the face of "orderly" politics. The sophistication of their 1992 integrated political marketing communication and time-buying strategies indicate that "it isn't politics as usual anymore." Although political scientists may have been late comers to acknowledge the power of political advertising, learning the "last secrets" of political consultants involve gaining greater insight into the strategic placement of airtime. Hagstrom (1992) wrote,"In a campaign's time-buying strategy are the keys to how much it is spending, who it is trying to reach, and finally the rarely asked question of how well the campaign is spending its money" (21). "The next generation of reporters and political scientists needs to be one part traditionalist, one part pollster, and one part film critic." Hagstrom's quote should not be interpreted as tenuous. Hagstrom based his observation on six years of reporting on political consulting for *National Journal* and countless interviews with the elite cadre of the nation's transcendental political powers.

The current works of Roberts (1991, 1992) have quantified the agenda-setting function of political advertising and its impact on voter choice in the 1990 Texas gubernatorial campaign. The study's candidates' issue agendas were constructed by weighting the actual frequency of airing of the candidates' political commercials by issue content. Roberts and McCombs' (1993) findings demonstrate the intermedia agenda-setting influence of political advertising on the issue agenda of both newspaper and broadcast coverage of the campaign.

Hagstrom wrote, "...polling and television commercials have come to dominate American politics, but without receiving the scrutiny they need and deserve." Jamieson (1992) wrote, "In both its "strategic" and its "substantive" reporting, television news in 1988 allowed itself to be shaped by polls and manipulated by the more artful consultants" (10). The strategic application of marketing concepts to the

political process by political consultants imbued over time. The evolution towards political marketing can be traced in a growing body of research (Kelly 1956, White 1961, Glick 1967, McGinniss 1969, Nimmo 1970, Agranoff 1976, Kotler 1982, Mauser 1983, Newman and Sheth 1983, 1985, 1987, and O'Shaughnessy 1990). For a concise evolution of political advertising research over this period, see Faber (1992).

Hagstrom acknowledged that polling and filmmaking are the "heart and soul of campaign consulting." However, he recognized and buoyed up the most under-researched "last secrets" in gaining an all-inclusive understanding of political marketing and consulting --- the strategic media planning process and media placement buys of political commercials. He wrote, " 'Political files' of advertising sales, kept in the offices of every radio and television station in the country, are an underutilized gold mine of information for reporters and scholars."

The purpose of this paper is to introduce political scholars to the strategic media planning process and time buying strategies utilized by political consultants. First, the paper will provide an overview of the media planning process. Secondly, a discussion of how political consultants have adapted this process to political campaigns will be presented. Third, an exploratory comparison of a local television media buy placed on behalf of the Clinton, Bush, and Perot campaigns from a "public file" of time buys placed in the Columbus, Ohio, market area will be examined. Followed by a discussion of the 1992 postelection recall of presidential campaign advertising and direction of candidate influence by respondents from the local market area. Finally, the paper concludes with a discussion of the study's limitations and sets forth areas for future research opportunities using campaign media placement buys.

Defining Strategic Media Planning

In presenting a definition of strategic media planning, it is essential first to examine the individual words that compose the term. Many individual definitions of strategic media planning have been offered. The author will present a definition that, in her opinion, closely adapts to the political marketing environment in terms of both conciseness and clarity. Bogart (1990) defined strategy as "the art of deploying available resources to attain objectives in the face of active opposition." Media encompasses a wide array of traditionally considered forms such as newspapers, television, radio, direct response (direct mail or telemarketing), outdoor and transit, and cable. The new media include high definition television, interactive television, videocassette, pay-per-view, televised "magazines," shopping networks and video catalogs, televised yellow pages, "location" television, computer information services, computer bulletin boards, computer shopping services, messaging and electronic mail, computer conversation channels, telephone conversation lines (Stewart 1992). The list will grow continuously as other new technologies emerge in 21st Century America.

The word *planning* indicates a series of decisions. The most resonant definition of strategic media planning is that of Jugenheimer, Barban and Turk (1992) and Barban, Cristol and Kopec (1993) which is stated as:

> the process of designing a course of action that shows how advertising time and space will be used to contribute to the achievement of advertising and marketing objectives (2).

Barban et al. state that the critical key to developing an understanding of media planning is to be able to distinguish between the three "most misunderstood words in managerial planning vocabulary -- objective, strategy, and tactics.

The authors define the word objective as simply "a statement of the task one wishes to accomplish." Former President George Bush, then Arkansas Governor, Bill Clinton, and Independent candidate Ross Perot all set out with the same objective -- to be elected (reelected) the President of the United States.

A strategy is defined as "the means prescribed for attaining the objective." In order to achieve the objective of becoming the President of the United States, a successful strategy of obtaining 270 electoral votes is required. Barban et al. have determined at least five types of strategies. These include, but are not limited to, properly defining the target market, the media mix, the continuity pattern, and the development of contingency and alternative strategies. These five major types of strategies will be described in greater detail in a later section of the paper.

Tactics are defined as "specific, detailed activities required to implement the strategy." Tactics are comprised of vehicles, units, estimating and costing functions, scheduling, ordering, and bookkeeping. Vehicles are composed of specific program selections, such as *Good Morning America*, *60 Minutes*, and *Murphy Brown*. A unit is defined as a single commercial, such as a :30 polispot (commercial) for Bush, a :60 polispot for Clinton, and a single 30-minute infomerical for Perot. In order to estimate the cost schedule for a specific candidate, several standard mathematical formulas are calculated to compare the cost of one vehicle versus another vehicle. Today special computer programs have condensed the prior endless hours of hand calculations to a few seconds. Still with the numerous technological advances in media buying, the placement of airtime is more art than science.

As shown in Figure 1, Jugenheimer, Barban and Turk (1992) and Barban, Cristol and Kopec (1993) have modeled the media decision-making process. The model is divided into five central components with constraints and uncontrollable influences having the potential to impact and interact any of the five major components. As in any marketing situation, the consumer, the product, the market analysis, and competitive situation must all be taken into consideration. Objectives appear in a hierarchical manner. Schultz (1990) chooses to use the term "cascading" to describe hierarchical requirement to ensure that the broadest objectives will be carried through and permeate to the more detailed tactical decisions.

The strategy component of the media decision-making model involves a precise definition of the target market. Target markets are usually defined in at least one, if not all three approaches -- demographically, sociopsychologically, and through identifying various levels of product usage. When segmented by product usage, this is usually relative to the competition. Four categories best describe usage. The first category are those who use your product exclusively (straight Republican or straight Democratic voters). Next are those who use your product most of the time, but will use other brands. For example, those Republicans who voted for Carter in 1976 and Clinton in 1992. Research conducted during the situational analysis may require that primary, secondary or tertiary markets be defined. The third usage level would be made up of those who are secondary users. While they may use your product, they use other brands more often. These are voters who are unpredictable true independents who "buy on price." Regardless of party, where will I get "the best deal" (no taxes, help with child care, etc.). Or approached from another perspective, which of the candidates is the lesser of the two (or three) evils. The professional expertise of defining the target market lays in the integration and interaction between brand usage (the level of partisanship voting) and product usage (the candidate). Barban et al. wrote, "The interaction between brand usage and product usage levels represents an exciting dimension in approaching target market definition and will give the media planner a deeper understanding of the advertising task relative to the competition." (41).

The most frequently used secondary data information sources that integrate consumer media usage and product usage are Simmons Market Research Bureau (SMRB) and Media Research Institute (MRI). Both sources use a similar format of data layout. While specially tailored data can be custom ordered, the majority of full-time media planners subscribe to one of these sources. The other major source of secondary information essential for media planners are either Nielsen or Arbitron television ratings. These competitive sources provide data on rating points and audience composition information for specific programs and times of the day, both nationally and on a market-by-market basis.

Strategizing also includes the determination of the proper *media mix* for the campaign. Media mix can be defined as the balance between media types (television, newspaper, radio, etc.) that will be used over a given period of time. The media mix refers to the use of two or more media. For example, a media planner may choose to spend 75% of the advertising budget on television, 15% on outdoor, and 10% on radio. Another term closely associated with the media mix is *weighting*. This term refers to the relative emphasis that each target market (primary, secondary, or tertiary), geographic area (The South, The Northeast), time segment (early morning, daytime, prime time), and media type (television, radio, etc.) is strategically given during a specific campaign.

Continuity refers to the pattern of advertising placement used throughout an advertising scheduling period. For most products and services, continuity is considered in terms of a twelve-month period. A continuity pattern is selected from three basic scheduling strategies -- continuous, flighting, and pulsing. (See Figure 2.) A *continuous schedule* spends the same percent of the total budget each month. A *flighting schedule* spends a percentage of the total in specific months, while leaving other months with no paid media efforts. Finally, a pulsing schedule can be considered a hybrid of continuous and flighting. A *pulsing strategy* spends advertising dollars continuously throughout the year, but it selects specific months for increased media emphasis. Political advertising does not appear year round; how media planners have adapted continuity strategies for shortened political campaigns will be discussed in a later section.

As all well planned campaign strategies, contingency and alternative strategies must be considered initially, not as afterthoughts. Many political advertisements are made and never aired in order to have them air ready as alternative strategies. The strategic reasons for overproduction are many. First, the nature of political campaigns are fast-paced. Prior to videotape technology, a filmed spot would take several days to get on the air. However, in 1992 spots were produced and on air in twenty-four hours. Issues can emerge and die instanteously. New traffic instructions can be faxed to stations that identify which new commercial(s) are to air in existing scheduled times. Overnight shipping services handle rushing the new commercials to specific markets. A favorite strategy that opponents use is to force each other to spend crucial advertising dollars needlessly. An advertising buy may be made in a "must win" state by one opponent, hopefully, forcing additional dollars to be placed in the market by the other candidate. A very realistic reason for alternative planning is when fundraising efforts are less than expected. In this instance, media planners have to pare back advertising scheduling since all political buys must be paid for in advance. In 1988, the Bush campaign did not need to spend advertising dollars on a commercial to inform voters about Dukakis' vote on the Pledge of Allegiance issue due to the news media's heavy coverage of the issue. However, the spot was made and ready to air if needed.

As the model of media decision-making process indicates, media planning is a dynamic process. The campaign's impact on the audience and advertising effectiveness are measurable. Tracking polls and focus groups are two of the most

popular measurement tools used to determine the effectiveness of the message during political campaign. After the message has been determined, no less important is the job of placing the message before the correct audience as efficiently as possible. The shortened length of political campaigns often requires continuous feedback (when it can be afforded) to assist in predicting voter choice as closely as possible.

The Currencies of Media Buying

As evidenced from the preceding discussion, strategic media planning has its own unique terminology. Likewise, the purchasing of media airtime has unique formulas and mathematical calculations for comparing the efficiency of buying one program versus another, or one time period versus another. Definitions necessary for the understanding of vehicle comparisons and calculations are the following : rating point, share of audience, gross rating points, reach, frequency, cost per thousand, and cost per point.

A *rating point* can be defined as the percentage of individuals (or households) exposed to a particular television program at a specific time. Rating is the most important broadcast term in that it represents the relative popularity of the program. A rating is a percentage, but the percentage sign is not shown. Ratings also serve as a yardstick about how many potential customers, users, voters, etc. can be reached if selecting a particular program. Broadcasters also base advertising costs on the size of a specific program's audience. Therefore, the higher a program's rating, the higher its cost. However, a good media planner knows that it is possible that a lower rated program may deliver a more narrowly defined audience more efficiently than a more expensive, higher rated program.

On a national basis, one rating point typically represents 931,000 television households. A rating point is said to represent approximately one percent of the coverage base. When thinking of the coverage base on a local or individual market-by-market basis, ratings are developed for a specific geographic coverage areas (Columbus, OH, San Diego, CA, Chicago, ILL). The most frequently used terms to describe geographic rating areas are Area of Dominant Influence (ADI) used by Arbitron and Designated Market Area (DMA) used by Nielsen. It stands to reason that the cost per rating point for airtime will be much higher in major metropolitan markets, like Dallas or Houston, than in secondary markets such as Abilene or Midland, Texas.

Hall (1991) defines *Share* or *Share of Audience* as "the audience of a specific program as a percentage relative to all of the households (persons) watching at the time of the program's broadcast." For example, three local newscasts may air at 6 o'clock. A percentage of viewers at 6 watch channel A's newscast versus B or C. There also may be persons watching a rerun of a movie or *Jeopardy* on television at 6 on other stations.

Reach, as defined by Sissors and Bumba (1992), "is a measurement of audience accumulation." Reach tells media planners how many *different persons* or television *households* are in a specific program's audience over a period of time. For example, over a four week period, how many different persons tuned in to watch *Northern Exposure* in weeks 2, 3, and 4 than watched during week 1. Reach is usually measured in quarter-hour intervals.

Continuing with the example of *Northern Exposure*, there will be some viewers who will watch four out of four shows, three out of four shows. The media concept of *frequency* is the number of times an average audience person or household is exposed to the advertising at least once in a specific period of time. In other words, frequency

is the number of times the same persons watch *Northern Exposure* in a 4-week period.

In order for media planners to compare one program with another, mathematical formulas are calculated to compare the costs of placing a commercial in one time slot versus another. To calculate the total sum of rating points (*Gross Rating Points*, GRPs) for a particular product or candidate's schedule, media planners use the following formula:

GRPs = rating for each spot x the number of times each spot will air.

As with rating points, gross rating points also are percentages, but the percentage signs are not shown. Gross Impressions are similar to gross rating points, but they are expressed in terms of absolute numbers of persons or households. *Gross Impressions* can be defined as the sum of audiences of all vehicles used in a media buy. Scissors and Bumba (1992) wrote that, "This number represents the message weight of a media plan. The number is sometimes called the 'tonnage' of the plan, because it is so large." The formula media planners use for calculating gross impressions is:

GIs = GRPs x number of television households or persons in thousands.

Both GRPs and GIs indicate the gross delivery without regard for multiple exposures of the same persons or households.

When determining the cost per thousand (CPM) of a media schedule for reaching each 1,000 of a specified audience (or households), the following formula is calculated:

CPM = Cost / (Audience/1000).

Cost per thousand is a common denominator for media comparisons. Hall (1991) wrote:

> The more discriminating the measurement of audience, the more discriminating will be the CPM . . . Remember that CPM, even on a weighted audience basis, simply relates cost and audience. It does not reflect the configuration of audience in terms of size or reach, frequency, or continuity. Consequently, it should seldom be used as the only criterion for media selection (p. 70).

Cost per thousand can also be used to determine the cost per rating point (CPP) in a particular media schedule. This formula is expressed as:

CPP = CPM x (Population/100,000).

Calculating CPPs is another method to compare the cost efficiency of media vehicles.

The final two calculations determine the tradeoffs that media planners routinely must face between a schedule reaching different persons and the frequency required of reaching the same persons a number of times in order to "teach" the message. Bogart (1990) wrote, "Within a given budget, one of these three dimensions (reach, frequency, and the size) [of the message unit] must always be sacrificed in order to improve the others." He also wrote, "The larger or longer the message, the more likely that the reader or viewer will be stopped in his tracks long enough to get the point." However, if a media planner considers extending the length of a commercial, for example, to a 30-minute "informercial", normally either reach or frequency is dramatically reduced due to budget constraints.

Reach and frequency occur at the same time, but at different rates and in an inverse relationship. Sissors and Bumba (1992) wrote the following regarding reach and frequency:

> Up to a certain point, it is relatively easy to build reach. By selecting television programs of a different nature in which to place commercials, it is possible to reach different kinds of people. But there is a point of diminishing returns, where each attempt to build more reach by selecting more and different kinds of programs results in reaching the same persons over and over again, with an increase in frequency rather than in reach . . . The point of diminishing returns . . . occurs at about 70 percent and varies somewhat because some target audiences are easier or more difficult to reach (p. 104).

The mathematical formula for calculating *reach* is as follows:

$$\text{Reach} = \text{GPRs} / \text{Frequency}.$$

Gross rating points, reach and frequency are all mathematically related. Given any two factors, the third can easily be calculated. The formula for calculating the *average frequency* of a schedule is as follows:

$$\text{Frequency} = \text{GPRs} / \text{Reach}.$$

Frequency distributions also are calculated by computer programs to determine the exposure distributions for a given schedule. For many years advertising practitioners have been trying to answer important questions that move beyond simple numerical calculations of reach and frequency. Media planning researchers have come up with the terms such as *effective reach* and *effective frequency* which attempt to address questions such as "How much advertising is enough?" "How many times must an advertising message be repeated for it to effectively communicate?" Currently most media planners accept a minimum frequency of at least three repeated exposures for a message to be learned. Other researchers have given a range of three to eight exposures. Considering the cluttered and competitive nature of campaign advertising for multiple candidates during a short timeframe, an effective frequency of 3 + may not be realistic. Hall (1991) wrote, "If conditions dictate, such as low awareness, tough competition, and a complex message, then a 4 + or higher effective frequency goal may be selected."

How Political Consultants Have Adapted Media Planning

Hagstrom (1992) wrote, "The process of time buying itself demonstrates how much politics has adapted to a changing world of communications." He pointed out that politicians and their consultants must now think in terms of "media markets" rather than in terms of traditional jurisdictions of states, cities, and counties. A September 17, 1992, article in *The New York Times* quoted Tad Devine, a top aide to Senator Lloyd Bentsen of Texas in the 1988 Vice-Presidential campaign, as saying, "Analyzing the media buy is some of the most important strategic information you can get . . . When you go in and you plunk that money down, you say, 'This is our strategy for winning the Electoral College'" (Kolbert 1992).

With seven weeks before the 1992 election day, Kolbert stated that the media campaign had entered "its cloak and dagger phase." She wrote, "Though there is no campaign tactic more public than advertising, no information is more closely guarded than what the candidates plan to put on television and where." She concluded that, "This is because at this stage of the race, every advertising dollar spent represents a clue to a campaign's deepest hopes and a potential revelation about its priorities."

Wilson (1987) presented a chronology of political television advertising that assists in tracing the technological developments to obtain better strategic information upon which to base media strategy and time buying. In 1952 the Eisenhower campaign was the first to use a rating service to assist in buying time (A.C. Nielsen). In 1976 Market Opinion Research used the perceptual mapping survey technique for the Ford campaign. In 1985 Senate and Congressional campaigns instituted comprehensive retrieval of opponents' media buys. Wilson noted that a less formal approach to collecting media had been used since the early 1970s.

Adding to the list of developments is the 1992 use of the computerized technology called "Polaris" from Broadcast Data Systems. In a January 19, 1992, *Newsday* article, Thomas J. Maier wrote:

> One new weapon aimed at monitoring TV ads -- and at figuring out an opponent's media strategy -- seems inspired by the high-tech thriller, 'The Hunt for Red October.' First used by the military to track submarines in the deep, this new technology takes 'audio fingerprints' of television commercials by breaking down its specific sounds into a digital code that can then be tracked by computer. It can follow an opponent's TV spots, showing what target audience an opponent's media team is going after (88).

Not only can "Polaris" track an opponent's media strategy, but the candidate's campaign can keep track of when their own commercials have aired. "Polaris" is only the latest innovation in the $3 billion business of selling America's political candidates.

According to Brad O'Leary, chairman of the American Political Consultants, there are approximately 6,000 companies and individuals involved in today's political industry. He includes in the figure those in graphics, computers, media strategy, polling, advertising, telephone contacts and grass-roots organizing efforts. In 1988 the total campaign spending for federal, state and local races was $2.7 billion. According to Maier (1992), consultants, media buys and other political industry expenses accounted for more than 90% of the total campaign spending in 1988. Of that total television media buys accounted for less than 10% of all political spending. However, television media buys accounted for more than 60% of the total spending in federal campaigns.

Media time-buying is one of the largest sources of income for many political consultants. Commissions of 15% are considered standard by both commercial and political consultants. However, in highly populated metropolitan markets that carry high media costs, a lower commission percentage rate may be negotiated. Hagstrom (1992) noted that most successful political consultants will not handle a campaign unless the firm is allowed to provide the time buying function as part of the contract.

By law, Federal Communication Commission regulations require broadcasters to offer either free or paid time 45 days prior to a primary election and 60 days prior to the general election.

During these times broadcasters may charge political candidates no more than the station's lowest advertising rates. Outside of the designated 45 and 60 day windows, stations may charge legally qualified candidates their standard advertising rate. For a more detailed description of campaign regulation for broadcasters, see Middleton and Chamberlin (1988).

Unlike the earlier discussed continuity patterns of media placement based on a twelve-month buying cycle for most products and services, buying patterns for the 45 and 60 day windows have been adapted by consultants. Sabato (1981) identified four buying strategies used by political consultants. The first is called the "flat buy." This buying patterns traditionally begins about three weeks out from election day. The same number of spots are placed during each week of the schedule, similar to the continuous scheduling strategy. The second strategy is referred to as the "orchestrated finish" and usually begins at least a month out and increases in intensity as election day draws near. The third strategy is called the "event schedule" and concentrates the airing of political spots around important events in the campaign. Finally, the "stop-start" form of scheduling can be compared to the commercial placement strategy of flighting. This strategy is useful to conserve budget and build name identification. Since Sabato (1981), the current trends toward political consultants beginning to air commercials earlier and negative advertising being brought out earlier in media strategies have been noted in the works of Kern (1989) and Johnson-Cartee and Copeland (1991).

As the focus of this paper now turns to the media strategies used during the 1992 presidential campaign, the reflections of Wilson (1987) are valuable remainders of why political scholars should begin to more closely scrutinize the least understood, but most profitable, role of political consultants -- that of buying airtime. Wilson wrote:

> No one can quantify precisely how much television advertising may matter in a presidential race, yet it is critical to electoral success. This strange oxymoron explains the ephemeral, art-science of political advertising. It justifies why campaigns work so hard to organize, win endorsements, woo the media and then, in apparent strategic contradiction, spend millions on television. Welcome to non-linear politics (21).

Buying Strategies of the 1992 Presidential Campaign

The 1992 presidential campaign "air war" sent more political advertising messages into the American television households than any general election campaign. The reemergence of Ross Perot with his self-financed campaign, candidate campaign committees, and national political party expenditures could easily exceed $100 million when the final price tag is placed on the 1992 presidential general election campaign. The unconventional use of those dollars is what makes the 1992 campaign of interest from a media strategy perspective. A September 23, 1992, article in *The Washington Post* should have been a "tip off" that the Democratic nominee's media buying strategy would be the most sophisticated application of targeted political marketing ever demonstrated in a presidential campaign. Kurtz (1992) wrote, "A new phrase has become the rage among Bill Clinton's campaign staff: 'Cost per persuadable voter'."

Using computer-aided calculations that took into account such factors as a state's unemployment figures, swing voters in past elections, and then President George Bush's approval rating, the Clinton campaign focused its media strategy on 20 states. The campaign did not depart from its strategy until the final two weeks of the campaign when the final outcome was more apparent.

The Clinton campaign launched its initial general campaign "air war" a week after the Republican National Convention. Germond and Witcover (1993) wrote, "The Clinton strategists' unconventional timing and targeting sent a distinct message: they were determined not only to define their candidate in their own terms before the Bush campaign did it for them, but to do so intensively in the key states that could win the election for them" (436).

The birth of the strategy to shun traditional major network national buys was decided upon due to the need to follow a two track approach. A heavy schedule of buys was required to define Clinton is positive terms in one track, while a second track of commercials hammered away at George Bush with issues previously raised by voters in opinion polls. The only feasible way to accomplish the two track approach was to make heavy, less expensive local buys. The Clinton campaign targeted more than 80% of the $35 to $37 million available advertising dollars in the 20 battleground states. Paul Tully held weekly meetings in Little Rock about how much and where to place the buys. Fifty media buyers stood by to implement the actual time purchases.

The greatest gamble of the Clinton media buying strategy was to withhold advertising dollars from states that could be won. The confidence in the polling results of Stan Greenberg held the Clinton team on the original 20 state strategy. In such an unconventional approach, Mandy Grunwald said that, "California watched seven weeks of negative ads about Bill Clinton and never heard an answer" (Germond and Witcover, p. 440). However, Clinton was adroit at using ample free media to respond to Bush's attacks.

In contrast, the Bush campaign strategy placed the majority of advertising dollars on national network buys. This strategy was at first presumed to be a "temporary" measure, while the Bush campaign tried to determine which states Bush could seriously compete in. In battle ground states such as Ohio, Michigan, and Illinois, Bush "heavied up" his national buys with local buys. However, the predominant "shotgun" approach taken by the Bush campaign was loosely targeted and produced a high degree of "waste." Waste in media planning termology is the degree to which a buy reaches those who are not defined in the target market. The hope of the Bush campaign was that the polls would start moving in his favor. This is not to say that the Bush media strategists were in error. A "shotgun" approach may have been the only viable strategy. However, in the opinion of this author, a "shotgun" approach can be taken as a desperation strategy when candidate's negatives are exceedingly high. Another case where a "shotgun" national approach is a viable strategy is in the opposite situation, where a candidate's positives are geographically dispersed, such as in the case of the 1984 Reagan campaign.

The much touted 30-minute infomercials, the centerpiece of Perot 's strategy was successful in large part due to unconventional approach and a sincere desire on the part of the many Americans to understand the current domestic economic crisis. In the first two weeks of October, after getting back in the race, Perot personally spent $26 million, almost exclusively on advertising. (Berke 1992) Perot aired 11 half-hour programs including repeats. On October 5, Perot's first infomercial earned a startling 12.2 Nielsen rating. Previously in the paper, the tradeoffs between reach and frequency and size of the advertising unit were discussed. The negatives of extended length were controlled by airing the programs numerous times and supplementing Perot's efforts with :30 and :60 national and local buys.

The 1992 campaign had been unconventional from the start with an perceived "undefeatable" incumbent suddenly vulnerable, a governor from a small state who became embroiled in a sexual scandal and accused of being a draft dodger, and a computer salesman who came to the party uninvited by paying his own way. The final evening prior to election day ended the campaign on a recognizable note, with all three candidates appearing on national television and making their final appeals to voters. As the 1994 and 1996 campaigns beckon, the unconventional approaches of Perot and Clinton will likely become tomorrow's conventional wisdom.

Comparing Local Buying Strategies

Hagstrom (1992) stated that "political files" of advertising sales, kept in every radio and television station in the country are underutilized gold mines of data. During campaigns, the political buys are one of the most highly guarded documents prior to airing. Postelection analysis of these buys can provide scholars with new insights and validate the various strategical approaches used by candidates. The following results, while not inclusive of the total advertising buys placed in the Columbus, Ohio ADI (Area of Dominant Influence), hopefully will demonstrate the usefulness of this information. Postelection comparisons of the media buys made on behalf of George Bush, Bill Clinton, and Ross Perot on WSYX Television, the ABC affiliate, have been selected for examination. While the format of each station's billing form may vary, WSYX's billing form was extremely helpful because it also contained the identification number of each particular spot that aired. The buys that were selected aired from October 14 through November 2, 1992. This period dealt with the final three weeks of the general campaign.

The key time-buying questions posed by Hagstrom (1992) were "how much did each campaign spend, who was the campaign trying to reach, and how well did the campaign spend its money. To construct a data set from the buys, the November 1992 Arbitron rating book for the Columbus ADI was utilized, because it most accurately reflected the actual projected audience at the time of the campaign. The data set then became a combination of "public record" and Arbitron rating and audience composition information. From the WSYX billing record the following items were coded for: year, candidate, paid sponsor, airdate of the spot, number of times the spot aired, cost per spot, daypart and/or specific day of airing, general programming format in which spot appeared, and the spot identification number. From the rating book, the household rating, household share and number of total households in the ADI were coded. For comparative purposes, the same information was coded for women 25-54 years of age, working women, and men 25-54 years of age. Mathematical calculations, previously presented in the paper, of media cost and vehicles comparisons were calculated using SPSS.

How Much Did Each Candidate Spend?

The combined cost of the Bush, Clinton and Perot buys totaled $187,695. Of the total amount, $73,145 (39%) was spent on behalf of Bush, $76,720 (41%) on behalf of Clinton, and $37,830 (20%) on behalf of Perot. As one applies the three very different strategies utilized by the candidates, the Clinton "local buy" was the major workhorse that carried the campaign's two track messages. Perot simply complemented his heavy national buys with light localized :30s and :60s. The majority of the Bush cost was paid for by the Republican National Committee. It appears that the RNC was attempting to place more "tonnage" in Ohio in hopes of placing it in the win column. Ohio was a viable battle ground for all three candidates. As final results showed, Perot

took 21% of the Ohio vote.

How Many Gross Rating Points Did Each Campaign Buy?

Gross ratings points were defined as the sum of the rating for each spot purchased times the number of times each spot would air. A total of 194 spots announcements were coded. Of that total 85 were purchased on behalf of Bush; 84 on behalf of Clinton, and Perot bought 25. A total of 933 gross rating points, (based on TV households) were purchased in Bush's schedule; 875 GRPs for Clinton and 288 GRPs for Perot. In terms of cost per rating point (CPP), the Bush schedule had a CPP of $50.61, the Clinton schedule had a $52.54 CPP, while Perot had a CPP of $30.02.

How Many Gross Impressions Did Each Schedule Produce?

Gross Impressions are calculated by multiplying the schedule's GRPs by the number of television households or persons in thousands. GIs do not take into consideration the duplication of households or persons seeing an impression more than once.

	Bush GIs	Clinton GIs	Perot GIs
Women 25-54	15,534	14,262	5,715
Working Women	7,750	7,350	3,244
Men 25-54	12,278	10,396	4,658
TV Households	213,436	179,116	79,044

What does this comparison demonstrate? As target audiences are more broadly or more narrowly defined, the opportunity to expose the right group at the right time to the right message becomes more complex. It appears that the base target that all three candidates' schedules were focused on, was TV Households, rather than narrowcasting their targets.

How Much Did Each Schedule Spend on a CPM Basis?

	Bush CPMs	Clinton CPMs	Perot CPMs
Women 25-54	$2.62	$2.82	$1.06
Working Women	$4.34	$4.78	$1.85
Men 25-54	$3.57	$4.19	$1.79
TV Households	$2.95	$3.31	$1.11

CPM is seldom used as the sole criterion for buying airtime. One observation to make is that the Bush and Clinton media buyers were 20 cents apart on the CPMs for Women 25-54 and 36 cents apart on CPMs for TV HHs across some $150,00 in local buys. One can surmise that the rules of thumb for buying media scheduling is part art-part science. A realistic factor that also may account for greater differences, beyond the strategic differences in target audiences, is the supply and demand of time. Airtime is a finite commodity that is sought by multiple political candidates and commercial products and

service. The fourth quarter is normally when most stations have the greatest demand for time. A presidential campaign year further tightens a short inventory of the most desirable time slots.

How Did the Schedules Handle the Tradeoffs of Reach and Frequency

As discussed previously, reach (different households) versus frequency (same households) are inversely related. What was the reach compared to the average frequency differences between the schedules?

	Bush Reach	Clinton Reach	Perot Reach
Women 25-54	40%	37%	12%
Working Women	34%	32%	11%
Men 25-54	35%	30%	9%
TV Households	57%	52%	16%

Bush AvFreq	Clinton AvFreq	Perot AvFreq
14.6 times	14.7 times	5 times

The calculations indicate that over the three schedules, about half of the television households who watched WSYX saw about as many Bush spots as Clinton spots. If one divided the average frequency over the three week period, is close to a 5 spot average frequency per week a realistic assumption? Yes and No. The continuity strategies discussed earlier, reveals a clearer picture.

Airdate	Bush #/day	Clinton #/day	Perot #/day	
10/14	11	3	--	n=14
10/15	1	1	--	n=2
10/16	2	4	1	n=7
10/17	--	--	--	---
10/18	2	6	1	n=9
10/19	5	12	1	n=18
10/20	6	7	--	n=13
10/21	9	5	1	n=15
10/22	2	3	--	n=5
10/23	--	1	1	n=2
10/24	3	3	--	n=6
10/25	1	3	1	n=5
10/26	7	5	3	n=15
10/27	11	12	2	n=25

Airdate	Bush #/day	Clinton #/day	Perot #/day	
10/28	6	2	3	n=11
10/29	9	2	3	n=14
10/30	2	3	1	n=6
10/31	4	3	--	n=7
11/01	4	3	2	n=9
11/02	--	7	6	n=13
	n=85	n=84	n=25	n=194

Scanning the columns of Bush and Clinton commercial frequency, a strong pulsing pattern can been seen. The continuity patterns do not fit the "flat buy," the "orchestrated finish," or the "stop-start". Without reconstructing the campaign events on the peak frequency days, the "event schedule" pattern probably is not the best fit either. However, the Perot buys appear to fit the "orchestrated finish" continuity strategy. The Bush and Clinton buys both conform to the pulsing strategy.

Did the Media Schedules Differ According to the Time of Day?

Of the 85 spots purchased on behalf of Bush, 65% of the spots were placed in more cost efficient Monday-Friday schedules. The flexibility of allowing the station to place the commercial within the time requested, but the actual day is not as critical is an economical approach. This also is an efficient way to buy programs that are daily. Rating books bear out that over a four-week period, the average rating shift across all five days is minimal. Fridays may have more viewers, for example for game shows and soap operas. Syndicated programming which often contains disconnected episodes are not worth spending the extra dollars for the day specification. Only 35% of Bush buys were purchased on specific days at specific times. Approximately 57% of Clinton spots were Monday-Friday broad time slot purchases, 43% were placed in fixed day and time slots. Perot's 25 spots were equally divided between flexible and fixed dayparts.

In the fixed day purchases, Tuesday a.m. and p.m., Thursday p.m., Saturday p.m. and Sunday p.m. were the most frequently bought for Bush. Whereas, Monday a.m. and p.m., Tuesday p.m. and Sunday p.m. were purchased most frequently for Clinton. Monday a.m. and p.m. and Sunday p.m. were the most frequent choices for Perot. Across the three candidates, Sunday p.m. and Monday p.m. contained with most presidential campaign commercials. Tuesday p.m. and Saturday p.m. collectively were nights that viewers may have seen commercials for at least two for the candidates.

How Did the Type of Program Impact the Buys?

Conventional wisdom held. Designated spot buys appeared most often during local newscasts and news oriented-type programming. Clinton purchased the most commercials during football -- 4 compared to Bush's 2 and Perot's 1. Situational comedies also fared well. Specials were purchased frequently by all three candidates. Bush and Clinton placed a couple of spots during daytime talk shows. Clinton also purchased 3 designated soap opera spots during the three week period. Depending

on the particular soap opera, viewers may schew toward the younger college age demographic.

Recalling Presidential Campaign Advertising

An indept postelection telephone survey was conducted in the Columbus, Ohio ADI. Respondents were asked, "Of the television ads for the presidential candidates that appeared during the campaign, please describe which one, if any, influenced your most in your thinking about the candidates." Of the 931 respondents, approximately one-fourth (n=226) gave a response to the question. Some of the descriptions of candidates' commercials ranged from very detailed recall such as "the Time magazine one that Bush did about Clinton," or "the Clinton ad showing Geroge Bush saying 'Read my lips'," or "the Bush ad on Clinton's Arkansas record with the vulture in the tree." Descriptions such as these can be traced back to a specific commercial. By incorporating data from candidate media buys, the frequency of particular spots can calculated to bring a greater understanding between what is being recalled, and the intensity of the message in terms of dollars and rating points invested to deliver a specific message. Other respondents' responses appear more condensational innature, such as "Perot's ads were really robust and grabbed my attention, and "I thought all Bush's ads were very negative." Likewise, the actual media placement schedule can more accurately assist in restructing the political advertising environment to later be compared with an individual's media usage levels, need for orientation and ideological leanings.

Limitations of the Study

Data presented from calculations derived from the WSYX presidential buys may not be representative of the final findings from all local tv station buys placed in the Columbus ADI. The impact of national network buys will need to taken into consideration as both local and national level buys simultaneously impact voters. Other media such as radio and direct mail currently have not been calculated. The current findings from the 1992 campaign strategy may not be generalizable to future races.

Areas for Future Research

The current study should be considered exploratory. Analysis of media buys from earlier electronic campaigns could be incorporated into revisionist efforts. Future researchers may also want to consider how levels of gross impression "tonnage" effect various types of voters. Further studies should consider how to utilize reach and frequency research to make meaningful contributions to the effectiveness of public information campaigns. Experimental research could examine the exposure levels at which the agenda-setting function of mass communication may occur across varying circumstances and viewers.

THE ETHNOPOLITICS OF SECESSION:

EXPLAINING SEPARATISM IN THE USSR

Lawrence Robertson
Department of Political Science
University of California, Los Angeles
4289 Bunche Hall
405 Hilgard Avenue
Los Angeles, CA 90024-1472

Prepared for delivery at the 1993 American Political Science Association Annual Meeting, Washington, DC, September 2-5, 1993. Copyright by the American Political Science Association.

I would like to thank Andrzej Korbonski, Ronald Rogowski, Rogers Brubaker, Ivan Berend, Arthur Stein, James DeNardo and Barbara Geddes for their support and comments. Robert Jackman and Brian Silver and the participants in the 6th Annual SSRC Summer Workshop on Soviet Domestic Politics also provided valuable feedback.

This paper, drawn from my dissertation in progress, develops a framework to explain why different concentrated ethnic groups exhibit different preferences for autonomy from the state. I test the scheme with a multiple regression on the fifteen Soviet republics, which exhibited different degrees of secession from the Soviet Union over its last years, 1988-1991. First, the paper explains why secession and the disintegration of the USSR present interesting theoretical puzzles for political science. Then I consider the importance of separatism for world politics. Third, a literature review examines previous work on ethnonationalism and its limitations as explanations for separatism and the variety of its appeal for ethnic groups. Then I develop a rational choice framework from the ethnopolitics literature to explain the variation in the appeal and extent of ethnic group secession from a multinational state - the USSR. Fifth, I test the model and consider the limitations of the framework in explaining the separatism of the fifteen Soviet republics. Finally, I consider the conclusions of the model and some implications for states and groups worldwide.

The Anomaly: Ethnic Secession and the Soviet Disintegration

Nationalism at its core is the principle that groups based on territory, culture, language, or ancestry, should have their own administrative units.[1] Given the domination of world politics by states, groups ought to prefer this form. Yet states are overwhelmingly multiethnic constructs. A plethora of alternate configurations are possible based on national principles for almost all states. Despite a number of new states splitting from existing units in recent years, the preponderance of ethnic groups in multiethnic states worldwide demonstrate scant secessionist impulses. Why does the organizing principle of nationalism remain unevenly applied?[2] Why do some ethnic groups exhibit separatist preferences while others remain quiescent? What factors shape ethnic group aspirations for independence or provide incentives to remain in the central state?

The Soviet Union was one of the world's most multi-ethnic states. The March 1989 census identified 108 indigenous ethnic groups, 21 of which numbered over a million people.[3] Administration was based on national-territorial units organized around 54 officially recognized, autochthonous, concentrated groups. Yet despite the potential for ethnonationalism, the USSR appeared only marginally affected by worldwide separatist trends; both the burst of nationalism leading to independence in the developing world with decolonization in the 1950's and 1960's and the resurgence of minority nationalisms in the developed world in the 1970's found only a faint echo among Soviet minorities. While few believed hyperbolic assertions from Soviet leaders that the nationalities problem had been "solved,"[4] there was little expectation that minority nationalisms represented any immediate threat to the stability of the USSR - let alone its existence - among either western or Soviet experts in the mid-1980's.[5] The general research agenda on nationalism in the

[4]Nikita Khrushchev boldly stated that "the Party has solved one of the most complex of problems ... the problem of relations between nations" at the 22nd Party Congress in 1961. See Pravda, October 18, 1961, 1. By the 26th Party Congress in 1981, Leonid Brezhnev was more restrained and included qualifiers: "the Soviet nationalities are now united more than ever ... this does not imply that all the problems of the relations between nationalities have been resolved." See Pravda, February 24, 1981, 3. Mikhail Gorbachev rejected even these moderate claims in his keynote speech to the 27th Party Congress in 1986. Instead he first noted that "contradictions" remain in "national processes", only then maintaining that "the Soviet people" have a "unity of economic interests, ideology, and political goals." See Pravda, February 26, 1986, 5. As cited in Gail Lapidus, "Ethnonationalism and Political Stability: The Soviet Case," World Politics 37 (July 1984).

[5]This stability consensus is evident in the work of Lapidus. In a critique of the few analyses of the nationalities problem that viewed the system as unstable, she concluded that "new [national] elites are more likely to direct

USSR thus concentrated on Soviet management of the nationalities problem and explaining the stability of the Soviet system.[6] While scholars doubted that national divisions would be overcome in the future, even skeptical studies tended to view the future of the nationalities question in the USSR at equilibrium - at "impasse" - rather than leading to the dissolution of the USSR.[7]

However ethnic nationalism exploded in the Soviet Union in 1988 and became increasingly assertive to the point that the Union "ceased to exist" on December 25, 1991. The research agenda has similarly changed to explaining why the formerly stable system disintegrated.[8] Fifteen independent states have been created and other concentrated ethnic groups have upgraded their administrative status within republics, and some have still more secessionist aspirations. Different ethnic groups exhibited different propensities to secede from the USSR and its union republics over its final years, 1988 to December 25, 1991. This resulted in different degrees of secession for titular ethnic groups of the former fifteen Union republics.[9] As in these cases, separatism is neither an easy nor obvious policy for ethnic groups worldwide. While all ethnic groups seek greater "self-determination,"[10] that is greater local powers vis-a-vis the central state, not all are separatist.[11] Greater local autonomy can be sought in a variety of issue areas and through a wide range of means. Nevertheless, the desire for greater local powers vis-a-vis the central state shapes all of these goals and drives all of these processes. Regions with concentrated ethnic groups in the USSR and other states expanded their prerogatives at different rates and to different degrees.[12]

What explains this variation in national separatism? Theories of nationalism or ethnopolitics identify either broad global trends or the attributes of ethnic groups and regions as the driving forces behind ethnic group assertiveness. The inducements and disincentives to secession from the international system affect different regions and groups in different ways: thus the variation in ethnic secession from the Soviet Union must be explained by non-systemic variables. Concentrating on the differences in secession within a single state over a short period of focuses on how the effects of international factors varies across ethnic groups and regions. This research strategy isolates the effects of central state policies and institutions and ethnic and regional attributes on increased assertions of sovereignty.

The interplay of these variables is at the center of political economy. Political economy suggests how political and economic factors affect self-interested individuals and the subsequent affects of these factors on politics through the organization of individuals for collective action.

---

their energies toward within-system demands than toward secession" and that "rising nationalism, in the absence of a major military conflict on Soviet territory, is unlikely to pose a serious threat to the stability of the Soviet system." See "Ethnonationalism," 579, 580. Soviet ethnographers, while producing nuanced analyses of problems in minority relations and how national characteristics endure, ignored the implications of these difficulties for the Soviet system. See, for example, the research in Iuri V. Arutiunian and Iulian Bromlei, eds., Sotsial'no-kul'turnaia oblik Sovetskikh natsii: (po materialam etnosotsiologischeskogo issledovaniia) (Moscow: Nauka, 1986).

[6]Walker Connor emphasizes how the Marxist-Leninist strategy for using and managing nationalism proved successful, at least initially, though it later contributed to minority nationalism in each of the socialist countries. See The National Question in Marxist-Leninist Theory and Strategy (Princeton: Princeton University Press, 1984).

[12]Miroslav Hroch, Social Preconditions of National Revival in Europe (Cambridge: Cambridge University Press, 1985).

Ethnicity, embedded as the organizing principle in the ethnofederal institutional framework of the USSR, focused the attention of individuals on territorialized ethnicity.[13] The Soviet system was also etatist; planning and the predominance of state property meant the resources of the system were concentrated in the state. Consequently the aspirations of individuals and collectivities focused on state institutions, the focus of much of political economy as well as new works on nationalism.[14] Political economy thus suggests a research strategy to investigate what structures individuals and groups seek as the proper unit of political life.

The Importance of Understanding Secession

The breakup of the Soviet Union presents an opportunity to examine why and how nationalities choose to secede from the existing state in favor of creating their own state or irredentism and why other ethnic groups limit their separatist aspirations. The decision to create an independent state is not taken lightly. Separatist decisions in the Soviet Union were controversial and nontrivial, with costs to the ethnic groups and the center Limits on the process of cascading sovereignty in the pre-coup USSR, the continued effort to maintain some multilateral ties through federation, confederation, or commonwealth after the end of the Union, and the previous experience of Soviet nationalities with creating independent states between 1917 and 1923 demonstrate the difficulties and uncertainties of separatism.[15] While the number of potential ethnic seceders is tremendous since states are overwhelmingly polyethnic and increased autonomy remains a goal of minorities, separatist aspirations tend to remain limited, and secessionist outcomes are rare.[16] Until the fragmentation of Yugoslavia and the USSR in 1991, Bangladesh was the only successful secessionist case since the end of the colonial era.[17] The study of secession from the Soviet Union, an ideal setting to examine a number of cases while controlling for international factors, offers conclusions for ethnic separatism worldwide. Irredentism too is rare, though many international borders are not coterminous with ethnic boundaries, and its unpopularity among the nations of the former Soviet Union also offers cases for comparative analysis.[18]

Ethnic conflicts are some of the more intractable problems across the globe today. Communal strife brings misery to millions of people worldwide. Understanding the inducements and disincentives to national secession presents opportunities for managing the separatist aspirations, up to and including full independence, of some ethnic groups while anticipating and shaping reasons to retain present ties and limit the secession of other groups. Central state policies profoundly influence the extent of separatism sought and the degree of secession attained.[19] A better understanding of the reasons and calculations of ethnic groups can lead to the development and better implementation of national and international policies to minimize the conflicts inherent in increasing ethnic autonomy and thus has the potential to improve group, national, and international

The influence of the state on the context of nationalism was also stressed by Rupert Emerson in From Empire to Nation: The Rise to Self-Assertion of Asian and African Peoples (Cambridge: Harvard University Press, 1960).

welfare.[20] Ethnic struggles for autonomy can evolve into communal strife and escalate into destructive civil wars as in Sri Lanka. Neighboring states find it difficult to avoid becoming involved in nearby conflicts.[21] New states created by successful secession face uncertain security situations in unstable regional contexts, grievances with their neighbors and former compatriots, and new political institutions available for exploitation by xenophobic politicians.[22] New states themselves are seldom uniethnic, and interethnic relations in the new state change with independence. Soviet secession is especially important since so many ethnic groups create so many potential troublespots, the massive restructuring project of the new multiethnic states may lead to greater ethnic assertiveness, and the nuclear capabilities of the former Soviet Union mean that conflict contagion could be particularly catastrophic, with horrendous consequences beyond the region.

Nationalism is returning to the foreground of issues in political science and for policy. Political science has begun to return its focus to questions about the organizing principles of states - how units are aggregated and subdivided and why they take various organizational principles.[23] As centralized threats to international order wane, the impact of proliferating the units in the system on American interests has become one of the key questions at present and for the future. American policy has been biased against secession, as our efforts to perpetuate the Yugoslav and Soviet states and to keep Kurdistan from developing full statehood demonstrate. Such policies have proven shortsighted and increased the welfare losses of separatism for all sides - including the United States.[24] A better understanding of secession would suggest when and how American policy can make a difference and reduce the costs of ethnopolitics for all states and groups.[25]

Competing Explanations and their Shortcomings: A Review of the Ethnopolitics Literature

The political science literature on ethnic conflict has been drastically revised over time.[26] Initially, economic development was hypothesized to reduce ethnic strivings for autonomy. Modernization was expected to reduce atavistic loyalties such as ethnicity.[27] However, as

[27]For criticism of these modernization assumptions, see Michael Hechter, Internal Colonialism: The Celtic Fringe in British National Development, 1536-1966 (Berkeley: University of California Press, 1975) 16-30; and Arend Lijphart, "Political Theories and the Explanation of Ethnic Conflict in the Western World: Falsified Predictions

empirical data demonstrated ethnic assertiveness tended to increase with modernization, more "reactive" theories emerged that postulated economic development led to nationalist reaction against modernization by unassimilated, backward ethnic groups.[28] On the other hand, a "developmental" perspective argued backward peripheral regions sought greater independence precisely due to resentment over the lack of development.[29] These theories have been discredited by events and supplanted by more complex paradigms. Separatism from the USSR also demonstrates the inadequacies of these models. All ethnic groups in the former Soviet Union, from most to least developed, sought expanded competence, though to different degrees and at different paces. National aspirations focused on further modernization rather than a return to traditional economic patterns, though some past development was criticized as inappropriate.

The now dominant tradition in political science explains ethnic mobilization as a consequence of group competition with other collectives.[30] As Joseph Rothschild states: "the engine of ethnic conflict" is "perceived ethnic inequalities and inequalities in access to and possession of economic, educational, political, administrative, and social resources."[31] However, the motor of competition and the links between ethnic conflict over mobility opportunities and outcomes remains poorly understood and is seldom specified.[32] Nevertheless, the calculations of territorially concentrated ethnic groups on separatism ought to be based on individual members' estimations of their personal prospects in a new nation relative to the undivided state.[33] These calculations should have two relative comparisons as their basic components: first, what job prospects are expected in the new state compared to those forecast under the already existing central state and second, how will development in the new state affect future mobility compared to job prospects under the development program of the undivided state. While the outlines of this theoretical perspective are clear, operationalization remains difficult. The relevant actors, how they assess their current mobility prospects, and the factors they consider in assessing their future occupational trajectories remain problematic.

Theories that examine ethnic competition present two competing paradigms. One emphasizes the difference between groups and regions with a Cultural Division of Labor (a vertical hierarchy of groups) as opposed to a Pillarized Society (a parallel segmentation of groups).[34] While in practice, the differences between these two types make assigning specific cases in either category difficult, a strong version of a Cultural Division of Labor (CDL) has at least two groups, one of which is clearly "superior" to the others.[35] On the other hand, a strong version of a Pillarized

Society (PS) has at least two stratified ethnic groups, that is each group has their own elites qualified to manage group or regional affairs.[36] These groups exist side by side and therefore compete for resources and mobility opportunities. CDLs are believed to inhibit secession since the ethnic group at the bottom lacks the kind of elite necessary to organize the group for collective action and manage state or economic institutions in the region. PSs have precisely such a counterelite which seeks to expand its competence through secession. The hypothesized differences between the strong versions of a CDL and PS can be demonstrated to be practically nonexistent in economically developed states. Even in the most discriminatory system, South African blacks have a developed political and economic elite, which is both adequate for autonomy and leadership of the larger state and indeed demands these roles; even apartheid failed to produce a CDL.[37] While some nationalities in the Soviet Union have proportionally fewer members with higher education, bureaucratic employment, and Communist Party membership than other ethnic groups, all nationalities have sufficient cadres to lead the ethnic group and manage local institutions. Thus, while some ethnic groups have larger and better developed elites than others, and correspondingly other minorities are proportionally less educated, white collar, and party members, there are no CDL relationships in the USSR. Other scholars have noted that the crude categorization above fails to capture the complexity of intergroup relations; in reality the patterns of relations between ethnic groups is far more complicated. Instead, more complex paradigms, such as Rothschild's "reticulate model", have been developed that attempt to take cross-cutting cleavages into account.[38] But institutionalized discrimination or affirmative action based on ascriptive ties breaks these more complex group affiliations back closer to "we-they" differentials.

Another set of explanations of separatism examine how single factor changes lead to expanded assertions of autonomy. External factors from both the international and undivided state level affect group calculations. For example, the spread of the doctrine of self-determination across the globe,[39] and the decline of coercion in Soviet politics facilitates ethnic assertiveness.[40] Yet these two factors should affect all ethnic groups in similar fashions. The variety of responses to similar factors calls for an explanation based in the attributes of ethnic groups and regions. By limiting the sample to ethnic groups in one country, the USSR, and a few years, 1988-1991, both international and consistently applied central state policies are similar across all cases. While these factors explain part of sovereignization, they cannot explain variation within the former Soviet Union. Single factor explanations have limited domains which can be exceeded by a more general model which explains general causes of secession as well as the variations apparent in its appeal.

A third group of explanations focus on group or regional attributes or a combination of these factors as explanations of separatism. Some efforts simply produce a list of factors that cause secession; one example requires a conjunction of "primordial" and recently acquired "secondary" factors, triggered by a catalytic threat of competition with other groups, which is then affected by leadership, government, conflict management, and international factors.[41] No coherent argument about secession arises from such a "kitchen sink" method. Process models, like the one developed by C.J.F. Whebell,[42] examine continuous dependent and independent variables, but again fail to

examine how the independent variables they identify are related to secession; the model proposes that territorial separatism may arise from any dimension of each variable: territorial definition, institutionalization, arena of stress, and culminating events. The model thus only suggests when "conditions predisposing to separatism exist."[43] Other attempts at analyzing secession produce typologies rather than theories. The common fault in these analyses is the refusal to sketch out relationships among variables and elaborate particular causes and paths of secession. However, they self-consciously consider the crucial impact of state policies toward ethnic minorities and regions. Anthony D. Smith differentiates among separatist movements, who first need the preconditions of self-consciousness of a common history and discontent from centrally-blocked mobility opportunities, on the basis of how the central cycle of economic and social expansion and contraction, the political cycle, the changing social composition of the ethnic group, and specific government policies toward the ethnic group affect separatist aspirations.[44] John Wood's effort, after producing a long list of variables, concludes by explicitly rejecting theory:

> if certain preconditions are adequately met, a secessionist movement is likely to emerge; if it develops effectively, the central government may respond either accommodatively or repressively; if accommodation fails, a secessionist attempt may be precipitated by a number of possible events; if civil war ensues, its outcome will be affected by a number of factors, many of them unknowable in advance. Secession can apparently occur or be stopped at any of the stages we have described. Predicting secession is like predicting the moves of gamblers; even if one is familiar with their predispositions, understands their rules, and knows the cards they hold, one still cannot foretell the outcome of their game.[45]

Similarly, Alan B. Anderson presents typologies of nationalism based on the status of a language minority relative to other groups and geographic divisions, government policy, and how minorities react to state policies.[46] No patterns of relationships are identified, and no causal connections are considered.

Finally, efforts to explain the surge in nationalist agitation in the Soviet Union proposed hypotheses about ethnic separatism. My dissertation tests the basic arguments offered in these more nuanced treatments at some cost to their consideration of exceptions and other factors that alter the models' expectations.[47] Three frameworks can be formulated as theories, though the authors left their hypotheses unformalized.

Philip G. Roeder posed a scheme based how federal institutions and central government resource redistribution create or inhibit mobility opportunities.[48] Previously complacent titular groups are activated by officially sanctioned ethnic elites in developed Soviet regions. Elites mobilize ethnic constituencies to lobby the center for increased resources needed to contain increasingly serious mobility pressures in regions facing declining economic growth, a large, previously developed, potential counter-elite, and a saturation of professional positions. Mobilizing the masses serves to pressure the central government to reduce interrepublican income redistribution, which generally transferred funds from advanced to backward regions to equalize development. Continued income redistribution causes separatism, though titular aspirations focus

initially on autonomy and sovereignty rather than independence.[49] Developed regions remain interested in ties to the center if the subsidization of other areas is reduced. How more favorable economic relations can be created between the region and the center are compared to existing center-periphery ties in considering the degree of separatism sought. Secessionist aspirations are raised as institutional changes such as competitive elections allows titular counterelites to replace previous national cadres. Yet nothing in this model suggests why or when institutional changes occur. The model does not specify when occupational pressures and income redistribution lead to protest. In addition, the reaction of subsidized regions to reductions in central funds is ignored; secession is considered for only part of the universe of Soviet ethnic groups. Also no attention is given to the inducement of promotion possibilities outside titular ethnic regions. Extraregional mobility, especially for well educated ethnic groups, while presenting certain costs in language acquisition[50] and somewhat limited in the extent of vertical mobility possible, offers alternative mobility channels. Third, the assumption that smaller ethnic groups are less separatist from their "far greater possibilities for individuals to achieve moderate success climbing the Soviet mobility ladder" seems unwarranted, unrelated, and contrary to methodological individualism.[51] Adding economic issues and their effects on mobility opportunities clears up the evident confusion about central sanctions against separatism, adds disincentives to association for groups, and expands the universe to the smaller, non-republican titular minorities that Roeder simply assumes are attracted to assimilation with Russia. An interactive model of how central subsidization and exploitation affect mobility opportunities is required to capture the full secession picture. Thus the Roeder model tells only part of the secession story.

David D. Laitin's analysis considers the full range of groups and adds these external opportunities to elites' calculations; ethnic leaders who have assimilated into the society and culture of the center attain "most-favored-lord status" with concomitant opportunities for extraregional or central promotions while elites denied such opportunities focus their aspirations solely on their national areas.[52] The Elite Incorporation Model (EIM) predicts that less separatism among favored groups - the opposite of the Roeder model's expectations. Regional elites denied central mobility focus inward and increasingly look toward secession. However, Laitin only considers the inducements to continued union membership rather than any disincentives. Economic factors are only considered in ad hoc fashion when considering "other variables that might have influenced the pattern of outcomes" although economic dynamics pervade the analysis.[53] National groups consider the existing relationship with the center and the other republics, possibilities for improving the regions standing in the system, and how increased independence would leave the economy.

Donald Horowitz proposes a parsimonious, consistent framework which applies to the full universe of logically possible cases. Secession calculations are functions of relative group and regional position in the undivided state. Examination of a wealth of Asian and African cases

[53]Laitin, "National Uprisings," 158.

demonstrates the power of his scheme.[54] Another brief essay considers how the framework informs the Soviet case.[55] Ethnic groups are either "backward" or "advanced" in socioeconomic status, which determines their position relative to other ethnic groups in the competition for mobility opportunities. Regions too are either "advanced" or "backward", based on the strength of the local economy, which provides mobility opportunities without the central state. Ethnic group leaders consider their relative prospects in an independent ethnoterritorial unit verses continuing in the larger state. The conjunction of the two independent variables creates four different groups of secessionists, with different preferences on autonomy and different paths to secession (See Table 1). However the framework devotes insufficient attention to the inducements of subsidization and disincentives of exploitation provided by the unified state, though these enter his discussion of Soviet separatism. I argue the scheme misspecifies the economic variables, at least in the ex-Soviet cases. Instead of regional attributes, central state policies are critical, as Horowitz seems to note in his discussion of the Baltic and Central Asia republics. Rather than the relative level of regional development, how the undivided state treats the region shapes the preferences of ethnic elites. While Horowitz implies advanced regions are exploited to subsidize backward regions. While logically consistent, this is not always true in practice. In the USSR, some backward regions were net contributors to the center while other advanced regions were subsidized. Ethnic elites compare existing ties to their potential as more independent actors rather than assess their absolute potential as independent regions. What concentrated ethnic groups lose or gain in their current relationship with the larger state is crucial in economic as well as mobility opportunities. Finally, the model is static. No notion of how development changes relative positions and secession calculations is made.

The Future Mobility Model and Testable Hypotheses

The Future Mobility Model expects ethnic groups to move toward secession when the opportunities for occupational mobility are more promising in their own regions than in the larger state and when the central government provide few economic subsidies to the area or extracts revenue from the region. It expects occupational mobility prospects to drive individuals' calculations of what degree of secession is in their immediate interest. Increased autonomy means that management once provided by the center now may be produced locally; thus new jobs are created under ethnic preference systems that favor titular groups. Also, members of other ethnic groups, who now face discrimination, are likely to return to their own national areas, opening their old positions for mobility under the system of titular preference. Whether the central government augments mobility prospects in the region through investment or inhibits development there by extracting resources from the region affects the occupational mobility of individuals in the medium and long term. The distribution and redistribution of funds via investment and price subsidization and through taxation and price discrimination affects both the overall level of economic growth and job creation and the distribution of this development - that is, what kind of occupational mobility opportunities are created through the new jobs and the geographical location of this development. Increased flows from the center to the region mean greater future mobility opportunities, which ethnic groups hope to distribute disproportionately to members of their groups, though these increased opportunities are also likely to draw members of other ethnic groups to the region. A decline in central resource transfers to the region or extraction of regional funds for the development of other areas contracts occupational mobility opportunities, which increases the competition for the remaining positions. Some imported workers may leave as their job promotion prospects decline, who will then be replaced under the ethnic preference system by the titular ethnic group of the area.

Ethnic secession is thus hypothesized to be a function of ethnic occupational mobility and central policy toward the region. Occupational mobility depends on the distribution of existing

---

[54]Horowitz, "Patterns of Ethnic Separatism," Comparative Studies in Society and History 23 (April 1981) and Ethnic Groups in Conflict (Berkeley: University of California Press, 1985), chap. 6.

[55]Horowitz, "How to Begin Thinking Comparatively About Soviet Ethnic Problems," in Motyl, ed., Thinking Theoretically.

positions in the region and at the center, while central subsidization or the extraction of funds from the region affects the number and type of regional and extra-regional mobility opportunities that accompany development in the future. The model expects individuals to assess their prospects for advancement on these two grounds. Opportunities are evaluated in relative terms; that is, individual members of ethnic groups consider whether continued development in the rest of the existing state or more autonomous development without transfers of funds through the central state offers greater mobility prospects. Central aid produces greater mobility opportunities overall through development while a loss of regional funds to the center constricts future development. These transfers simply create jobs; how the change in the number of occupational mobility opportunities affects the distribution of these positions among ethnic groups depends on the local administration, economic bureaucracies, the market, and the central government.

Occupational mobility most broadly means moving from rural to urban areas. Good jobs in most societies are overwhelmingly located in urban areas; promotion to factory employment or especially white collar occupations provides higher salary, benefits, and status than rural employment. Typically, urbanization results in closer interaction with members of other ethnic groups; consciousness of individual and group competition increases through this contact, as individuals grow to understand that some policies are designed to promote the welfare of one group compared to another.

Ethnic competition for mobility opportunities is at two levels: first, in the regions in which groups are concentrated and second, at the larger state level. As a consequence of uneven economic development, ethnic group urbanization and education levels and occupational distributions vary within states.[56] Some groups which benefited from early development attain urban positions in areas of other ethnic groups; emigration reduces mobility pressures in their own ethnic areas through moving to different regions or the center. However, urban and potentially urban members of titular ethnic groups resent immigrants, who inhibit their own opportunities for occupational mobility. Members of this titular ethnic group can also look to occupational mobility outside their own area, but again as a consequence of uneven or late development, the group and its members lack the education and work experience to successfully compete for positions at the center or in other national areas.

This two level competition results in the creation of two different types of ethnic groups based on their relative successes in occupational mobility. Groups are "urban population importers" when more of the urban positions in their titular areas are occupied by members of other ethnic groups than members of the titular group's urban population have immigrated to urban areas outside the republic. Importers thus are groups with more urban positions in their titular area than titular ethnic urban populations currently occupy in their region and in the larger state combined. The intuition behind this variable is that ethnic group members consider their mobility opportunities in the existing state relative to their prospects in an independent state; that is, they think about their job prospects in the national area if all co-ethnics were forced to return and all immigrants expelled. Importers would have an excess of urban positions in such a hypothetical population adjustment and thus plentiful mobility possibilities in their region. Conversely, groups are "urban population exporters" when more of their urban populations have emigrated than immigrant ethnic groups have occupied urban positions in their titular areas. Any population resettlement would place tremendous pressure on the few local mobility opportunities by former urban emigrants. Wholesale population resettlements are both extraordinarily painful in human terms and seldom total. Nevertheless, this way of thinking is the logical conclusion of theories of ethnic group competition for occupational mobility, and arguably, the way that the issue is examined by the

---

[56]See for the Soviet cases, Roman Szporluk, "The Imperial Legacy and the Soviet Nationalities Problem," in Lubomyr Hajda and Mark Beissinger, The Nationalities Factor in Soviet Politics and Society (Boulder: Westview, 1990); S. Frederick Starr, "Tsarist Government: The Imperial Dimension," in Jeremy Azrael, ed., Soviet Nationalities Policies and Practices (New York: Praeger, 1978); and Marc Raeff, "Patterns of Imperial Russian Policy Toward the Nationalities," in Edward Allworth, ed., Soviet Nationality Problems (New York: Columbia University Press, 1971).

competing groups themselves.[57] Precedents for such drastic population resettlements are also provided in by history and recent experience: for example, hundreds of thousands of Greeks and Turks were relocated in forced unmixing following the First World War, Amin deported all Asians from Uganda, and the wars of the Yugoslav succession have led to almost total unmixing of many areas of its successor states.

Membership in the larger state also has different consequences for various regions. Central policy either retards local occupational mobility opportunities by re-allocating taxation revenues from the area to other regions or results in an increase in the possibilities for occupational mobility in the region through central investment. The model considers the first type of central policy "exploitation" while the second is "subsidization".

Examining secessionist moves as the product of ethnic group members' calculations of personal benefit based on their prospects for occupational mobility at the center and in their region and the level of regional economic subsidization by central authorities creates four hypotheses about the timing and strength of secessionist aspirations.

H1: Titular ethnic groups of urban importer regions rapidly and strongly seek secession when their region is exploited.

H2: Titular ethnic groups of urban importer regions seek secession less rapidly and less strongly when their region is subsidized.

H3: Titular ethnic groups of urban exporter areas slowly and weakly seek secession despite the exploitation of the region.

H4: Titular ethnic groups of exporter areas more slowly and weakly seek secession when the region is subsidized.

The model expects the secession calculations of urban importers under H1 and H2 to be dominated by their importer profiles. Explanation for the variation between the strength of separatist assertions of ethnic elites from regions which are net urban population importers is expected from the subsidization or exploitation question. Hypotheses 3 and 4 are also dominated by the demographic position of ethnic groups. Exporters should limit secession relative to importers despite subsidization or exploitation, although some areas which export elites should be more prone to secession than other urban exporters due to economic exploitation. Both types of urban exporters should limit the timing and extent of secession compared to urban importers. The different inducements to separatism expected by the models four hypotheses are shown in Figure 1. The future mobility model, based on four independent variables, provides a set of expectations about the full universe of concentrated ethnic groups in a state and across states. In a nutshell, the model's hypotheses are that occupational mobility opportunities dominate calculations on secession, but since subsidization or exploitation affect mobility in the longer term, they factor into calculations about the future once immediate opportunities have been assessed.

Testing the FMM: Cases, Alternative Explanations, and Evidence

I first compare the expectations of the model presented above with those presented by the leading competing models to sharpen and made explicit their similarities and differences. Then I test the FMM statistically. The Soviet Union offers an excellent opportunity to test the variation in secession across cases. The 15 republics are classified by the indicators of the FMM and the three other frameworks (Table 1) Table 2 displays the extent of separatism expected in each republic as a consequence of each model's classification scheme.

The USSR serves as an excellent laboratory for examining ethnopolitics. The Soviet state was explicitly based on national principles. The structures of Soviet ethnofederalism made ethnicity one of the organizing units of politics and of individuals. Concentrated ethnic groups were granted formal autonomy in many spheres within a federal system.[58] However, in practice, the Soviet

[58]Joseph Stalin as Commissar for Nationalities was instrumental in working out the new Soviet system, though his strong anti-national views were moderated by Lenin. See the collection of Stalin's works Marxism and the National-Colonial Question (San Francisco: Proletarian Publishers, 1975); first published in 1934.

Union was a highly centralized system. The combination of a centralized federal system means that federal institutions provide the lines that delimit the secessionist units and central administrations collect the information across all the cases. Centralization meant that local administrators operated within constraints set by central policies in many issue areas, though local latitude existed in implementation in even the most central goals of the regime. Yet these formal federal prerogatives provided opportunities for occupational mobility for ethnic group members in which nationality was a consideration in advancement. Soviet policy sought to raise the educational and occupational levels of all ethnic groups by developing the regions in which they were concentrated.[59] The Soviet state-socialist system concentrated employment in state institutions. State ownership and management of all but individual production focused individual aspirations on the state as the provider of all mobility opportunities. The Soviet Union also was premised on the development. Socialism was supposed to be validated through modernization. Service and factory employment in urban areas grew with economic development. Higher education opportunities also grew. The proliferation of local administrative positions offered potential mobility avenues, in which titular groups were favored in employment.[60] Yet economic elites remained Slavic dominated and cities continued to be disproportionately populated by nontitular groups.[61] In addition, the slowdown in economic growth levels over time sharpened the competition for mobility opportunities. Simultaneously, demographic growth rates of many minority groups were high or expanding, which promised to increase job competition in the future. Also, in some areas under the traditional Soviet system, rural titular minorities resisted urbanization. These minorities viewed their job prospects realistically, and compared their welfare with the opportunities for individual enterprise and gain in rural areas with the more proscribed private enterprise possibilities in urban areas. Thus masses of poorly educated rural Uzbeks preferred rural routines and limited private enterprise to the uncertainty or urban areas even with preferential hiring policies.[62] But as individual incentives began to change with the demise of the "command-administrative" system and the transition to a market economy, such anomalous behavior in comparison to world experience seemed to dissipate. In the long run, unregulated migration to urban areas as in much of the Third World seems likely to replace this reluctance to urbanize. Not surprisingly, ethnic groups have become increasingly urban in the USSR with development. Members of ethnic groups in urban areas in the USSR understand that they compete with other ethnic group members for urban positions and corresponding social benefits.[63] Both

[62]See Nancy Lubin, Labour and Nationality in Soviet Central Asia: An Uneasy Compromise (London: Macmillan, 1984).

[63]Rasma Karklins found nationalities perceived a "clear 'we-they' differentiation" and competition between ethnic groups throughout her research. See "Nationality policy and ethnic relations in the USSR" in James R. Millar, ed., Politics, work, and daily life in the USSR (Cambridge: Cambridge University Press, 1987) and Ethnic Relations in the USSR: The Perspective from Below (Boston: Allen and Unwin, 1986).

the number and extent of economic opportunity and the quality of the social infrastructure and benefits increase with the size of urban areas.[64]

Titular republican ethnic groups remained disparate in levels of development. Economic development has been uneven across the Russian empire and then in the USSR. The centralized administered economic system had a greater repertoire of instruments for economic subsidization and exploitation. Income transfers were carried out through taxation and investment, as in market economies, and in the price system, by which central administrators favor some regions by placing high prices on their output while placing low values on the outputs of other areas.[65]

Soviet minorities, with a few exceptions, tended to remain in their homeland areas. Group cohesion was enhanced through concentration, which was further encouraged by the institutional structures of federalism. Soviet history, population trends over time, and recent experience also provide examples to focus individual attention on population transfers. Stalin forcibly deported seven entire national groups for alleged collaboration with the Nazis during World War II.[66] Moderate degrees of population unmixing have been ongoing in the non-European union republics since the 1960's and this indigenization trend accelerated and spread to all but Latvia and Estonia in the period of perestroika.[67] The war over Nagorno Karabakh has resulted in almost total unmixing of Armenians and Azeris in the Caucasus. Demographic issues and population movements have also been raised in wholesale terms in the Soviet Union and its successor states.[68]

The Roeder hypothesis about secession is that the "relatively advantaged" nationalities in the former Soviet Union will seek separatism rapidly and strongly, with the variation in the extent of secession of successful groups explained by the level of exploitation of the region. Roeder uses education data to determine relatively more and less successful groups considers the proportion of turnover and income taxes retained in the republic and the extent of republican budget subsidization from the USSR budget as measures of redistribution. In general, the hypotheses proposed by the Future Mobility Model concur with these predictions, but also offer hypotheses about the less successful nationalities in the USSR, their interest in separatism, and how "the federal politics of resources and life chances" lead to later and less secession among these cases that Roeder gives less than full attention.[69] The FMM hypotheses that ethnic group calculations on secession are different than those expected by Roeder, that the relevant national group population crucial in secession is broader than the educated population, and that alternative economic relationships are considered rather than simply thinking about improving the existing economic relationship with Moscow. The FMM argues that it is not the "success" of these nationalities that leads to secession, but instead the competition with other ethnics who are believed to be holding back these titular groups leads to separatism. Roeder's examination fails to explain separatism in regions which

[68]In terms of Soviet thinking, one publication of census data on the number of ethnic Russians living outside Russia and their distribution in the republics was titled "When I Return." See Literaturnaia gazeta 40 (October 1991), 2. In one republican example, article by a Kazakh demographer urged the repatriation of the 32% of the nationality that live outside the motherland in both the Soviet Union and in foreign countries. See Leninshil zhas, July 26, 1991, as translated from the Kazakh in Joint Publications Research Service - USSR Political Affairs, January 9, 1992.

[69]Roeder, 218.

have been subsidized to buy off mobility pressures. Armenia is an example of a republic which received large and long-term subsidies, but as central reallocations declined, and as crucial mobility opportunities formerly available in neighboring backward regions and at the center were proscribed, the urban population looked inward toward secession, though simultaneously continuing to attempt to maintain certain aspects of their former relations with the center. These are precisely the economic and occupational ties that provide opportunities for Armenian urban populations. Thus the existence of separatism at all in Armenia is problematic for Roeder, while both the extent of and the limits on secession in the republic are expectations of the Future Mobility Model.

The Laitin model of separatism has diametrically opposed conclusions to those of Roeder. Laitin hypotheses that most-favored-lord-regions rapidly assert some separatism, but the extent of secession is sharply proscribed. In non-most-favored-lord regions, secessionist pressures arise slowly but are more powerful. How ethnic elites were incorporated into the Tsarist administration when the regions first become part of the Russian empire generally makes Laitin's Elite Incorporation Model's predictions the opposite of the Future Mobility Model. Eyeballing the placement of the 15 republics and consideration of actual secession suggests that the EIM perspective leaves a great deal to be desired; rather than less advanced groups leading the charge for secession, more favored regions were more separatist. These conclusions better fit the FMM. Laitin's look at the nationalist revival stresses Ukraine as a model of a most-favored-lord republic. Yet substantially more urban positions in the republic are occupied by immigrants than Ukrainians hold outside the republic. Expanding the view of the politically relevant population emphasizes the costs of union membership for Ukraine and instead of emphasizing incentives to remain, as Laitin does, instead predicts early and frequent secession, especially since Ukraine subsidizes other regions. This rejection of the Union, rather than Laitin's emphasis on the importance of continuing ties with the center, seems more in accordance with the type of limited ties with other regions and expanded prerogatives for independent governance sought by Ukraine.

The Horowitz hypotheses about secession predict early and strong secessionist aspirations among backward groups in backward regions, late and less strong secession among advanced groups in backward regions, late and weak separatism among advanced groups in advanced regions, and early but weak efforts to withdraw from the existing state by backward groups in advanced regions. Some Horowitz hypotheses concur with Laitin, in that less favored groups from poor regions are rapid and strong seceders. This prediction is in contrast to the Future Mobility Model. The predictions of the Horowitz model are in contradiction with Roeder's expectations about the separatist aspirations of more favored groups, who Roeder predicts are more ardent separatists while Horowitz expects weak and late separatism. The Future Mobility Model concurs with Roeder on these cases. The predictive failures of Horowitz's argument are drawn out by the weak assertions of autonomy by backward groups in backward regions, which he hypotheses are early and frequent seceders. Instead, in the USSR, the groups and regions fitting this profile, like one of the Central Asian republics of Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, or Uzbekistan, lag behind in the process of cascading sovereignty. Though urban population importers, the central redistribution of funds is crucial for maintaining and expanding mobility opportunities for titular groups in these regions. Nevertheless, these regions are more secessionist than others. For example, the reluctance of Belarus' to take separatist measures is also captured by the Future Mobility Model, in which its urban exporter status and the continued inflow of central funds militate against secession, which is at variance with Horowitz's prediction of early but difficult secession for backward groups in advanced regions. The regional issue in contention appears to be the existence and persistence of subsidization or exploitation of the economic assets of the area by the center; rather than the attributes of the area, how the attributes are affected by current ties with the central state are crucial in secession calculations.

I then test the FMM through a regression of rank order extent of secession on four independent variables: the extent a republic was an ethnic urban population importer or exporter in 1970, the extent and direction of change in republic ethnic urban population profile, the extent a republic was exploited or subsidized in its relationship with the center in 1970, and the extent and direction of change in this economic relationship. The regression is thus:

SEP= b_0+UrbImp/Exp1970+ΔUrbImp/Exp1970-1989+Expl/Sub1970+ΔExpl/Sub1970-1989

The first independent variable, whether an ethnic group is an urban population importer or exporter, is measured by calculating whether an ethnic group is a net importer or exporter of urban job-holders in its national region based on 1970 census data (Table 3).[70] The second independent variable, the direction and the extent the net import or export of urban job holders changes.[71] The third independent variable, central economic subsidization or exploitation of the republic, the difference between National Income Produced and National Income Utilized per capita in 1970.[72] The fourth final independent variable, the change in the extent and direction of subsidization and exploitation of the republic is measured by comparing the change in the difference between NIP-NIU between 1970 and 1989.[73] The distribution of each of the variables approaches the normal distribution, which suggests regression analysis is appropriate.[74]

I define secession broadly as any effort to assert local prerogatives at the expense of the center. The focus on the rational choice of strategies by ethnic group elites and the evident escalation of demands for autonomy over time argues for an inclusive conception of secession, in which a variety of autonomy assertions are viewed on a continuum.[75] However, separatist aspirations are not necessarily monotonic; instead, some groups or regions may prefer the regional autonomy to the status quo, but independence may be considered inferior to expanded local prerogatives within the existing state or even to the status quo situation.[76] The extent of secessionist aspirations do change over time and vary within states, as well as among members of ethnic groups. The dependent variable, level of separatism, has been converted to a numerical score and then index for statistical testing. Legislative action and debate are used as the evidence of national aspirations - they demonstrate the amount of autonomy perceived to be in the interest of various nationalities. Yet they are more than preferences which are costless; legislation represented action with costs to participating groups and republics. The most glaring example of these costs was the month-long blockade imposed on Lithuania for its declaration starting the restoration of independence. Thus legislation represents separatist outcomes. For this paper, I have scored separatism on two indicators: sovereignty declarations and independence proclamations. Each indicator was scored on its timing relative to others and the strength of its demands for increased prerogatives. Four areas recurred in most cases for both components, which were scored 1-5 from least to strongest demands. I then summed the scores for each component and then summed the two scores, and finally ranked the republics' secessionist aspiration 1-15 based on this data (See Tables 4, 5, and 6). The two components that make up the secession score are highly correlated, suggesting that the components of the dependent variable are measuring the same thing.[77]

[74]One data point skews histograms of the two economic variables. The tremendous income transfers out of Lithuania in the 1970s and its change to subsidization in the 1980s make the republic an outlier for both economic variables.

[75]Horowitz, "Patterns," 169, and Ethnic Groups, 232.

[76]Hudson Meadwell, "Ethnic Nationalism"; and "A Rational Choice Approach to Political Regionalism," Comparative Politics 23 (July 1991).

[77]The Spearman Rank Correlation between sovereignty ranking and the independence ranking is .828. Each individual measure is more closely correlated with the combined measure, at .906 and .965 respectively.

The regression results in an explanation of 54.7% of the variance (Figure 2). While the model explains less than the full picture of secession from the Soviet Union, knowledge of the four variables provides more than half of the explanation. The direction of each variable's effects is in accordance with the predictions of the FMM. As the model expects, the strongest predictor is the change in ethnic urban population status over time. Surprisingly, the static indicator of economic exploitation or subsidization appears stronger than the dynamic measure. Possibly the stability of most economic relationships in the USSR over time reduces the value of each predictor.

Conclusions and Implications

The paper has developed and tested a parsimonious model of how aggregated ethnic group members' calculations of occupational mobility, the variable theorists generally agree to be most powerful in explaining ethnic assertiveness worldwide, combines with concrete inducements and disincentives to continued allegiance to the existing state leads to separatist outcomes. Regression analysis shows the extent the Future Mobility Model explains the extent of secession in the full domain of 15 cases in a particular universe, which allows a number of confounding factors to be ruled out as explanations of the variation. The large number of cases in the former Soviet Union present opportunities for controlled comparisons with a number of variables held constant. The project should thus suggest how occupational mobility concerns and alternative development trajectories are evaluated by ethnic group members and their collectivities, and where the FMM fails to capture the dynamics of secession or a lack of separatism.

Previous works on secession frequently are untestable or untested. Many frameworks fail or explicitly refuse to propose hypotheses and are thus unfalsifiable. Other approaches only vaguely specify the variables involved and rather than testing the propositions against an unbiased selection of cases, instead assess the experience in an ad hoc manner of a number of cases, selected through some unrevealed process. This paper attempts to rectify these methodological flaws. The study examines how some ethnic groups have incentives to autonomously limit secessionist aims and how other groups can be bought off through economic subsidization. Such subsidization, however, has only small effects on highly urban ethnic groups who require other regions available for emigration to reduce ethnic mobility pressures within their titular area. These groups are already biased against secession as long as they continue to export urban populations to other regions. On the other hand, the calculations of less urban ethnic groups, those whose national areas are net importers of urban residents from other ethnic groups, are biased in favor of secession, unless subsidization makes the existing relationship attractive compared to full independence.

The Future Mobility Model should also have broader application. Ethnic group calculations on secession in other cases appear to be captured by the scheme. For example, Bengalis in East Pakistan were not only urban importers, disadvantaged in employment vis-a-vis West Pakistanis, but the region was also exploited. Jute export earnings were expropriated by the government in Islamabad rather than returned to the devastatingly poor region. Thus secession was strongly sought and attained. The "velvet divorce" of Czechoslovakia also seems informed by this model. The urban population importer, Slovakia, was subsidized but subsidization collapsed with marketization and economic reform. Without subsidies as incentives to maintain ties with the Czechs, secession seems likely since minority preference hiring policies would expand Slovak occupational mobility under independence that would be proscribed under federation. One limitation to extension of the model is presented in the Soviet cases. The collapse of the central state reduced central resistance to separatism while most states worldwide retain robust sanctions and strong incentives to retain ethnic minority regions. Thus the model may better inform minority aspirations rather than results in other cases.

Other cases offer contrasting results for the model. The model implies that Eritrean and Tigrean separatist forces, which decisively defeated and took over the Ethiopian state in 1991 after over twenty years of armed struggle for full independence, might opt for autonomy within Ethiopia. Their role in government in Addis Abba offered additional mobility channels and their regional position on the periphery of the state presents possibilities for attaining development funds

through their intermediary role between the world economy and the hinterland.[78] A change of regime and government economic policies could alter ethnic group preferences, especially within internally divided groups.[79] Eritreans, and presumably their Tigrean and Oromo allies, could have tried to become exporter rather than importer groups and use their control of the state to subsidize rather than exploit their regions. This logically would produce corresponding changes in ethnic group preferences on separatism. Nevertheless, Eritreans voted overwhelmingly for independence in a September referendum.

The hypotheses also address how interethnic, interregional, and interstate relations are developing in the former republics as independent states. Concentrated ethnic minority populations within the newly independent states now agitate for increased prerogatives. Areas ranging from Gorno-Badakhshan, the former autonomous republic that is the least developed area of the least developed republic, Tajikistan, to modern areas of Russia, such as Tatarstan, have moved toward secession. On the other hand, efforts to maintain interrepublican ties as interstate relationships continue since urban exporter groups seek to maintain ties with urban importer regions and subsidized regions hope to retain sources of development funding. Thus, some "Commonwealth of Independent States" or "Economic Union" may be survive. The Future Mobility Model predicts which ethnic groups seek stronger and weaker ties with the post-Soviet associations and measures the commonwealth can take to increase cohesion. As concrete examples, the model expects Belarus' and Armenia to be strong supporters of the Commonwealth, with Russia also a strong backer. To the extent that subsidization drops out of common policies, Russia will be more supportive of the association, but previously subsidized regions such as Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan, attracted to ties with more developed regions precisely for subsidization, will be less supportive of the commonwealth. As the model expects, the Baltic states and Azerbaijan, where titular urbanites seek mobility opportunities through replacing immigrant urban populations and a legacy of exploitation leads to fears that this unfavorable economic relationship will be perpetuated in any continued association, have rejected the Commonwealth.

International actors interested in controlling the dissolution of the USSR can also manage the process through encouraging association. Association can be encouraged in two ways; first, by providing sources of funds for development to maintain some subsidization of less developed regions without exploiting of other regions, and second, by emphasizing the protection of minority rights within now sovereign national areas as conditions for international aid and diplomatic recognition. Providing some subsidization through the Commonwealth, with funds from the European Bank for Reconstruction and Development, World Bank, and International Monetary Fund, would maintain subsidization as a reason for continued association membership without driving other ethnic groups to opposition by exploiting their resources. Emphasizing minority rights, as part of human rights, inhibits importers of urban populations from drastically discriminating against different ethnic urbanites in their efforts to expand titular group mobility. Withholding full status as a member of the world community can act as a powerful lever to slow redistributive pressures on occupational mobility opportunities in new states. Integration into the world economy offers possible new opportunities for economic development and new mobility potential, perhaps without redistribution of posts in the economy. Such a two-fold strategy makes the process of secession more gradual and less conflictual, with reduced possibilities of nuclear contagion. Thus some similar policy is also in American foreign policy interest. Even acting alone can probably have strong effects. Some unilateral use of funds, opening of markets, and limiting international recognition on human rights grounds offers the United States opportunities to influence the process of association and separation.

Abstract

This article considers the requirement for - but dilemmas in - health screening of Presidential candidates. It surveys the experience the United States has had since 1931 with the health of candidates for the presidency, especially those who have been elected. The tripartite role of the president--as chief executive, as party leader, and as national symbol/model--is stressed. Several instances of deception, or at least lack of candor, are described. The dynamics of the process are reviewed, as are the advantages and inherent problems of corrective measures.

Special thanks to Bennett H. Bratt of the Department of Political Science, Tulane University.

CHOOSING A HEALTHY PRESIDENT

President Clinton, as chief executive, proposes legislation, carries on foreign affairs, and administers the federal bureaucracy. He is, moreover, leader of the Democratic party, with responsibility for seeing to it that its candidates are elected and its programs advanced. Of particular importance is his role as chief of state, as the symbolic embodiment of his nation's leadership. Health screening of presidential candidates is profoundly affected by the fact that every president must fill these three sometimes complementary, but often contradictory, roles.

Almost every other country separates these functions. No other country combines them with the intensity as does the United States. Unlike constitutional monarchies, where the symbolic function of chief of state is vested in the king or queeen and is separated from that of the Prime Minister, who serves as chief of government, this fusion of roles places a special burden on the symbolic function of the President. Americans going to the polls to elect a president are aware of this combination of governmental power, political leadership, and symbolic potency.

Issues of candidate health, physical and mental, are evaluated in terms of what the public knows the president will not only have to do, but also have to be. For the President is

expected to be all wise, all powerful, the repository of his followers' hopes and dreams, without human imperfections and frailties.

For the most part, analyses of health screening have only looked at the role that health plays or should play in selecting the president as chief executive. This is an appropriate limitation from one point of view. Considering the candidate as prospective party leader, the political parties (assuming, as one could not in the Perot candidacy, that there is a party) perhaps could look after their own interests. In regard to the candidate as prospective national symbol and model, it would make little sense to pass a law attempting to assure the public of an appropriate object of symbolic identification.

These three roles, nevertheless, interact, and any understanding--much less the generation of any set of reforms--must consider all three functions.

We are not sure that the time is ripe for remedies, or that remedies are needed. There has been little specific research on this topic, and what has been done by scholars has excluded the involvement of candidates who have faced this problem, doctors who have cared for candidates, and journalists who have covered campaigns.

We also base this essay on four assumptions:

(1) Presidents need not be perfectly healthy to function effectively in the oval office. That Franklin Delano Roosevelt had a physical disability secondary to poliomyelitis did not

impair his leadership and decisionmaking. The issue is not one of health per se, but the degree to which the requirements of presidential leadershup are impaired by the health condition. And Presidents and Presidential candidates can suffer acute illnesses and recover from them and function with full effectiveness. Consider the major heart attack (myocardial infarction) which Lyndon Johnson suffered while a Senator, the mulitple illnesses which punctuated Eisenhower's presidency: heart attack, stroke and ileitis. Even if there is some impairment, it might well be that voters may prefer, with good reason, Candidate A with some health problems to Candidate B well.

(2) We assume the public is as capable of evaluating medical information, including the disputes that may develop between groups of medical experts, as of any other type of scientific material. After all, the public is expected to evaluate controversial environmental issues such as global warming and nuclear waste disposal as well as complex and technical social issues such as macroeconomic policies and types of welfare policies. (Nelkin, 1982) While we believe that the public is capable of evaluating, and expected to evaluate, such information, we also acknowledge that the public often does so incompletely and half-heartedly.

(3) We assume that the more fully the public is informed, and the more the manner in which the information is presented, the better the quality of the public decision-making.

(4) We assume that privacy rights are conditional upon the nature of the occupation. That is, they are conditional upon the prospects for one's medical condition adversely affecting others. Just as an airline pilot loses some privacy rights as a condition of his occupation, or that a person must give up some medical privacy rights as a condition of securing an insurance policy or even a driver's license, so we suggest it is reasonable that anyone seeking the presidency would be subject to inquiries that most others need not answer. But whether a public role requires or should require giving up all personal privacy is debatable.

THE PRESENT SITUATION

There is no law that requires any type of revelation of candidate health, nor is there any legal penalty for candidate deception.

Screening takes place in three ways.

First, there is in almost all cases the campaign itself. British legislators stand for office, Americans run for office. Anyone who has ever been involved in a political campaign in the United States knows how demanding it is on everyone's, especially the candidate's, physical and mental well being. Campaigns, in this sense, are a combination of hazing, boot camp, and the Spanish Inquisition, often lasting two or three years. The degree to which the ability to withstand the rigors of a campaign meaures the candidate's fitness to occupy the oval office is

debatable, but campaigns surely are a test of stamina and the capacity to withstand sustained stress. Reactions to stress or fatigue occur in the face of such pressure, and can have catastrophic political consequences. For example, Senator Edmund Muskie of Maine, who sought the Democratic nomination for the presidency in 1972, was effectively thrown out of the race due to his tearful response to a press attack on his wife. (see Asbell, 1978, pp.287-288 for a good discussion of the event.)

Secondly, candidates are generally screened by political insiders, those who will be supplying the financial and other resources to the campaign. The "is-there-anything-we-should-know-now?" question is a very common one at the early stages of a candidate's search for partisan support, especially in the wake of the revelation during the 1972 campaign that George McGovern's running mate, Senator Thomas Eagleton, had been treated with electro-convulsive therapy 12 years earlier for a depressive illness. The revelation - and Eagleton's forced withdrawl in the face of the public reaction - threw the race into a turmoil. Also, gossip and rumors play a large role in the political selection process. Health matters, however, are likely to present special problems. People often are in denial concerning their health, especially regarding psychiatric problems or substance abuse. Because a person may believe his health is a purely personal matter, he or she may feel justified in being less than candid. As we will see in the case of Senator Eagleton, specific inquiries by McGovern's political aides were

not adequate.

The third, and most common, way in which candidates are screened is through investigation by the media. It is a great aid to a journalist's reputation if he or she can discover an important hitherto unknown fact about any candidate. For the most part such revelations are achieved through the following up of tips and rumors. Major health problems touch the lives of people other than the victim. Symptoms are likely to appear in public, or at least in view of more than intimates. Treatment inevitably involves not only physicians, but nurses, nurses aides, appointment secretaries and many others. People will talk, and word will get around. Health screening (which applies to candidates) is apt to be more successful than health monitoring (which applies to incumbents), because illnesses are often long standing, and appear and are treated before the candidate can call upon the insulation that high office often provides. The change in journalistic fashion ushered in by the investigative journalism of Watergate no longer respects the privacy of the candidate, in terms of health and personal relationships, which earlier had been the custom.

The media is the most effective means we have of health screening. Even if the candidate's opponents discover information, they are unlikely to release it directly, but rather give it to a sympathetic (and grateful) reporter to develop and disclose. The very fact that the media may discover an otherwise hidden health problem serves as a deterrent to its concealment.

Yet, as the case of Paul Tsongas makes clear, the fact or severity of illness can be successfully concealed or obscured, even
in this most open of societies with a tradition of vigorous media scrutiny.

HOW WELL HAS THE PRESENT SYSTEM WORKED?

The table below, which considers only the health status of the winning candidate, can assist us in answering this question. We have confined our examination to the modern presidency, which most scholars agree began with Franklin Roosevelt's administration.

Table I

Significant Health Conditions Not Generally Known
To Voting Public Before the President's Election

President and Term	Health Condition
Roosevelt	
1932	None. [Post polio paralysis of lower extremities known to voting public.]
1936	None.
1940	Arteriosclerosis and chronic obstructive pulmonary disease with substantial effect on stamina and episodic interference with quality of cognition.
1944	Arteriosclerosis, chronic obstructive pulmonary disease, severe hypertension and congestive heart failure, with frequent disabling effect on stamina and frequent interference with quality of cognition. Likelihood of death or incapacitating disability before end of term.
Truman	
1948	None
Eisenhower	
1952	Hypertension. Two probable heart attacks.
1956	Hypertension, history of severe myocardial infarction (publicly reported but medically downgraded). Reasonable prospect of death or prolonged disability during term.
Kennedy	
1960	Addison's disease. Treatment with cortisone and other drugs having dangerous psychoactive properties.
Johnson	
1964	None. Had major myocardial infarction, but fully reported.

Nixon

1968 None

1972 None

Carter

1976 None

Reagan

1980 None

1984 Degree of incapcitation following assasination attempt minimized. Indication of possible cancer of the colon, which was not properly investigated until after the election, whereas standard medical practice suggested more aggressive procedures before the election.

Bush

1988 None

Clinton

1992 None

Note that this table only considers physical or prescribed drug-related problems. Mental problems and substance abuse are apt to be more consequential, but more difficult to evaluate in health screening. We will address that issue later in the essay. Also note that recent candidates seem to be healthier than earlier candidates. This may be partially true given advances in treatment, technology, etc. For example, Clinton probably received a polio vaccine as a child, while Roosevelt certainly did not. Also, life expectency has increased over this time. On the other hand, news of medical problems tends to surface years, even decades, after a president leaves office, often only after his death. As of this writing, the five most recent presidents are still alive.

And, finally, we are only looking at the health of the winners in each election. What do we know about the health of Ross Perot, for example, who refused to give out any information on his health? Also, the table does not consider Vice Presidential candidates (such as Thomas Eagleton) or candidates for the nomination (such as Paul Tsongas).

Just using the table, starting with Roosevelt, we can see that the public has unknowingly chosen a president with dangerous health problems four times in the past sixteen elections. The public was not informed as to Roosevelt's failing health in 1944. The result was a president who was often ineffective. Roosevelt's death in office resulted in the succession to office

of Harry Truman, who is generally agreed to have been a good president, but who was not really chosen for that post. Had the public been as well informed as to Roosevelt's health in 1944 as those close to him were, popular pressure would likely have forced him to step aside in favor of another candidate. Perhaps that person would have been Truman, but perhaps not. Herbert Brownell, who later became Attorney General under Eisenhower, commented years later that Thomas Dewey, who did well against Roosevelt in 1944, could have won had they revealed how sick Roosevelt was. Brownell advocated doing so, but Dewey refused. "He thought it would be unpatriotic in the midst of the war." (Ferrell, 1992, p.60)

Eisenhower, as Robert Ferrell (1992) and Robert Gilbert (1992) have demonstrated, was a far sicker president than was realized at the time, though he coped with his illnesses well. Were there indications of these illnesses before the 1952 and the 1956 elections? In 1951 Eisenhower had a dangerously elevated blood pressure (sharing this pattern with much of his family), a history of heavy smoking, and a Type A lifestyle. He had probably experienced heart attacks on January 21, 1947 and on March 21, 1949 (Ferrell, 1992, 63-66). This information foreshadowed his later heart disease and stroke. Knowing this medical history in 1952, would the public still have chosen him over Adlai Stevenson? But, under conditions of adequate health reporting, the public would have known more about Stevenson's health as well. We can not comment to the same degree about

Stevenson's health condition. Because Stevenson was not elected, we know far less about his health than about Eisenhower's.

Kennedy misled the public about his adrenal insufficiency during the campaign. He and his campaign staff believed that the issue would have hurt him, and they were probably right. Kennedy's hairline victory in 1960 might easily have been a hairline defeat. Russell Baker, a journalist who had covered Kennedy in 1960, noted that "A statement like that [that Kennedy suffered from (Addison's disease), a chronic life-threatening disease requiring potentially psychoactive medication] would have been fatal to his campaign." (quoted in Altman, October 6, 1992) Because Kennedy was assassinated so early in his term, we cannot evaluate the effect that the disease and the side effects of the powerful adrenal steroid treament he was receiving would have had on his leadership and decisonmakming.

All the evidence we have reviewed indicates that Nixon was healthy in 1960 and continued so for over four years. The famous television debate, in which Nixon appeared listless in comparison to Kennedy's vigor, was due to Nixon's incomplete recovery from a painful knee injury and associated infection. As far as health and vigor went, the television camera lied.

Of the remaining presidents, we have little information that they had medically relevant disorders that were not generally known. The only instance is perhaps Ronald Reagan. In May of 1984, less than six months before the 1984 election, a small, benign, inflammatory fibrous polyp was removed from Reagan's

descending colon. (Gilbert, 1992, p.199) Although harmless in itself, this discovery should have immediately led to a full examination of the ascending colon. Indeed, in the following year a cancer was found in this area. The size and nature of this second cancer indicated that it was present in May, 1984. There are two possibilities as to why the physicians did not take a second colonoscopy in 1984:

(1) They did not want to disturb their patient with another procedure; (2) The president and his advisers told them not to. They did not want the public to be reminded of Reagan's age by having a second (well-reported) procedure performed. Reagan and his advisers may have been afraid that cancerous tissue would be found, as did in fact happen later and almost surely would have occurred in May of 1984. An announcement in May of 1984 that Reagan had cancer of the colon (which would then have been followed by immediate surgery) could very well have cost him the election. (Ferrell, 1992, 158).

Were there medical coverups regarding Clinton and Bush in 1992? Perhaps not, but it is notable that Bush was not nearly so open concerning his health in 1992 as in 1988 and that Clinton released minimal information and refused to be interviewed about his health. The Clinton campaign attitude was well reported by Robert Steinbrook of the Los Angeles Times:

> "At the governor's instructions," Clinton's physicians do "not talk to the press," said Avis LaVelle, a Clinton spokeswoman. When asked why, LaVelle said, "People have reason to be concerned about President Bush's health. There is no reason to be concerned about Governor Clinton's health."

(Steinbrook, 1992, p.A18)

The Perot campaign was even less forthcoming. A Perot spokeswoman said she did not know who his physician was. No health information was released by Perot or his staff. (Steinbrook, 1992, p.A18) Even the New York Times medical correspondent, Dr. Lawrence Altman, had assumed too much in the April before the nomination when he wrote that "...it has become standard practice for political leaders to waive the confidentiality of the patient-doctor relationship and to disclose their health records fully." (Altman, April 28, 1992)

Controversy about the presence and accuracy of health records is not new. The first presidential candidate who presented a health report was Franklin Delano Roosevelt in 1931. The event was a mixture of candor and deception. Roosevelt claimed that he was submitting to an examination in response to a challenge put forth in the July 25, 1931, issue of Liberty magagazine by the ostensibly Republican journalist Earle Looker. In fact, the "challenge" had been arranged by the Roosevelt staff, and Looker later ghost-wrote a series of articles under Roosevelt's name for Liberty. (Winfield, 1990,p. 20; also see Morgan,p. 336-337; Gallagher, 1985, pp. 84-85; and Davis, 1985, p.220) The Director of the New York Academy of Medicine chose three physicians: Russell A. Hibbs, an orthopedist; Foster Kennedy, a neurologist, and Samuel W. Lambert, a diagnostician. The report was unexceptional, noting accurately that "[Roosevelt's] powers of endurance are such as to allow him to

meet all demands of private or public life." (as quoted in McIntire and Creel, 1946, p.54)

The report was misleading at some other points, however, in that it stated "There has been progressive recovery of power in the legs [in the ten years since he was stricken with polio]; this restoration continues and will continue. Governor Roosevelt can walk all necessary distances and can maintain a standing position without fatigue." (as quoted in McIntire and Creel, 1946, p.54) The doctors must have known that Roosevelt could not walk by any common definition of the term and his legs would never recover. Standing was always difficult for him and would rapidly become painful. The principal author of the book from which these quotations were taken is Ross McIntire, Roosevelt's personal physician during the second World War, who deceived not only Roosevelt and his family but the public as well concerning the severity and prognosis of Roosevelt's health problems.

Another case of a candidate's medical deception concerns Senator Hubert H.Humphrey of Minnesotta. In 1973 Humphrey, who had run unsuccessfully for the presidency in 1968, was told by his personal physician Edgar Berman that he had cancer of the bladder. The fact of the illness was not hidden from the public during eight weeks of extremely painful X-ray therapy, ending in December 1973. In April 1974 his doctor said that the tumor had disappeared, "destroyed by the treatment last winter." (quoted in Solberg, 1984, p.449) Berman referred to the disorder as "dysplasia," or "an abnormality of the cells of the bladder

lining," though other doctors called it cancer or carcinoma. (Cohn, April 9, 1976, pp. A1,A6).

Humphrey made himself available for the 1976 presidential nomination, but did not campaign, apparently hoping that Scoop Jackson, George Wallace, and Jimmy Carter would come to a deadlock. When Humphrey was asked about his health, it was reported that "he considers himself cured of any disease and that if he weren't healthy he would not be a candidate for any major office." (Cohn, April 7, 1976). Peter Milius of the Washington Post, however, reported that Humphrey had "carcinoma in situ" since 1968 (!), but did not indicate that he would withdraw from the race for health reasons.

Carter gained momentum, however, and it became evident that unless Humphrey entered the race and defeated Carter in the New Jersey primary the former governor of Georgia would have effectively secured the Democratic nomination. But just before the filing deadline Humphrey announced that he would not run. He said that he lacked organization and funds, and that his continued candidacy would probably divide the party and so give the election to Ford. He made no mention of health considerations in his announcement, though his biographer, Solberg, suggests they played a role in his decision. (Solberg, 1984, p.453) Humphrey did say that he would run for the Senate. In May, about a month after this announcement, his office announced that Humphrey "showed no evidence of disease," and "planned no further treatment," (Humphrey Passes...). Humphrey

easily swept the Minnesota senatorial Democratic primary in September. Later that month, however, he was diagnosed with invasive cancer and had to undergo extensive surgery. He nevertheless won the election in November. (Solberg, 1984,p.453)

Humphrey apparently deceived the public regarding his cancer during the 1975-76 Democratic presidential primary campaign, as well as during the subsequent Minnesota Democratic primary (though Minnesota's electors later chose him knowing of his cancer). It is notable that he did not mention health as a reason for pulling out of the presidential contest. Of all the reasons he might have given, that reason alone might have damaged his prospects for the senatorial nomination.

Had Humphrey won the presidential nomination, he would have been stricken in the midst of the presidential campaign. Carter barely defeated Ford, but it seems likely that Humphrey's cancer surgery, with an uncertain prognosis, would have dealt a fatal blow to his campaign.

We have seen that the press has been an inconsistent guardian of the public's interest in revealing health problems among candidates. The press colluded with the Roosevelt administration in hiding his dependence on crutches and wheelchairs, and, of much greater consequence, in not revealing the extent of his deteriorating health in 1944. Kennedy's Addison's Disease and its medical consequences were poorly reported, and his amphetamine abuse while president only was revealed in the press years after his assassination.

Indeed, at least in the past, some problems, such as alcoholism, were not reported at all, witness this report filed years after the event:

> Though the room was darkened Earl [Mazo, a campaign reporter] recognized Kefauver lying on his back, flat out on top of the bedspread, completely naked, sleeping the sleep of the dead. Dick Wallace [a campaign aide] filled a glass almost to the top with straight Scotch whisky, carried it to the bed, and touched Kefauver's shoulder, saying, "Senator, it's time to get up."
>
> Kefauver began to rise stiffly. As he came toward the full sitting position, one arm rose as though grasping for something to pull himself up with. Wallace put the glass of whisky in the outstretched hand, and Kefauver brought it to his lips and drained it.
>
> (Baker, 1989, pp.304,305)

Kefauver failed in his bid for the White House, defeated for the democratic nomination by John F. Kennedy. But information on his alcohol dependence did not figure in that defeat. As we have seen, the deceptions surrounding the nature of Kennedy's adrenal insufficiency and the potentially psychoactive drugs involved in its treatment were not investigated by the press. (Ferrell, 1992, 151-157; Gilbert, 1992, 154-159, 165-170; Rensberger, 1972, pp.1ff)

Does deception concerning health take place among aspirants to the presidency? Yes it does. Is it successful? Sometimes. Is it very common? Not too common, but not rare either. Is it generally reported? Generally, but not always.

The next question is, does it matter?

HAVE UNDISCLOSED MEDICAL PROBLEMS PRESENT DURING THE CAMPAIGN AFFECTED THE CONDUCT OF THE PRESIDENCY?

There is by now a very large literature (Ferrell, 1992; Gilbert, 1992; L'Etang, 1969, 1980; Park, 1986; Post and Robins, 1993) demonstrating what should have always been obvious but which was often ignored: Presidents and other heads of government have been secretly sick in office, and their sickness and the deception associated with that sickness have affected the quality of their performances. In some cases illness first appeared with little or no warning while its victim was in office (Woodrow Wilson's stroke, Nixon's phlebitis, Coolidge's depression, Bush's Grave's disease). But in others, as we have just seen, there was warning to the candidate and to his inner circle, but not to the public.

Roosevelt was often incapacitated during his last term from a plethora of serious illnesses affecting multiple body systems. His incapacity was evident before the election but was concealed and denied. He was often an ineffective leader during that term and died before its completion, leaving a vice president unfamiliar with foreign policy to carry on his duties. Eisenhower was also disabled for two substantial periods of time by illnesses that had clearly cast their shadows before them: cardiac problems and stroke. Kennedy's deceptions were made irrelevant by his assassination, and Reagan's cancer of the colon turned out not to be disabling.

The answer to the question heading this section is clearly in the affirmative. Medical deception during a campaign has been a factor in permitting the election of a person likely to be disabled, and in two cases disability has occurred.

HAVE POLITICAL PARTIES AND FACTIONS WITHIN PARTIES BEEN DAMAGED BY MEDICAL COVERUPS?

A secondary potential consequence of concealed candidate health problems is damage to the party and its programs, for the defeat of the party or faction is generally equivalent to the defeat of its program.

A sudden revelation that a candidate has what might become a disabling condition can change the direction of an election. The candidate can then be eliminated, often leaving his followers excluded as well. It may be appropriate that the candidate, perhaps medically unsuited for the position, lose the election. With that loss, however, he will drag down many others and damage the prospects of a program that otherwise might have been enacted.

Two instances involving the presidency suggest this. The best known and best documented was the nomination, and subsequently the forced withdrawal, of Senator Thomas Eagleton of Missouri, George McGovern's running mate in 1972.

George McGovern came to the forefront of the Democratic contenders after his primary rival, Edmund Muskie, electorally

wounded himself in the wake of the "crying episode" mentioned above. That is, McGovern was aided by his principal opponent being disqualified because of what the public believed to be a serious psychological flaw.

McGovern did not start on a concentrated search for a running mate until after he was nominated, at which time he and his staff were exhausted (Theodore White, 1973, pp.203-229). McGovern considered a number of persons for the vice presidential candidacy: Governor Ruben Askew of Florida, Senator Abraham Ribicoff of Connecticut, Senator Edward Kennedy of Massachusetts, Senator Walter Mondale of Minnesota, Senator Gaylord Nelson of Wisconsin, Mayor Kevin White of Boston, President Leonard Woodcock of the United Auto Workers and Senator Thomas Eagleton of Missouri. Mondale, Nelson and Eagleton were on the short list presented to McGovern only hours before he was scheduled to make his nomination to the convention. Mondale refused the offer, but recommended Eagleton. Nelson, who was a close friend of McGovern's was next approached. He too declined, but also recommended Eagleton. Further consultation took place against the rapidly approaching deadline.

McGovern finally called Eagleton, who immediately accepted, and who was rapidly turned over to McGovern aide Frank Mankiewicz. Mankiewicz asked Eagleton if he had anything that might come out and embarrass the campaign. Eagleton said no. There was, however, no specific inquiry about health matters.

In less than two weeks, however, Eagleton announced to a

press conference that over the past twelve years he had been hospitalized three times for psychological reasons, had received psychological counselling, and had received two electroconvulsive shock treatments. As later noted in the press, Eagleton's mental health problems, though not widely publicized, were common knowledge in political circles in Missouri.

The announcement led to Eagleton's removal from the ticket and the loss of any hope the Democrats had of defeating Nixon. It also damaged the image of the national Democratic Party.

Mental illness in the chief of state, with the perception of the leader in whom we vest so much, unable to decide, emotionally out of control, much more than physical illness, invokes a feeling of dread in the public. Willard Gaylin, psychiatrist and medical ethicist, (1973) wrote a perceptive evaluation in the wake of the Eagleton affair of the public's view of mental illness among candidates. He noted that the public has come to accept the modern idea that mental illness is not likely to be something that one has, like a cold, but rather something that is part of the whole personality. The public, therefore, is less likely to assume that a defect has been eliminated.

When Eagleton was challenged for not promptly revealing his mental health hospitalizations, he stated that "My health just wasn't on my mind, it wasn't on my mind, it was like a broken leg that healed." (White, 1972, p.210; also see "A Crisis...," 1972, p.19)) The public will not accept such an analogy. They believe, not unreasonably, that a history of severe depression is

more likely to reappear, even after apparently successful therapy, than a healed broken leg is likely to re-break. A broken leg, moreover, is far less likely to affect the ability of a president to function as president than severe and chronic depression.

While many would assert that a willingness to seek psychotherapeutic treatment during a period of psychological stress, such as that attending a difficult divorce or the death of a family member, is a sign of maturity and wisdom, unfortunately the stigma associated with psychiatric treatment is so deep and pervasive in the public mind that the fact that such treatment was needed is seen as a sign of weakness and instability sufficient to disqualify the candidate. Consider the 1988 race, when the rumor that Governor Dukakis had sought psychological counselling during a low period in his life marked by the death by suicide of his brother and his loss of the governorship. President Reagan sarcastically called Dukakis "an invalid." Dukakis, in effect, had to defend against against this accusation. If this is true of outpatient counselling, a history of psychiatric hospitalization is seen as a major flaw in the candidate, representing weakness, unreliability, inability to deal with pressure. The public does not want to identify with a flawed candidate, nor does it want to trust the nation's stewardship to such a person.

An unfortunate consequence of this persistent stigmatization of mental illness is that individuals in public life who may well

benefit from counselling during periods of personal stress may choose to forgo this assistance rather than damage their political prospects.

It is important to note that the public makes a distinction between the presidency and other offices. Eagleton was re-elected to the Senate after this episode, with little controversy. Another illustration that the public is more likely to distinguish between presidential and other candidates is that of Lawton Chiles of Florida, who resigned from the Senate in 1988 after three terms due to depression, insomnia, and lack of appetite. After taking Prozac, an anti-depressant, he re-entered politics in 1990 and, in an election in which his medical fitness was debated, was elected governor of his state. (Lawrence, 1990) An even more recent and dramatic example of the public choosing to elect a very ill legislator is that of U.S. Representative Paul Henry of Michigan's Third Congressional District. On October 21, 1992, just weeks before the election, Henry's staff announced that he had just undergone surgery to remove a three-inch malignant tumor from the right frontal lobe of his brain. As the Grand Rapids Press noted, "Despite concern about his medical status, Henry, 50, was easily elected to a fifth term..." (Roelofs, January 26, 1993). The voting public of Grand Rapids clearly preferred a very ill Republican to a well Democrat.

The presidency is, however, the office that attracts the most intense reporting and has the highests saliance for the public. It is also the one, witness Eagleton, where the

temptation toward deception is greatest. The most recent incident of apparent public deception concerns former Senator of Massachusetts Paul Tsongas' health during his quest for the 1992 Democratic presidential nomination.

In 1983 Senator Tsongas was diagnosed with cancer, "non-Hodgkin's lymphoma, nodular and diffuse, poorly differentiated lymphocytic type, or small cleaved follicular center cell type." (Altman, April 28, 1992.) Because of its poor response to cancer chemotherapy, in 1986 he received a bone marrow transplant at the Dana Farber Cancer Center, at the time a highly experimental treatment undertaken because the tumor was not responding to more conventional treatment. When Tsongas entered the race, he confronted the issue of his cancer. He asserted that as a consequence of the bone marrow transplant, he was cured and that his health prospects were as good as if he had never been ill. His doctors supported him in the efficacy of his treatment and his excellent prognosis. Televison ads featuring him vigorously swimmning the butterfly in a Speedo bathing suit were featured prominently in the campaign. Tsongas won the key New Hampshire primary. The public was impressed with his bravery and his candor.

In fact, he and his doctors were by no means candid, for they had concealed the fact that the transplant had not resulted in a cure, for the cancer had recurred in 1987, requiring the removal of a cancerous node. Rather than acknowledging the recurrence Tsongas's doctors used ambiguous and evasive language:

"suspicious cells" were what the cancer was called and the attendant radiation was described as precautionary. (Altman, April 28, 1992, p.B,6). With reference to his claims to be free of cancer, Tsongas later wrote that his doctors gave him the "facts" at that time. (Tsongas, May 6, 1992) Only in April of 1992, well after Tsongas was no longer seeking the nomination, did the doctors disclose the recurrence, which, of course, made Tsongas' prognosis much more pessimistic.

In fact, Tsongas suffered a serious recurrence in Decmeber of 1992, requiring an extensive course of chemotherapy in January, 1993, during which Tsongas lost his hair and suffered serious weight loss.

Tsongas did not lose the nomination due to health problems, but in fact his victory in the New Hampshire primary had a significant effect upon the unfolding dynamics of the campaign. Had he suffered the recurrence before the New Hampshire primary, or had the gravity of his prognosis not been concealed, leading to the withdrawal from the race or loss of the primary, the whole course of the primary campaign would have been changed.

Had he been nominated, and had the recurrence occurred in October, or had the fact of the recurrence come to light, revealing Tsongas' duplicity, the health issue, combined with the candor issue, would almost certainly have cost the Democrats the election. Had he been elected, he would have been undergoing chemotherapy during the first month of his term. In a remarkable interview on NBC televison, when asked what the impact on the

nation would have been had he rather than Clinton been elected, Tsongas shrugged his shoulders and replied, "The country would have had a president with cancer."

Candidate's doctors, like president's doctors, have followed the practice of putting not only their patient's medical health but also their patient's political health ahead of other considerations. The kindest comment on Tsongas' doctors' reportage on their patient came from Dr. Robert J. Mayer, a member of the committee from the Dana-Farber Clinic that had written an evaluatory (but unreleased) report on Tsongas' doctors' public statements: They were "people who were highly professional in one part of their lives who perhaps were amateurs in another." (Altman, January 17, 1993)

HOW HAS HEALTH AFFECTED THE ELECTORATE'S PSYCHOLOGICAL IDENTIFICATION WITH THE CANDIDATE?

Politics falls far short of being a completely rational process. Rightly or wrongly, people expect a president to represent not only their will and their interests, but also their innermost hopes about who they they are and what their country should be. This idealization, with a consequent intolerance for human imperfection, can assume irrational proportions, but this irrationality must be taken into account.

This idealization of the leader as model renders behavior that the public feels is undignified or embarassing particularly troubling. In the American political arena, significant alcohol

abuse will be tolerated in public officials, as long as it does not detract from their political role and public image. But when it leads to public humiliation, the fall from power can be precipitous, as exemplified by the powerful chairman of the House Ways and Means Committee Wilbur Mills.

Mills' heavy drinking was well known, but it was only when the news hit the headlines that the U.S. Park Police had found an intoxicated Mills cavorting in the early hours of the morning in the Tidal Basin with the Washington stripper Fanny Fox that Mills fell from power.

The greater the magnitude of idealization, the greater the magnitude of subsequent disillusion. The idealization of the public figure, especially the President, and the concomitant intolerance for imperfection, places a major premium on concealing flaws, including medical flaws, from public view. That candidates Roosevelt and Tsongas concealed the gravity of their medical conditions from public view is an expression of this tendency. However vigilant the press, however vigorous the opposition, it can be expected to continue unless clear steps are taken to counter it.

WHERE DO WE GO FROM HERE?

As we have taken pains to demonstrate, the revelation of an illness is very likely to damage the prospects of a candidate and his party, even though the illness itself may not adversely

affect leadership capacity. A political party therefore, should have a special interest, a self-interest, in the health screening of its candidates.

Society has a long-term interest in encouraging healthy candidates and discouraging unhealthy candidates. A number of remedies have been proposed, ranging from full or partial disclosure of medical records, to a comprehensive medical examination of candidates by a special panel. Each has strengths, but weaknesses too. We will briefly review the suggestions, observing both advantages and disadvantages.

Requiring appropriate disclosure clearly would decrease the chances for medically impaired persons from occupying the presidency. But what is appropriate?

The question of disclosure is comnplex. The advantage of full disclosure is that, if successful, it eliminates suspicion of hidden defects. Dr. Herbert Abrams, who has written widely on the ailing VIP, argues without reservation for full disclosure. To put oneself forward as candidate for the highest office requires, in his judgment, giving up the right to medical privacy. And, he argues further, the candidate's physician should be an active party to that full disclosure. We share with Abrams discomfort over the role of the physicians involved in Senator Tsongas' cancer treatment, who actively concealed and obscured the severity of his condition. Privilege rests with the patient, of course. Should an exception be made in the special circumstances of presidential candidacy? Should the doctor, with

the patient's permission, be available for interviews by medical and political journalists? Or should there be a written medical statement? Should all or some medical records be released? Dr. Larry Mohr, until recently White House physician, argues for preserving the doctor-patient relationship and medical confidentialty. He recommends a written statement with permission of the President (or candidate), but believes the physician should not be made available for interviews, nor should full medical records be available.

One of the hazards of full disclosure and requiring full participation of the physician is that the candidate might conceal from his own physician or might delay reporting symptoms or having tests for political reasons. A recent example concerns Governor William Casey of Pennsylvania, whose cardiologist has acknowledged Casey's regular cadiac evaluation was omitted in November of 1990 for fear that adverse findings concerning Casey's heart condition would leak and adversely affect his campaign. Another negative possibility is that candidates might secretly resort to inferior treatment. One of the problems with requiring full disclosure is that irrelevant, but potentially sensational, medical problems, such as sexual dysfunction, would be given disproportionate and embarassing coverage. A democratic system assumes that the public is able to deal with such controversy, a dubious assumption at best. As we have noted, the embarrassment and the risk of losing an election or a nomination because of such disclosures might lead candidates to avoid

medical care. The requirement for full disclosure also raises the privacy issue in such an extreme manner as to make it unlikely that any legislation would be passed.

Partial disclosure, on the other hand, avoids some of these difficulties. Consistent with the recommendation of Dr. Mohr concerning the manner for handling the President's health report, the candidate's physician, with the approval of the candidate, would release a written statement concenring the candidate's health, including reference to specific health problems and their treatment. For example, a report might read that "Candidate X has no serious health problems. He has suffered from mild hypertension since 1985, which is well controlled with a beta-blocker." An additional requirement might be to comment with reference to a specific list of conditions and medications determined beforehand and made public. Only these conditions and medications would be disclosed. This approach is analogous to screening for other professions. Individuals are denied insurance policies, not permitted to fly airplanes, or may not receive a driver's license because of specific conditions determined in advance. And physicians may not be licensed to practice if they are medically impaired. In particular, a broad spectrum of positions with public responsibility requires partial medical disclsoure as a condition for being able to occupy that role. It seems reasonable that the Presidency, a position with ultimate public reponsibility, should have similar requirements. Such a process would go far toward satisfying the disclosure requirement

while preserving the confidentiality of the doctor-patient relationship and maintaining privacy. This method would not be totally satisfactory--sometimes lesser pathologies in combination can imapair functioning--and some would not be satisified without full disclosure--but it would strike a balance that would addresss nearly all of the problems we have been discussing.

Another remedy which has been proposed is the establishment of a panel of physicians--governmentally or professionally selected-- having access to the candidate and his or her health records. Failure to cooperate would deny the candidate federal campaign aid.

Concerns have been raised concerning whether there is such a thing as medical objectivity. Quis custodes custodiet? Will the party affiliation of physicians affect the manner in which they evaluate the health status of candidates? Should the commission be bipartisan? One possibility is for the candidate's political party to nominate a panel from which the other party would choose members (Schattman, 1989). Another possibility is for the medical association to nominate a panel of physicians from which the candidate would choose.

In addition to the advantage to the voting public, another advantage of a comprehensive medical examination would be better disclosure to the candidate. Candidates as well as presidents sometimes receive poor medical care. Their doctors may be old friends or political associates, not necessarily the best physicians. Moreover, their medical judgment may be overcome by

their poliitical enthusiasm. Candidates' doctors may lack the courage to tell their high status patients unpleasant truths. They may fear that being the bearer of bad news will lead to their replacement and may be overaccommodating.

Candidates would, under such a system of mandated examinations, at least be properly informed as to their medical condition, danger of medications, lifestyle etc. (Robins and Rothschild, 1981, p.251) It would be a deterrent to bad medical practice if the candidate's doctors knew that their patient would be receiving an evaluation of their care.

But how comprehensive should a comprehnsive examination be? The earliest indications of Alzheimer's disease are subtle psychological changes, best identified by careful neuro-psychological testing. Should a broad range of psychological tests be administered, including intelligence measures and personality assessment? Should such results be reported? Should there be CAT-scans or other sophisticated neuro-radiologic examinations of the brain?

The questions are daunting, and it is clear that in the search for fully healthy candidates, one can erect such formidable health screening barricades as to discourage candidates who might function effectively in that office, thus depriving the public of their services.

If it is decided that there should be a system with legal sanctions concerning health screening of presidential candidates, then there is likely to be a secondary advantage. The rule would

apply to all running for office, not simply those running for the first time. In other words, presidents seeking a second term would have to submit to this screening as well as their challengers. There would be considerably less motivation for deception while in office--and their doctors would have considerably less leeway in violating good medical practice--if candidates knew that before they could run for office again they would have their medical history taken and relevant matters revealed to the public. Even the quality of medical treatment and the candor of medical disclosure of second term presidents (where the motivation for deception may be less than among first termers) might improve due to the higher standards imposed earlier on.

This paper has idenitifed that there is a significant and continuing problem in choosing healthy presidents. Remedies have been discussed. Perhaps the most useful step to implement at this time, as was done by the Miller Commission in considering the flaws in the 25th amendment, would be to establish a commission composed of physicians, lawyers, and historians, political scientists and practicing politicians to consider the best procedures for ensuring that we choose and elect healthy presidents.

for a mental ailment is a sign of maturity and wisdom, most would nevertheless regard the fact that such treatment was needed sufficient to disqualify the candidate. Hospitalization for a mental condition is seen as a blemish upon the patient. The public does not want to identify with a blemished candidate, nor does it want the nation represented by such a person.

REGIONAL PLANNING, PARTNERSHIP, AND THE CHANGING ROLE OF THE STATE: THE CASE OF QUEBEC'S NEW MENTAL HEALTH POLICY

David A. Rochefort
Department of Political Science
303 Meserve Hall
Northeastern University
Boston, Massachusetts 02115

Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, The Washington Hilton, September 2-5, 1993. Copyright by the American Political Science Association.

Culminating a process of several years, in which extensive professional and public consultation occurred, the Province of Quebec officially adopted its new mental health policy in January of 1989. The policy provides a major statement of the concept of mental health and the goals that should guide mental health service delivery, including the primacy of individual well-being and the enhancement of environmental supports. Most important from an operational standpoint, the measure created an innovative regional planning process for mental health care that is centered around the mechanism of a "partnership" among professional, consumer, and community actors.

At a time when fiscal concerns have preoccupied health care policymakers in other areas of Canada and throughout the Western world, diverting attention and resources away from the challenges of improving the mental health care system, Quebec's mental health policy constitutes an ambitious, far-reaching reform effort. Its component processes--reallocation of financing from institutional to community settings, decentralization of decisionmaking authority, and reconceptualization of the factors promoting mental well-being and quality service provision--could effect a fundamental transformation in the configuration of care. For these reasons, the policy commands notice, including a careful examination of its strategic underpinnings and subsequent implementation.

The purpose of this paper is to provide a preliminary analysis of Quebec's mental health policy. It is based on interviews with administrators, advocates, professionals, and planning participants in several regions, in addition to conversations with scholars interested in these developments. I have also relied on documents collected from public agencies, the academic literature, and newspaper reports. Research began in the winter of 1989, shortly after passage of the policy, and continued into the fall of 1992 with on-site research in Quebec City and Montreal. For the final stage of my research, I plan to travel to Hull for a determination of the policy's consequences in that region, which played a special role in the origination of the provincial policy.

The following pages briefly trace the historical development of Quebec's mental health system, leading up to the 1989 policy. I then underscore the significance of the policy from both practical and theoretical vantage points. The problems and possibilities of system reform as revealed in the policy's early implementation phase are examined, and I outline key research issues neeeding to be explored for a full evaluation of the new policy and its impacts. Finally, Quebec's initiative is discussed with respect to contemporary theories of the state.

THE MENTAL HEALTH SYSTEM OF QUEBEC

Like elsewhere in Canada and in the United States, prior to the 1960s Quebec's mental health system was oriented to care in large institutions, which numbered 17 and cared for some 22,000 patients by mid-20th century (Health and Welfare, 1990). Major facilities included Montreal's l'Hopital St-Jean-de-Dieu and Quebec City's l'Hopital St-Michel-Archange. Custodial care more than active therapy characterized the program of these huge establishments, as Boudreau (1980: 125) has summarized: "As with all such asylums, closed treatment, chronic overcrowding and understaffing, insufficient sanitary facilities, lack of personal attention and care, punitive attitudes, indefinite stays and dictatorial and autocratic management were

the rule."

Under the influence of drug advances, new treatment philosophies, and government reform activities such as the 1961 Bedard Report, the system was increasingly diversified during the 1960s. New sources of care in the general hospital and community settings began to appear, accompanied by growth of the psychiatric profession. Deinstitutionalization proceeded rapidly, resulting in a 40 percent decline in the number of long-term patients in psychiatric hospitals by the end of the 1970s. In the process, Quebec became a leader in "repatriating" patients to their home communities, with programs such as the one developed in Sherbrooke gaining attention elsewhere in the country.

Still other forces of change have reverberated through Quebec's mental health system in the 1980s and 1990s. These include growing consumer and family movements; recognition of the incomplete success of existing service structures, like the local community service centers (CLSCs), in improving access to care; an expanding knowldege base concerning the requisites of community support structures for the chronic mentally ill; a more global concept of mental health incorporating public health, as opposed to traditional medical, perspectives; and heightened concerns on the part of government with efficient management control of health care resources (Boudreau, 1980; White and Mercier, 1991). It is these complex currents, which pose a challenge to past clinical practices and allocation patterns within the mental health sector, that constitute the social and intellectual backdrop for the formulation of a new mental health policy by Quebec's Ministry of Health and Social Services in the late 1980s.

At the opening of the current decade, the main organizational elements of Quebec's public mental health system stood as follows: 19 psychiatric hospitals; 55 acute care hospitals with specialty psychiatric services; 156 CLSCs which offer basic mental health care; and over 100 community organizations, funded in part with provincial resources, that deliver a variety of mental health and supportive services (Health and Welfare, 1990; Harnois, 1987).

As a rough gauge of the severity of problems this programmatic network must address, a recent survey ranked mental disorders second of all health problems among Quebec residents. About 1 in 12 persons were affected, with higher prevalence among lower socioeconomic groups (Health and Welfare, 1990: 113; Quebec Ministry of Health and Social Services, Part One). Applying less strictly clinical definitions, levels of discernible disturbance in the province are much higher still. Recently, there has been an upsurge in the problem of suicide. Overall, it is estimated that only a relatively small minority of persons who experience mental health problems currently enter the system of care for treatment.

QUEBEC'S MENTAL HEALTH POLICY (JANUARY 16, 1989)

The mental health measure passed by Quebec on January 16, 1989 (Quebec Ministry of Health and Social Services, 1990) that is the focus of this paper has been described as the province's "first official, comprehensive, statement of mental health policy" (White and Mercier: 151). It is really three documents in one: a statement of principles, particular system objectives, and an implementing mechanism.

The policy begins by adopting a broad definition of the concept of mental health, emphasizing a "psycho-developmental axis" which asserts "the mental health of individuals can be appreciated in terms of their ability to make approrpiate use of their emotions when they act (affective component), to adjust their behavior to circumstances through reasoning (cognitive component), and to relate meaningfully to their environment (relational component)." Following from this definition, mental health policy must be concerned both with individuals who enter the treatment system and with the community at large, including the social, cultural, and economic factors that impinge on mental health status broadly considered.

The first of five complementary "goals and orientations" in the policy is a "focus on the individual." By this is meant the system should aim toward recognizing each person's unique needs, problems, abilities, and preferences, and preserve the rights that all share in common.

A second objective is to "enhance the quality of service provision" by concentrating on forms of care with proven efficacy and by working to develop creative new approaches that improve on past practices.

Third, Quebec's mental health policy accents equity, in terms of a broad range of services made available in every region. The distribution of human and financial resources should reflect population needs.

Fourth, the policy articulates a context-dependent vision of service development and deinstitutionalization. This feature specifies support system interventions that fit local community capabilities and encourage innovation at this same level.

The fifth goal is mobilization of a formal and informal partnership--consisting of, among others, professionals, consumers, family members, and community leaders--to plan and carry out mental health program activities.

Under each of these general goals, the policy delineates specific implementation activities. Key to maintaining the primacy of the individual, for example, is the formulation of "individual service plans" for all long-term patients in the system. Enhanced quality is seen to depend on better training, research, and evaluation. To promote equity, the mental health policy specifies an inventory of minimal or essential services belonging in every region and the use of new formulas at the provincial level to equalize distribution of regional funding. Provincial policy also gives new recognition, policymaking authority, and financial support to community-based organizations involved in delivering prevention, rehabilitation, and social reintegration services.

Finally, underpinning and interwoven throughout all of the above activities is the initiation of a new mental health planning process in which local bodies, the Regional Councils of Social Services (CRSSs), are charged with responsibility for conducting a comprehensive assessment of mental health system needs and the identification of appropriate responses consistent with this policy. The actual planning work is to be done by tripartite committees, formed by each CRSS and composed of representatives from health and social service establishments, mental health community

organizations, and other community and social groups. This planning process is the very linchpin in the concept of partnership on which the whole mental health policy depends and will receive primary attention in later sections of this paper.

THE POLICY'S SIGNIFICANCE

Quebec's mental health policy represents a public initiative of limited geographic scope in a country whose population places it among the smallest of Western industrialized nations. Even within Quebec, the mental health policy is but one of a number of reforms in the health care arena now underway following from the work of the Rochon Commission (Commission of Inquiry into Health and Social Services, 1986-87). Characterized in this way, the policy might seem of small significance. But, in fact, it is worthy of serious attention by observers inside and outside of Canada for a number of practical and theoretical reasons.

On the most immediate level, the needs of mentally ill persons, particularly the chronically and severely afflicted, remain poorly met. Newspaper reports in Quebec have documented the insufficient supplies and disorganization of community support services for this population (see, e.g., Parkes, 1991). Research has linked this problem with the thousands of mentally ill homeless found in major metropolitan areas like Montreal (Dunn, 1991). Other provinces face much the same issues, as do the states (Rochefort, 1992). In fact, it is fair to say that, while model programs do exist in certain locations, no nation has yet developed an adequate, comprehensive response to the needs of the mentally ill in the community. Moreover, the types of problems nations face in this endeavor are remarkably similar, despite other political, social, cultural, and economic differences (World Health Organization, 1987). To the extent that Quebec's attempted reform can demonstrate tangible improvements in the lives of mentally ill persons, it belongs to move center stage in this ongoing international policy discussion.

From an American point of view, Quebec's mental health policy holds special interest in yet another practical sense. As health care reform has advanced as an issue on the national political agenda, the U.S. has turned its attention abroad in search of models known to be effective elsewhere. No country has captured greater interest in this process than Canada, whose national health program offers lessons to U.S. policymakers on how to provide universal insurance coverage with limited cost increases. However, it is important for American observers to understand the weak points as well as the strong points of a system organized as Canada's. The mental health care realm yields insight into certain deficiencies of Canada's Medicare program and, through pathbreaking efforts like Quebec's, the strategies that might be incorporated into such a structure to improve its reach and performance.

In addition to these important practical concerns, Quebec's mental health policy also holds special interest for social scientists seeking to use it as a basis for testing existing concepts, and constructing new formulations, regarding the functions of the state in democratic society, a topic to which we will return at the close of this paper.

In sum, Quebec's mental health policy operates at the intersection of

broad administrative, programmatic, and intellectual concerns in Canada, the United States, and other nations. For this reason, its fate speaks with unusual relevance to key issues in contemporary mental health care and beyond.

EARLY IMPLEMENTATION FINDINGS

Far from the static bureaucratic execution of legislative design, public policy analysts recognize implementation as a highly dynamic stage fraught with pitfalls and opportunities for programmatic redirection. It is both an ongoing process of error correction (Levin and Ferman, 1985) and "the continuation of politics by other means" (Bardach, 1977: 85). Viewed in this light, Quebec's mental health policy, with barely one planning cycle completed, is still in its operational infancy. Evaluators will need to track it for many years to come if we are to get a firm sense of consequences for the variety of populations affected. At this early point, however, it is possible to outline a number of key issues that suggest the impediments needing to be overcome by a change strategy of this nature.

The regional planning process established by the mental health policy, and managed by the Regional Health and Social Service Councils, has technical and representational functions. Technically, it must carry out a systematic assessment of population needs, current service structures, and future program priorities. But the mental health field has no single set of straightforward, widely-accepted methodologies available for such an analysis. Given this lack of a source of "neutral" authority for making planning decisions, the consideration of system-reorientation necessarily calls upon varied kinds of quantitative and qualitative data whose proper weighting within the process is unclear. What results is a very complex discussion that puts at special disadvantage those planning participants with limited background in the mental health field (and prior exposure to this form of dialogue). Boudreau (1991a: 22) notes this problem, as well, and casts it as a lack of "linguistic capital." Other barriers to effective planning participation by users of the mental health system and their families that she notes include nonprofessional demeanor, feelings of being out of place, perceived lack of credibility, and a reluctance to make personal disclosures about their mental health treatment experiences.

In its representation function, the planning process clearly is meant to join in common effort groups having contending perspectives on the mental health system and whose past conflicts have impeded centralized policymaking. The main polarity targeted for abatement is that between institutional administrators and medical providers on the one hand, and the anti-psychiatry movement on the other. The former have been in control of the mental health system since the asylum's origins in the mid-eighteenth century; dating back to the 1970s, the latter has developed a strong self-identity and alternative philosophy favoring deinstitutionalization accompanied by consumer-based social supports. Not surprisingly given the presence of these two parties, planning deliberations have featured ideological disagreements and have been fraught with mutual suspicion. Often, practical questions of service performance have been submerged by the issue of whose value system will win out. Caught in the middle, and often bemused by the struggle, have been non-consumer-based advocates, community providers (including family groups), and the third group defining the tripartite planning structure—local non-mental health community and organ-

izational representatives.

To members of the alternative resource movement, their very inclusion on the official planning bodies jeopardizes their sense of independence and their value as critics of the system. Thus they are ambivalent about the representational function with which they have been charged, or at least the political context in which it must be exercised. Another representational issue concerns the exclusion of a major system player as a designated planning partner, the large corps of workers who staff the present service system and who will be much affected by any reconfigurations achieved through the planning process. Summarizes Morin (1992: 24), a member of the tripartite committee for the Montreal region: "[I]t is difficult to understand why the thousands of men and women who work in the public service have been disregarded in the Policy. Very little is said in recognition of their work, or in regard to the democratization of the public services or the relationships they must maintain with the community to favour its effective organization."

The idea of the community as a "living environment" and site of service delivery is central to the mental health policy. The policy (1990: 14) states, for example: "Closer contact with their natural surroundings is one of the best ways of ensuring an optimal response to the needs of persons who require mental health services." Maximizing social integration is the form this value takes within the planning process, per provincial order. For all its importance, however, there is much uncertainty about the precise meaning "community" is to take in different contexts. What are its geographic boundaries and psychosocial identifiers? Is a community service defined simply by location or by underlying philosophy and organizational auspices? On this latter question, the policy takes no official stance. Instead, it lumps together diverse groups in the community mental health third of the planning committees. By approach, resource levels, referral networks, etc., however, this is far from a unitary group. Some observers and participants feel that the policy errs in not recognizing such differences explicitly. It may be, also, that the policy assumes too much capability for effective input and responsibility by many communities and their unempowered groups, hoping for something to happen spontaneously that actually requires careful fostering from above.

Acting in combination with these flaws in the process are important structural factors that also limit resource reallocation. The policy emerged during a period of provincial budgetary scarcity, and few additional resources were made available for regional planners to distribute—a $32 million "development budget" spread out over four years. This compares with estimated total Quebec mental health expenditures of about $1 billion (Morin, 1992). About 65 percent of this sum goes to the province's psychiatric hospitals. Yet removing this money from institutional accounts will be extraordinarily difficult, not only because of the presence of hospital administrators and psychiatrists on the planning committees, but also because of provincial-level political commitments to union jobs in public facilities. Finally, few foresee that regional planning groups will be able to get their hands on the medical insurance funds which pay for fee-for-service psychiatric practice by specialists and GPs, a major source of public mental health expenditure. Provincial mental health planners had hoped the situation would be otherwise, but the power of Quebec's medical profession prevailed.

It is, then, just these kinds of political realities--on provincial, regional, and local levels--that will prove crucial in determining how far the mental health policy goes and how fast. Boudreau (1991b) has written perceptively about how the concept of "partnership" seems meant to smoothe over such conflicts and to remove provincial policymakers from the position of having to exercise their authority to resolve them. But when planning partners have unequal resources and influence, the outcome is likely to be systematically biased. And according to Boudreau's (1991a) analysis, virtually no one comes to the planning table ready to give up what they already have. Rather, each participant enters the partnership interpreting it in his or her own way so as to permit continued pursuit of preexisting agendas.

A RESEARCH AGENDA

This preliminary report highlights a number of important empirical questions that require investigation for a full evaluation of Quebec's 1989 mental health policy and its aftermath.

Aside from ideological issues about who should be providing different forms of community services, what evidence is there about the actual impact of different providers on the client level in terms of rehospitalization, satisfaction with services, efficiency, etc.?

Are more service referrals occurring across the tri-partite groups as a result of their common involvement in the planning process?

To what extent are community services, as feared by some, coming to serve as "feeders" into the traditional public establishments?

As institutional staff are relocated to the community, do their attitudes remain institution-bound or do they become more community-oriented?

As the planning process moves to implementation, are different personnel involved from participant organizations--say, managers rather than clinicians--and with what implications?

To what extent has the planning process served to inform the public about mental health policy concerns?

These research questions outline a multidimensional analysis intended to encompass several interrelated tensions underlying Quebec's complex new policy: rational planning vs. politics; theory vs. practice in organizational process; and intended vs. unexpected consequences.

A NOTE ON STATE THEORY

Already, a number of competing perspectives have emerged relating to Quebec's mental health policy and questions of state theory. Underscoring the obstacles to systems reorientation, even when bolstered by strong internal and external support, one approach emphasizes the capacity of institutional and medical powers to perpetuate their influence within a democratized planning and decisionmaking process ostensibly devised to promote community care (White and Mercier, 1991). Another perspective

calls attention to a "[swinging] pendulum of public administration" between centralization and decentralization in Quebec over the last few decades, characterizing the mental health policy as emblematic of the latter extreme and founded on vague notions of community organization and representation (Morin, 1992).

Boudreau (1991) interprets Quebec's mental health policy as the application of "neocorporatist ideas" to the management of human services and sees the concept of partnership as the attempt to craft a post-pluralist solution to problems of resource scarcity and weakened public authority. Without deeper structural transformations than those now entailed by the strategy, she questions how much change ultimately will be possible. Another slant on this partnership theme, however, approves of its intent to integrate planning and financing functions and emphasizes the real reform possibilities, provided the state can use new decisionmaking structures to strengthen its position vis à vis traditionally dominant interests (Rochefort, 1991).

Which model of the planning initiative, and of the state's role within it, emerges as most accurate, according to research to date? To be sure, among participants and commentators there is no clear consensus on the character of Quebec's undertaking. For some, provincial government is relinquishing its proper responsibilities by decentralizing planning and budgetary activity. Others think decentralization might be a way of attempting to undercut powerful interests. In assessing these divergent views, it is important to note the powerful functions retained by the province within its new policy system. It is the province that has determined allocation of development monies. Provincial authorities also approve the regional plans based on conformity with overarching criteria arising from the fundamental goals of the policy. This approval process is lengthy and, for the majority of plans reviewed, has resulted in rejections or conditional acceptances. Ministry personnel express dismay that the regional plans do not go farther in redirecting resources to community-based care. Far from a hands-off devolution of responsibility, these considerations point to the policy as a vehicle for managed redistribution, but at a distance and intermittently. By means of the new mental health policy, provincial authorities have attempted to breathe life into a mechanism that will carry out mandated objectives with broad-based local support. But local autonomy ends with deviation from the collective, centrally-specified purpose.

Past macro studies of social policymaking tend to downplay the role of the state. As Skocpol and Amenta (1986: 147) write: "Until recently, most work on the determinants of social policy has emphasized their socioeconomic roots and has treated states as if they were merely arenas of political conflict or passive administrative tools to be turned to the purposes of any social group that gains governmental power." Increasingly, however, there is recognition that states may carve out an autonomous role in society, exercising influence independent of dominant elites to pursue their own aims. Typically, this scenario assumes centralization as the means by which public capacity is developed and utilized. But in its mental health planning initiative, Quebec seems to exploring another route, the use of regulated decentralization and delegation as a policy instrument.

Skocpol and Amenta remind us that "not only does politics create social

policies; social policies also create politics" (p. 149), and there can be no more direct means of realizing the latter proposition than establishment of a broadly participatory planning mechanism. How Quebec officials manage the paradox of a "centrally-controlled decentralization" as political forces, old and new, come to the fore on the subprovincial level will define the true character of this reform.

In the end, the strongest asset of the new mental health policy may be that no one, not even its strongest critics, has a clear vision of what would be a preferable alternative. For different reasons, the idea of a top-down policy process is anathema to virtually all who are involved. Even while doubting the potential of regional-level partnerships to accomplish the scope of change with which they have been charged, many observers express hope that current difficulties can be ironed out and that the new approach will be redeemed.

ACKNOWLDEGMENT

This research was funded by a Quebec Studies Grant from the Quebec Ministry of International Affairs.

Financial System Reform in Transitional Economies: The Role of Political Institutions

Gretchen R. Rodkey
The University of Michigan

Paper to be presented at the Annual Meeting of the American Political Science Association, Washington, D.C., September 2-5, 1993.

A developed financial system plays an indispensable role in an efficient market economy. It mobilizes and channels savings to productive uses and investments, facilitates transactions, and allocates risks within a society. For countries undergoing extensive economic reforms, financial sectors play a crucial role in stabilization policies and structural transformations. The rapid development and efficient functioning of financial sectors are therefore crucial for the previously centrally planned economies of Eastern Europe and the former Soviet Union.

This paper examines the political causes and consequences of different approaches to financial sector reform. It begins with a discussion of three dimensions of a financial system and reforms associated with each of them. The second section presents the explanatory variables -- the insulation of economic decision makers from political pressures and the strength of opposition within the legislature -- and the hypothesized reform paths for the different East European and former Soviet states. The paper continues with a comparison of predicted and actual reforms. The conclusion considers the ramifications of different approaches to reform for financial systems' future shapes and governments' abilities to intervene in financial markets.

The Dimensions of a Financial System and Strategies For Reform

The financial sectors of various countries display different degrees of autonomy, concentration, and selectivity. Reforms directed at improving the efficiency of financial markets tend to emphasize one dimension over the others. This section describes these dimensions and characterizes the prereform financial systems of Eastern Europe and the former Soviet Union. It concludes with a discussion of reform strategies associated with each dimension.

Financial System Dimensions

A financial system possesses three dimensions: autonomy, concentration, and selectivity. *Autonomy* refers to the extent to which the allocation of credit is independent of political constraints. It depends upon the dominant means of raising capital in an economy, the state's relationship to providers of finance, and the number of financial intermediaries available. Capital market preeminence characterizes autonomous systems and leaves funding decisions outside of state control. Governments have slightly more influence in directing industrial change when credit provision by a small number of financial institutions becomes the dominant means of providing capital to industries. In the least autonomous case, direct control over prices and bank lending enables the government to channel the nation's financial resources to priority areas, which are most likely determined on the basis of political criteria.

Concentration denotes the locus of governmental decision-making in regards to the financial system. The highest levels of concentration occur when the financial assets under government control are held in a single location, such as a development bank. As government controlled assets become more dispersed, concentration decreases. The more institutions or complex organizations share and divide up tasks, the less coherent, coordinated and quick is the use of instruments likely to be.

Selectivity pertains to the tools available for government intervention in financial markets. Selectivity rises as the number of instruments and their frequency of adjustment increases. Development finance institutions, which follow state investment plans, enable

government to explicitly direct credit to targeted industries and types of firms.[1] Other avenues for selective government intervention include direct lending requirements, preferential refinance rates, interest rate controls, and differentiated reserve requirements. Selectivity decreases as the government involvement becomes limited to strictly monetary instruments, such as reserve requirements and discount rates. Primary reliance on open market operations constitutes the most imprecise means of financial intervention. High selectivity allows a government to swiftly and directly channel funds to particular projects or groups. More indirect policy tools take longer to achieve desired effects and have less assured results. Imprecise financial instruments often require greater theoretical and technical sophistication since the utilization of tools has less directly visible results.

Financial Systems Under Central Planning

Financial sectors in the previously centrally planned economies were essentially passive until the late 1980s. Beginning in Hungary in 1987, communist governments began to recognize the advantages of an efficient financial system. Wishing to force enterprises to rely upon self-financing, reform minded policy makers adopted tentative financial sector reforms.[2] These reforms were largely limited to separating central from commercial banking functions and creating a number of specialized state-owned commercial banks. Such measures did little to alter the essential character of the financial sector.

Financial system autonomy was virtually nonexistent. The central bank acted as a monobank, handling enterprise accounts as well as foreign exchange transactions. Credit allocation was made in accordance with the national economic plan.[3] Even when the single central cum commercial bank was broken into specialized banks, the central plan set the rates and amount of credit. Private or foreign ownership was prohibited. Without money or equity markets, sources of finance outside of the state-controlled banking sector were nonexistent.

Financial systems under central planning tended to possess low levels of concentration. Although financial resources were held in a relatively small number of state banks, credit allocation decisions were rarely made as a part of coherent programs for targeting economic growth. Credit decisions were shared among countless ministries, departments, and levels of government. The information overload that occurred on account of the multitude of decisions to be made under central planning meant that the greatest predictor of an annual credit policy was the previous year's, as past policies provided the most reliable indicator of economic efficiency.[4] Even the actions of enterprises had an effect on credit allocation. Because enterprises were almost automatically granted credit, even if they exceeded their planned allocation, they lacked

an incentive to stay within their prescribed limits.[5] As the following year's allocation of credit was dependent upon past credit consumption, enterprises were able to increase their future lines of credit simply by exceeding their present allocations.

The selectivity of financial systems under central planning was underdeveloped. Governments relied upon direct credit limits and the provision of refinance credit to influence bank lending, but had no other instruments at their disposal. Interest rates had no allocative role and reserve requirements were not used. The lack of commercial paper and government securities precluded the development of money markets and the use of open market operations. Governments even failed to use their instruments of direct control selectively. Credit for working capital was automatically granted to firms in order for them to fulfill their centrally planned production quotas.[6] All enterprises were given access to preferential credit.

Reform Paths

While all financial sector reforms that have occurred since the late 1980s have in some way addressed autonomy, concentration, and selectivity, most have tended to give priority to one dimension over the others. This section describes the three reform paths related to each dimension.

Reforms directed at increasing financial sector autonomy entail an attempt to introduce private sector participation and competition into the financial marketplace. Strategies that make autonomy the foremost concern focus on removing barriers to private sector entry into financial markets. All types of ownership of banks and other financial institutions are permitted. State-owned commercial banks are almost immediately transferred to joint-stock ownership. Foreign banks are allowed a liberal range of activity, although their activities may be initially constrained for fear that domestic institutions' inability to compete and already shaky loan portfolios may lead to a severe banking crisis. Loose licensing requirements allow for a rapid proliferation in the number and types of new financial institutions. To quickly remove state control over economic decisions, the creation of stock markets is given priority. Longer term strategies for inducing financial sector autonomy focus on the privatization of the large state-owned banks. This privatization process inherently takes time to accomplish, as the nonperforming portfolios of banks must be cleaned up in order to make banks attractive to investors.

Strategies that focus on concentration entail an attempt to centralize and consolidate control over the financial sector. They are concerned with establishing a single center of responsibility for the financial sector and eliminating the flow of "soft" credit. To do so, governments often restrict the number of new institutions and may even recentralize the few existing ones. The development of a supervisory agency is given top priority. Tight credit policies often accompany reforms directed at concentration.

Concentration and autonomy strategies may seem to be opposite sides of the same coin. A focus on autonomy leads to a proliferation of new institutions. A concern with concentration often entails a decrease in the number of institutions. The difference between the two resides in the fact that a focus on concentration does not demand that a consolidation of the financial system be put under government control. For instance, a

state's financial assets may be consolidated in a single institution which is converted to joint stock ownership and sold to private interests.

Reforms directed at changing financial sector selectivity focus on the development of alternative instruments for government intervention in the economy. Selective interest rate controls and the introduction of reserve requirements add to the government's arsenal of possible intervention tools. A major thrust of reforms is the introduction of commercial paper and government securities in order to foster the development of money markets. Successful development of instruments gives the government options for either direct or indirect intervention in financial markets.

Political Institutions and the Direction of Financial Sector Reforms

This sections presents the political factors that affect economic policy making in countries embarking upon major programs of economic adjustment and structural change. These factors are related to choices over financial reform strategies and predicted reform paths for each of the East European and former Soviet states. The conclusion of this section discusses reform predictions generated by an alternative explanation based on economic criteria.

Political Institutions and Reform Strategies

Political considerations dominate decisions concerning the restructuring of economic institutions. Shaping debates and influencing eventual outcomes of the reform process, broader political institutions provide the framework within which choices over the structure of lower-level institutions are made. Recent works in the field of institutional economics have pointed to the need to examine political factors to account for the creation and maintenance of particular economic institutions.[7] How surrounding political institutions structure authority and control over resources has a substantial impact on the final choice of financial institutions.

Two aspects of a country's political landscape influence the direction of financial sector reforms: (1) key economic decision makers' insulation from political pressures; and (2) the strength of parliamentary opposition to the executive branch.

The insulation of key economic ministers and decision makers influences the coherence, speed, and probable success of reform programs. Reforms under insulated economic teams will be more coherent than under broadly-brokered plans because exceptions and accommodations do not have to be granted in order to ensure the support of all participants.[8] The unity inherent in policy makers' insulation makes consensus over the correct reform path easier to reach and enables reforms to be enacted in a

[7]See Douglass C. North, *Institutions, Institutional Change and Economic Performance* (Cambridge: Cambridge University Press, 1990); Thrainn Eggertsson, *Economic Behavior and Institutions* (Cambridge: Cambridge University Press, 1990); Jan Winiecki, "The Polish Transition Programme: Underpinnings, Results, Interpretations," *Soviet Studies* 44 (1992). North in particular argues that a theory of the state is necessary to explain institutional change. While becoming increasingly sophisticated in their analyses, writers in this line of research have yet to examine the importance of a state's political institutional structures for the redefinition of economic institutions. For a discussion of how political institutions enable the state to shape the economy's organizational structure through the manipulation of property rights, see John L. Campbell and Leon N. Lindberg, "Property Rights and the Organization of Economic Activity by the State," *American Sociological Review* 55 (October 1990).

[8]This viewpoint comes from the same line of work as Mancur Olson, *The Rise and Decline Of Nations: Economic Growth, Stagflation, and Social Rigidities* (New Haven: Yale University Press, 1982).

speedier manner. As almost all economic reforms are painful for the population at large, the insulation of decision makers guards against the reversal of reforms.[9]

Three factors contribute to the insulation of economic decision makers. First is a unitary executive. Control of the executive by a single party or faction enables the decision making process to be much faster and more coherent than when a consensus must be found between the demands of several groups.

The second factor is the independence of the executive from the legislature. Executive branches of government are inherently more insulated than legislative ones. While usually no more than three members of an executive play a major role in formulating economic reforms,[10] consultation of the legislature may require the input of hundreds of members. By the sheer number of participants, executive independence heightens the insulation of policy makers. As the need to consider the broad spectrum of views represented in parliament adds to the cacophony of the decision-making process, dependence of the executive on the legislature may offset the advantage gained by having a unitary executive.

The third factor contributing to the insulation of key economic decision makers is a clear delineation of powers between the executive and legislature. Even in parliamentary systems, a clear demarcation of tasks between executive branch ministers and legislative committees enables key policy makers to ward off encroachment on their jurisdiction. Turf battles between different branches of government act to subvert the reform process, as redundant, often contradictory, policies are enacted. Growing conflict between the two branches causes division of power issues to supplant economic reforms on the country's political agenda.

Unity executives free from legislative control are most often associated with presidential systems of government. Presidential systems promote executive independence and unity by their very definition as systems in which the chief executives are elected for constitutionally prescribed periods and, under normal circumstances, cannot be forced to resign by legislative votes of no confidence.[11] The president's direct election fosters coherence in policy making through single party control of the executive branch. Exceptions to this rule arise when populist presidents without party support hold office or when the president's party fractures midterm.[12] Jurisdictional conflicts with the legislature may further erode executive strength. This situation often occurs under "mixed" or "premier-presidential" systems.[13] In the context of Eastern Europe and the

[9]Adam Przeworski advocates this approach in his prescription for economic reform in Latin America and Eastern Europe, see Adam Przeworski, *Democracy and the Market: Political and Economic Reform in Eastern Europe and Latin America* (Cambridge: Cambridge University Press, 1992); For a discussion of the importance of executive autonomy for successful economic reform, see Joan Nelson, "The Politics of Economic Transformation: Is The Third World Experience Relevant in Eastern Europe?" *World Politics* 45 (spring 1993); and also the case studies in Joan Nelson, eds., *Economic Crises and Policy Choice: The Politics of Adjustment in the Third World* (Princeton: Princeton University Press, 1990).

[10]I am considering the Prime Minister or President, the Finance Minister, and, in the context of transitional economies, the Minister of the Economy.

[11]See Arend Lijphart, *Democracies: Patterns of Majoritarian and Consensus Government in Twenty-One Countries* (New Haven: Yale University Press, 1984).

[12]The importance of party unity is discussed in Michael Laver and Normal Schofield, *Multiparty Government: The Politics of Coalition in Europe* (Oxford: Oxford University Press, 1990).

[13]For the effects of "mixed" systems, see Juan Linz, "The Perils of Presidentialism," *Parliamentary Versus Presidential Government*, Arend Lijphart, ed., (Oxford: Oxford University Press, 1992). For a careful assessment of the power of the presidency relative to the legislature, see Matthew Soberg Shugart and John M. Carey, *Presidents and Assemblies: Constitutional Design and Electoral Dynamics* (Cambridge: Cambridge University Press, 1992).

former Soviet Union, the adoption of mixed presidential-parliamentary systems and the lack of clear distinction between legislative and executive powers have frequently undermined the isolation of economic decision makers and led to extremely open reform processes.

The strength of parliamentary opposition to the executive is the second factor affecting economic reforms. Economic reforms that require structural changes, such as those aimed at the financial sector, often require enabling legislation. High levels of parliamentary opposition hinder the adoption of all or part of the executive's reform program. Since the previously centrally planned economies' ongoing processes of economic reform entail the simultaneous transformation of interconnected markets and institutions, the inability of executives to pass part of broader reform package jeopardizes the success of other, related reforms. If the executive's survival is dependent upon parliamentary approval, continuous parliamentary opposition to executive policies may lead to short-lived governments. Under either parliamentary or presidential systems, unrelenting deadlock between the two branches will often force the executive to alter reform measures to appease opponents and enact at least part of its package.

The strength of parliamentary opposition comes from two sources. The first is the number of seats held by opposition parties in the legislature. Quite obviously, the less support the executive is assured of in the legislature, the more the formulation of policies has to take the opposition's views into account.

The second source of opposition strength comes from unity among members of the opposition. Opposition strength declines considerably if members are unable to agree among themselves and present a united front against the executive. Individual members of a fragmented opposition may try to block government polices on the issues which are of most concern to them, but are unable to pose a real threat to reforms.

Certain electoral system arrangements support the creation of strong oppositions. A majority or single-member district plurality system leaves all candidates, except the winner of the largest number of votes, without representation. The party gaining a nationwide majority or plurality of votes tends to control a disproportionate share of parliamentary seats. As large parties are overrepresented and small parties underrepresented, a majority or plurality electoral system may "manufacture majorities."[14] Assuming that some of the unrepresented parties would support the government and some would support the opposition, majoritarian electoral systems enhance opposition strength by decreasing the number of opposition parties and factions.

Political Institutions and Financial Sector Reforms

Combining the insulation of economic policy makers and the strength of parliamentary opposition leads to four possible outcomes: (1) politicized reformers/low opposition; (2) politicized reformers/high opposition; (3) insulated reformers/low opposition; and (4) insulated reformers/high opposition. Each of these combinations results in a different style of policy making and in a different focus for financial sector reforms. By placing each of the East European and Soviet successor states in one of these four categories, predictions may be derived for the focus of their efforts at financial sector reform.[15]

(New Haven: Yale University Press, 1971); and also Rein Taagepera and Matthew Soberg Shugart, *Seats and Votes: The Effects and Determinants of Electoral Systems* (New Haven: Yale University Press, 1989).

[15]Explanations for the coding of each country are given in Appendix I. Albania is not included for lack of data. I also have reservations about including Albania in the same population as the other

The placement of these countries is based on their political situations at the time of passage of major banking legislation. This choice was made because laws serve as the backbone of institutions. In theory, the institutions' legal bases are subject to increasing returns. Once in place, they encourage economic agents to modify their behavior in accordance with the incentives provided by written rules.[16] The passage of legislation also serves as the nexus of financial sector change. The arrival of banking reforms on the legislative agenda sparks debate over the ideal shape of financial sectors and the appropriate sequence of reforms. Other non-codified policies affecting the autonomy, concentration, and selectivity of financial sectors additionally accompany the passage of legislation.

This study covers the period of time from the end of 1989 to March of 1992. In almost all cases major pieces of banking legislation were passed during this time. A cutoff date of March 1992 was chosen for two reasons. First, beginning in March 1992 several states embarked upon a second round of financial sector reforms. Secondly, a complete set of data for all countries was unavailable for the second half of 1992.

Group I: Politicized Reformers/Low Opposition. Usually occurring under conditions of parliamentary government and electoral systems based on proportional representation, this scenario of divided reformers and low levels of parliamentary opposition leads to mid levels of autonomy, high levels of concentration, and low levels of selectivity. As members of the government are primarily concerned with keeping their fragile coalition together, yet are constrained by the need to keep their own party or faction intact, they face the opposing pressures of wanting to keep the financial sector firmly under government control in order to provide benefits to their constituents and of wanting to decrease government intervention in credit decisions in order to prevent their coalition partners from using state control of the financial sector to their own advantage. Concentration is high as policy makers wish to closely regulate financial markets in order to prevent excessive intervention in credit allocation decisions by members of the government from other factions. The need for economic elites to compromise leads to low levels of selectivity as indirect financial instruments produce less clear winners and losers of government investment policies. By controlling financial decisions at a distance, economic elites are able to avoid voter retribution and to deflect future criticisms by rank-and-file party members dissatisfied with policies reached through compromise agreements. Countries exemplifying this approach include the Czech and Slovak Federated Republic and Latvia.

Group II: Politicized Reformers/High Opposition. This situation most often comes about in parliamentary systems with majoritarian electoral arrangements. Politicized reformers facing high parliamentary opposition adopt measures aimed at creating financial sectors characterized by low autonomy, low concentration, and high selectivity. A fragmented or vulnerable executive contributes to a political climate that may be marked by horizontal coalition building and bargaining among executive participants. The presence of a credible opposition makes the need to keep the fragile ruling coalition together particularly salient. Decisions require the approval of all partners in governing coalitions, who usually represent several different constituencies with their own particular demands. Even when one party is strong enough to form a majority government, reforms must satisfy all wings of the party to guard against a vote of no confidence. Financial reforms focus primarily on improving the selectivity of financial instruments. The highly

---

transitional countries of the region due to its level of economic development. The World Bank has recently reclassified Albania as a least developed country.

[16]For a discussion of this point, see Margaret Levi, "A Logic of Institutional Change," in *The Limits of Rationality*, Karen Schweers Cook and Margaret Levi, eds. (Chicago: The University of Chicago Press, 1990).

politicized, zero-sum nature of the executive prompts lawmakers to push for particularized benefits for their constituents. The largest party in the ruling coalition focuses on the development of money markets as the transfer of control over credit expansion from direct to indirect instruments enables them to remove their opponents' influence. Some measures will be taken to increase financial sector autonomy due to the threat of a government takeover by the parliamentary opposition, but policy makers' need to use the financial benefits as a means of attracting wayward coalition partners greatly constrains the final level of autonomy. Concentration is high as policy makers wish to reestablish a single center of control. Countries that exemplify this approach are Hungary, Romania, Azerbaijan, and Lithuania

Group III : Insulated Reformers/High Opposition. Most often associated with presidential systems and majoritarian electoral systems, this scenario leads to high levels of autonomy, medium levels of concentration, and low levels of selectivity. Able to formulate clear policies, yet facing rising opposition, policy makers in this instance are primarily concerned with overcoming bureaucratic opposition and reducing the ability of the parliament to thwart reforms. Since the arousal of opposition poses the greatest threat to reforms, an executive's best strategy is to enact quick and drastic measures to ensure that reforms are not sabotaged during implementation or reversed should the executive lose the confidence of the legislature. An emphasis on autonomy characterizes financial sector reforms under these conditions. To prevent subversion of their reforms, insulated decision makers make removal of government intervention in financial markets a top priority. They attempt to increase the concentration of the financial system, but their efforts meet fierce resistance from members of parliament and the bureaucracy, who enjoy substantial de facto control of credit decisions under the current decentralized conditions. As the development of financial instruments requires the acquiescence of members of the bureaucracy who are likely opponents of reform, policy makers pay the least attention to increasing the range of capabilities for government intervention. Countries falling under this rubric include Bulgaria, Armenia, Estonia, Georgia, and Russia.

Group IV: Insulated Reformers/Low Opposition. The combination of insulated reformers and low parliamentary opposition should occur most often under presidential systems with electoral arrangements based on proportional representation. This combination results in financial sectors marked by low autonomy, low concentration, and high selectivity. Politics in countries lacking a strong center for economic decision making and an opposition with representation in parliament have changed very little since 1990. Financial sector reforms are essentially modifications of the status quo. Lax credit policies continue, and responsibility for the financial sector remains elusive. Open/Low Opposition characterizes Poland in 1989, Romania, Kazakhstan, Kyrgyzstan, Moldova, Taijikistan, Turkmenistan, Ukraine, and Uzbekistan.

These predictions may be summarized in the following two-by-two table:

	Low Parliamentary Opposition	High Parliamentary Opposition
	GROUP I	GROUP II
Divisions Among Economic Decision Makers	Focus on Concentration: Med. Autonomy High Concentration Low Selectivity Predicted Countries: CSFR Latvia	Focus on Selectivity: Low Autonomy High Concentration High Selectivity Predicted Countries: Hungary Azerbaijan Lithuania Romania
	GROUP IV	GROUP III
Insulation of Economic Decision Makers	Revamped Status Quo: Low Autonomy Low Concentration High Selectivity Predicted Countries: Poland (89) Belarus Kazakhstan Kyrghystan Moldova Taijikistan Turkmenistan Ukraine Uzbekistan	Focus on Autonomy: High Autonomy Medium Concentration Low Selectivity Predicted Countries: Bulgaria (91) Armenia Estonia Georgia Russia

An alternative explanation for the financial section evolution focuses solely on economic criteria.[17] Based on the development of financial institutions in established market economies, the economic model posits three stages of financial sector development.[18] The first stage is one of bank dominance. During industrialization when per capita income is low, most savings are collected and allocated by banks.[19] The

[17] The work of Alexander Gerschenkron is closely associated with this argument. See Alexander Gerschenkron, *Economic Backwardness in Historical Perspective: A Book of Essays* (Cambridge, MA, 1962). For a critique of the Gerschenkron hypothesis as it applies to Austria, Italy, Spain, Serbia, Japan, and the United States, see Rondo Cameron, ed., *Banking and Economic Development: Some Lessons of History* (New York: Oxford University Press, 1972).

[18] See T.M. Rybczynski, "The Role of Finance in the Restructuring of Resource Allocation in Eastern Europe," *The New European Financial Marketplace*, Alfred Steinherr, ed. (New York: New York University Press, 1992).

[19] Problems of financial deepening during this stage are the primary concern of economists working on the reform of financial sectors in developing countries. The classic statements of this problem are found in Ronald McKinnon, *Money and Capital in Economic Development* (Washington, D.C.: The Brookings Institution, 1973); see also E. S.Shaw, *Financial Deepening in Economic Development* (New York: Oxford University Press, 1973).

second stage is one of emerging market orientation. It takes place as enterprises begin to turn to capital markets to raise a growing proportion of external capital. Non-bank savings collecting institutions, such as pension funds and insurance companies, also use capital markets for reallocating and investing savings. Capital markets dominate the third stage of financial sector development. As services replace manufacturing and per capita income continues to grow, financial and non-financial enterprises continue to rely increasingly on capital markets that draw the savings of individuals and non-bank savings collecting institutions. Progress through these stages is primarily dependent upon wealth of the population. The economic model posits that per capita GNP should be positively related to financial sector autonomy and negatively related to concentration and selectivity.

Predicted Paths and Recent Reforms

Because time is needed to develop skills and imbeded norms, the development of financial institutions is an inherently lengthy process. These first steps toward reform must therefore be treated with caution. In almost all cases, however, predictions derived from the insulation or susceptibility of economic decision makers to political pressures and the level of parliamentary opposition accorded with actual directions of reform.

Autonomy. The number of commercial banks per capita proxies financial sector autonomy. As an excessively high degree of state control over financial resources marks each of these countries, the number of banks per capita reflects each country's relative encouragement of a challenge to the state's monopoly of financial resources. As policy makers have encouraged competition to state-owned banks, new commercial banks have proliferated. Table III shows the number of new banks per capita in each group.

Table II: Number of Banks Per Million Individuals, March 992.

Financial sector reforms in countries characterized by politically vulnerable economic policy makers and high levels of parliamentary opposition conform to expectations and focus on increasing financial sector autonomy. These countries in Group III additionally enacted other policies aimed at inducing financial sector competition. For instance, with the exception of Armenia, all of the countries in Group III had allowed the free

determination of interest rates by the end of 1991. In contrast, only Poland and Romania among the other groups had abolished interest rate controls by this time.[20]

The results of a regression of financial sector autonomy on a set of political and economic variables are shown in the first column of Table III. GNP per thousand members of the population in terms of purchasing power parity indicates level of economic development. This measure was chosen because it eliminates the distortions caused by fluctuating exchange rates and gives a relative assessment of an individual's level of subsistence. A series of dummy variables indicates a country's membership in one of the four categories. The regressions were run using Group IV as the constant term in order to compare memberships in Groups I through III with status quo policies. A dummy variable indicating a former Soviet republic was included for specification reasons.

Table II: Regressions of Autonomy, Concentration and Selectivity on Economic and Political Factors

	Autonomy	Concentration	Selectivity
Constant			
	-3.15	3.75	49.72
	(2.05)	(1.29)	(9.98)

*denotes significant at the .05 level

A political landscape marked by high levels of parliamentary opposition is critical for increasing the autonomy of the financial system. Positive coefficients on membership in all three groups indicates that countries in Group IV tended to be the most restrictive of new bank creation. This result supports the earlier characterization of Group IV reforms as being status quo oriented. Both membership in Group II and in Group III were found to have a statistically significant relationship to an increase in the number of banks. The relatively larger coefficient on Group III membership is consistent with the hypothesized relationship between united policy makers confronted with obstructionist legislatures and high levels of autonomy. The statistically insignificant relationship between membership in Group I and autonomy accords with the earlier proposition of a lack of a clear

[20]Even this fact overstates the ability of banks in other countries to set their own interest rates. Despite the nominal free determination of interest rates in Poland, most banks are encouraged to set their rates in accordance with the central bank refinancing rates.

relationship between financial sector autonomy and divided economic decision makers in the presence of parliamentary opposition.

The economic and past membership in the U.S.S.R. variables also yielded interesting results. Former Soviet republics are likely to have more banks per capita than states in Eastern Europe. This finding is not surprising due to the liberal licensing laws prevailing in the U.S.S.R. prior to 1990. The effect of per capita GNP has a noticeably uncertain effect on the number of banks.

Concentration. Concentration of government control over financial markets is measured by the inverse of the sum of each state-owned bank's percentage of total state-controlled financial assets (concentration=$1/\Sigma$ (% state held assets)). This indicator provides a measure of the "effective" number of state banks, weighted by the size of each bank. As the number of banks increases or the dispersion of state resources becomes more even across state banks, the "effective" number of state banks increases accordingly. This measure of the real number of state banks is analogous to a standard measure of the "effective" number of political parties.[21] The "effective" number of state banks is negatively related to concentration. Table IV presents each country's effective number of state banks.

Table IV: Effective Number of State Banks, as of March 1992.

Group I		Group II		Group III		Group IV	
CSFR	3.63	Hungary	3.75	Bulgaria (91)	1.81	Poland (89)	7.98
Latvia	1.08	Romania	2.72	Armenia	2.00	Belarus	2.43
		Azerbaijan	2.43	Estonia	2.69	Kazakhstan	2.16
		Lithuania	2.05	Georgia	2.26	Kyrgyzstan	2.09

Source: International Monetary Fund

The results of a regression of concentration on the level of economic development, political situation, and former status as a Soviet republic are presented in the second column of Table III. Although the results are non-conclusive, a focus on concentration may be associated with membership in Group I as hypothesized. The relative magnitudes of the coefficients accord with the hypothesized relationships between political factors and levels of concentration. The largest negative coefficient on Group I membership is consistent with the prediction that divided economic decision makers with low levels of parliamentary opposition will seek to increase control over the financial sector. Since reforms have tended to emphasize the recentralization of economic decision making, the universally negative coefficients on membership in Groups I through III correspond to the characterization of Group IV as being status quo oriented.

---

[21] See Taagepera and Shugart (ft. 14).

Given the limited number of cases within Group II, which consists only of Latvia and the Czech and Slovak Federated Republic, the regression results are extremely susceptible to the influence of unique events. The federated nature of the CSFR, which led to a division of the old state savings and commercial banks into separate Prague and Bratislava banks, served to decentralize the Czechoslovakian financial system. The score of the Czech republic taken alone, 2.83, indicates that the federal nature of the republic may have understated the extent membership in Group I focuses attention on the concentration of the banking system.

The effects of per capita GNP and past status as a Soviet republic had efects on concentration similar to the effects they had on autonomy. The small and statistically insignificant coefficient on per capita GNP implies that a country's level of economic development is unrelated to financial system concentration. The large negative and statistically significant coefficient on the Soviet variable demonstrates that past status as a Soviet republic greatly enhances the concentration of a country's financial system. This concentration is a legacy of the 1988 Soviet financial sector reform which split the monobaking system into five specialized state banks. Each republic had a head branch of these five banks and used them as the basis of their own state financial system after declaring independence. As their assets were often held in Moscow, several of these banks were insolvent and forced to close.

Selectivity . An index of utilized government instruments comprises the selectivity measure. Appendix II describes the construction of this index. It takes into account direct and selective controls, discount and refinancing operations, open market operations, and reserve requirements. It resembles John Woolley's index of the complexity of monetary instruments.[22] Table V displays the selectivity score of each country:

Table V: Selectivity Index, as of March 1992.

Group I		Group II		Group III		Group IV	
CSFR	34	Hungary	47	Bulgaria (91)	34	Poland (89)	53

The results of a regression of selectivity on per capita GNP, group membership, and status as a former Soviet republic are presented in the third column of Table III. The

[22]John T. Woolley, "Monetary Policy Instrumentation and the Relationship of Central Banks and Governments," *Annals of the American Academy of Political and Social Science* 434 (1977), 151-73.

negative and statistically significant coefficients on membership in each of the groups indicate that members of the status-quo-oriented Group IV are likely to focus reform efforts on increasing the means of government intervention in financial markets. Group I conformed to expectations and displayed the lowest level of selectivity. The one surprising finding is the relative size of the coefficients on Group II and Group III. Member states of Group II were predicted to establish more selective controls than Group III. However, the differences between the coefficients is not large (.42) and may be indicative of the general difficulty in removing blunt instruments of state control, particularly in an economic climate marked by rising inflation and depression. The relatively high level of selectivity displayed by Group II countries may also be indicative of insulated executives' desires to use credit policies to build support in the face of rising parliamentary opposition.

The coefficients on the economic and former Soviet republic variables were as expected. Per capita GNP had no statistically significant effect on selectivity. This finding refutes the argument that selective government involvement is necessary at all levels of relatively lower economic development. The negative coefficient on status as a former Soviet republic is explained by the relative time frame necessary to establish a variety of government tools of intervention. Until recently, a common currency has linked the majority of the former Soviet states to Moscow.

Current Reforms and The Future Shape of Financial Systems

Three main findings emerge from this first attempt to examine financial reform in post-Soviet and East European states. The first is the inability of economic factors to explain variations among these countries in terms of number of new banks, concentration of state banking institutions, and selectivity of instruments for government intervention. Since these indicators are associated with different types of financial systems, a topic which will be addressed below, this result has important implications for undue reliance on level of economic development explanations for the evolution of different financial sectors. Economic factors are likely to play a role in determining the shape of financial sectors during the period of industrialization. At a later stage of industrial development, pure focus on the legacy of the past is not enough. Financial institutions are one of the most regulated sectors of any market economy. The structure of political institutions and the incentives that they impact to policy makers must be taken into consideration when explaining cross national variations in financial systems.

The second finding of this study is that the past does matter. While not serving as the sole determinant of financial sectors in subsequent time periods, the legacy of past reforms cannot be immediately overridden. This fact is apparent in the consistent statistical difference between financial structures in the former Soviet and East European states. Past studies have called attention to the importance of path dependency in explaining economic development within market economies and differences in East European privatization strategies.[23] While this project rejects staunch determinist interpretations of the past, it recognizes that history cannot be discounted.

---

[23]For a discussion of path dependent economic development within a market economy, see Brian W. Arthur, M. Ermoliev, and M. Kaniovski, "Path Dependent Processes and the Emergence of Macro-Structure," *European Journal of Operational Research* 30 (1987), 294-303 ; and also John E. Jackson and Gretchen R. Rodkey, "Business Creation and the Local Political Economy," paper presented at the annual meeting of the American Political Science Association, Sept. 3-6, 1992, Chicago, IL; For a discussion of path dependency as it relates to privitization strategies in Eastern Europe, see David Stark, "Path Dependence and Privatization Strategies in East Central Europe," *East European Politicsand Societies* 6.1 (Winter 1992), 17-54.

The third import of this study is the attention it draw to differences among reform strategies. Although it is certainly too early in the transition process to know the final structure of these states' financial markets, speculation can be made as to the implications of particular reform paths for the future shape of financial systems in the transitional economies.

Ambiguous levels of autonomy, high levels of concentration, and low levels of selectivity follow from divided decision makers facing little parliamentary opposition. In the long-term, these reforms are expected to place responsibility for major investment decisions with functionally autonomous organizations. High levels of concentration render the most likely wielders of this power universal banks. Low levels of selectivity leave governments with little ability to target particular industries, unless ownership of powerful banks grants them a voice. Governments facing more autonomous financial systems must rely on persuasion to coax financial support for favored industries. This situation resembles the continental European model of finance.

High levels of parliamentary opposition combined with divisions among members of the executive lead to slightly higher levels of autonomy, concentration, and selectivity. State-owned banks remain responsible for almost all of the nation's financial assets and liabilities. Limits on the entry of new banks and financial institutions render alternative forms of raising capital virtually nonexistent. Stock and bond markets, as potential threats to state control, are discouraged and remain underdeveloped. With high concentration and a medium level of selectivity, governments may use indirect means of directing credit in the face of strong opposition. Alternatively, they may rely on direct means to supply favored industries and enterprises with credit at preferential rates. This situation resembles a Newly Industrializing Country (NIC) model of finance.

United control of economic decisions and the presence of strong resistance in the legislature results in high autonomy, high levels of concentration, and the retention of substantial selective tools. Although the government retains influence over the commanding heights of the financial system, high levels of autonomy encourage the transfer of investment decisions away from state control. The high concentration and selective nature of state financial institutions result in a number of state development banks which provide the bulk of subsidized credit in the system. As financial resources are shifted away from government hands, they fall under the control of individuals. This situation resembles an American emphasis on capital markets. If autonomy is encouraged before individuals are able to amass significant amounts of investment capital, other organizations, most notably enterprises, may gain control over investment decisions. This model is prevalent in Russia today and is reminiscent of the Japanese zaibatsu banks at the turn of the century.[24]

United control of economic decisions and low levels of parliamentary opposition lead to a continuation of the status quo -- low autonomy, low concentration, and high selectivity. Political considerations continue to dominate credit allocation decisions. This situation of excessive governmental involvement is akin to financial markets in many developing states.

The establishment of financial institutions -- banking systems and stock and bond markets -- and the role and relative priority assigned to each institution has important

---

[24]I am indebted to Oleg Kharkhordin for drawing my attention to the zaibatsu model. Prior to the Second World War, a great number of financial institutions, each owned and centered around particular industries, dominated the Japanese financial sector. In contrast to present day conceptions of the Japanese financial system, these zaibatsu groups were not state controlled. For a study of the emergence of zaibatsus that refutes the Gershenkron hypothesis of state-led industrialization, see Kozo Yamamura, "Japan, 1868-1930: A Revised View," in *Banking and Economic Development: Some Lessons of History*, Rondo Cameron, ed. (New York: Oxford University Press, 1972).

ramifications for future governmental policies and capabilities in Eastern Europe and the former Soviet states. Reliance on one type of approach or another affects not only the fate of the present transition process, but also governments' future abilities to deal with unavoidable economic dislocations and industrial adjustments. While the time period covered in this paper does not warrant an examination of the establishment of capital markets, the banking reforms enacted from 1989 through March 1992 give a general indication of the direction of financial sector reforms. This examination of early reforms establishes a basis for monitoring subsequent reforms and charting the sources of important cross national differences in financial systems.

Appendix I: Political Classification of Former Soviet Republics and East European States During Periods Of Banking Reform, end 1989 - March 1992

	Date of Legislation	Insulation of Economic Policy Making	Strength of Parliamentary Opposition
Bulgaria			
Popov (Nov '90-Nov '91)	June 6, 1991 - Central Bank Legislation	Insulated. Caretaker government comprised mainly of technocrats. The 3 key economic ministers are representatives from UDF.	High. Broad agreement among all parties to support government
Dimitrov (Nov'91-Oct. '92)	March 18, 1992- Commercial Banking Legislation[1]	Divided. Internal disagreements arise within UDF. By early '92 disagreements between finance minister Kostov and NBB governor Volchev over interest rate policy. Rates lowered several times over the year.	High. Cabinet needs support from MRF party. Podkrepa repeatedly demands resignation of key parliamentary members. Cabinet reshuffle May '92.
CSFR			
Civic Forum/Public Against Violence (June'90-June'92)	Dec 20, 1991 - Both pieces of legislation passed.	Divided. Civic Forum divides into three factions during early '91. Different views on economic reform are key factors in instigating the split. Interparty divisions between former allies within Civic Forum and Public Against Violence affect the work of the federal government.	Low. Disintegration of Civic Forum and Public Against Violence in early '91 leads to 15 parties in the Federal Assembly. The parliament is fragmented and deeply divided along party lines.
Hungary			
Antall (March'90-present)	October 21, 1991 Central Bank Legislation. November 13, 1991 Banking Legislation passed.	Divided. Coalition government between Hungarian Democratic Forum, Independent Smallholders' Party and the Christian Democratic People's Party. Cabinet reshuffles in Dec'90 and Jan'91 over pace of economic reform. Relations between the coalition partners deteriorates during '91. Parties also experienced internal strains.	High. Alliance of Free Democrats, despite experiencing some internal splits, retains seats in the parliament and serves as a vocal opposition.
Poland			
Mazowiecki (Sept'89-Dec'90)	December 28, 1989 Central Bank and Banking legislation passed.	Insulated. Solidarity hold all six ministries overseeing the domestic economy. Toward the end of '90, Solidarity splinters.	Low. Elected under the old regime, parliamentary opposition is discredited and in disarray.
Bielecki (Jan-Oct'91)		Divided. Solidarity is factionalized, while Walesa, elected President in Nov '90, attempts to make his office the center of decision making at the expense of the government and the Sejm.	Low. See above.
Olszewski (Dec'91-March'92)	March 1992 amendments to Banking legislation passed.	Divided. After protracted negotiations, an agreement is reached whereby the executive consists of members of three parties and several independents.	High. Twenty-nine political parties achieve representation in Oct.'91 elections.

Romania			
Ilescu/ Roman (June'90-Sept.'91)	March 1991 Central Bank and Banking legislation passed.	Divided. Intraparty divisions lead to government shake up in April '91, including dismissal of Finance Minister. During the course of '91 the economic policies pursued by faction of NSF supporting Roman met with considerable resistance from the party's more conservative elements.	High. Umbrella opposition organization National Convention for the Establishment of Democracy (NCED) established in Dec. '90.
Armenia			
Ter-Petrossian (Aug '90-present)	Central Bank and Banking legislation passed in December 1992[2].	Insulated. Feb '93 Ter-Petrossian consolidates power with Oct '91 election to post of president.	High. Parliament lacks single majority. Armenian Nationalist Movement (AMN) has largest support, but still hold only 1/5 of the seats. Opposition grows through the year. By June '92 opposition party Dashnaktsutia merges with other opposition parties to form National Unity. Parliamentary deadlock occurs.
Azerbaijan			
Mutalibov (May '90 - Aug '91)		Insulated. Supreme Soviet elects Mutalibov president in May '90.	Low. Until August coup attempt, opposition holds only 40 out of 350 seats in the Supreme Soviet.
Mutalibov (Sept'91-March'92)	Banking system governed by Presidential decree of February 12, 1992, until August 7, 1992.	Divided. Conflicting jurisdictions between Supreme Soviet, National Council and Presidency inhibits consistent and comprehensive adoption of reforms.	High. 50% of National Council seats filled by ANF supporters. Opposition forces resignation of Mutalibov in March '92.
Belarus			
Kebich (Aug '91)	Central Bank and Banking legislation passed Dec. 14, 1990.	Insulated. Kebich's government is staffed by ministers drawn from former Central Committee. Except for replacement of Supreme Soviet chairman Dementei by Shushkevich, most communists retain old positions despite Aug. coup attempt.	Low. Approximately 20% of Supreme Soviet deputies occupy senior positions in the government. 75% are members of Communist Party. Opposition active, but numerically very small.
Estonia			
Savisaar	Single piece of banking legislation passed Dec. 89.	Insulated. Savisaar is appointed as chairman of the Planning Committee in the autumn of 1989 and takes control of formulation IME (Self-Managed Estonia) initiative.	High. Economic planner come into conflict with government over path of economic reform. Conflicts also develop between Supreme Council and the Planning Committee.
Georgia			
Gamsakhurdia (May '91-Jan'92)	Central Bank and Banking legislation passed August 21, 1991.	Insulated. Gamsakhurdia, chairman of parliament following Oct '90 elections, consolidates power with May '91 election to post of presidency.	High. Intellectuals increasingly oppose Gamsakhurdia's drift toward authoritarianism
Kazakhstan			
Nazarbayev ('90-present)	Single law governing banks passed on January 18, 1991.	Insulated. Nazarbaev elected president by Supreme Council in Aug '90 and by popular vote in Dec. '91. The coordination of economic and financial policies are being concentrated in the President's office.	Low. Socialist Party of Kazakhstan, the former Communist Party, hold a 70 percent majority in the Supreme Council. Opposition is fragmented.

Kyrgyzstan			
Akaev (Oct'90-present)	Central bank and banking laws approved June 1991.	Insulated. A major reform of the Government structure in Feb. '92 pared down the number of ministries and deputy prime ministers. Ministry of Finance and Gosplan merged into Ministry of Economy and Finance. A single deputy prime minister is in charge of economic affairs.	Low. March '90 elections bring in overwhelming single party majority. Kyrgyzstan party, a large umbrella group of many factions, is the dominant political party and supports Akaev.
Latvia			
Godmanis ('90-'93)	Single piece of banking legislation passed July 1990. Central bank and banking laws passed May 19, 1992.	Divided. Tensions exist between the Council of Ministers' commission on economic reforms, which includes ministers of economics, finance, agriculture, industry and justice and directors of departments under the Ministry of Economics and the Council of Ministers, and parliamentary Economics Commission.	Low. 2/3 of the deputies belong to the Popular Front faction. Small number of small parties which fall into two broad categories: those allied with the goals of the Popular Front, and the opposition, made up largely of former and current CPSU functionaries under the Ravnopravie rubric. Parties and coalitions form and reform, but broad support for government remains strong.
Lithuania			
Landsbergis/ Prunskiene ('90- Feb '91)	Single piece of banking legislation passed February 13, 1990.	Divided. Unclear delineation of powers between the parliament and the government. Prunskiene government forced to resign Feb. '91. Her replacement, Vagnorius, experiences growing number of disputes with parliament over jurisdictional issues during '91.	High. Sajudis remains an umbrella organizations. Seven major factions exist. Splits between the three which comprise the unofficial ruling coalition increase the opposition's strength.
Moldova			
Snegur ('90-	Single piece of banking legislation passed June 11, 1991.	Insulated. Parliament turn government into cabinet of ministers largely subordinate to the presidency in May '91.	Low. Popular Front goes into opposition against Snegur presidency, but is beset by declining support. By the end of '91, PF holds only 30 parliamentary seats, down from 140 the year before.
Russia			
Yeltsin (March '90-	Central Bank and banking legislation passed December, 1990.	Insulated. Supreme Consultative and Coordinating Council of the Chairman of the Supreme Soviet of the RSFSR, comprising 22 reformist intellectuals, including many economists, set up. Yeltsin elected to post of presidency in June '91.	High. Opposition from speaker of parliament, Khasbulatov, and most deputies within Supreme Soviet.
Tajikistan			
Makhkamov ('90-Aug '91)	Central Bank and banking legislation passed Feb. 1991.	Insulated. Nov. '91 Nabiyev consolidates power by winning popularly elected post of president.	Low. Opposition parties are not allowed to run in the Feb.'90 elections. 94% of elected deputies are communists. (Communists forced from power shortly after Aug. coup, but regain control by end of the year.)
Turkmenistan			
Niyazov ('90-present)	Presidential decrees issued in January 1992 govern central and commercial banks.	Insulated. Niyazov named president by Supreme Soviet in late '90. Economic policy is under the direction of the Economic Committee in the Presidential Council. The State Committee on Planning (Gosplan) remains in force .	Low. Opposition groups have been banned and were forbidden to field candidates in the '90 elections.
Ukraine			
Kravchuk (March '90- Dec.. '91)	Central and commercial banking laws passed April, 1991.	Insulated. Kravchuk chosen chairman of Supreme Soviet in summer of '90 and is popularly elected to presidency in Dec. '91.	Low. Communist win 2/3 of parliamentary seats in '90 elections. Rukh holds approximately a quarter of the seats.

Uzbekistan

Khabibulayev ('90-Aug. '91)	Single banking law passed in February, 1991.	Insulated. Supreme Soviet elects Karimov to post of presidency in '90. He chooses a cabinet of ministers to administer the government. Karimov elected to presidency by popular vote in Dec. '91.	Low. '90 elections were tightly controlled and leave complete control of the legislative body to the Communist Party. Birlik and other opposition groups are without representation.

---

[1]1992 Bulgarian banking law was drafted under Popov administration.

[2]For the period under consideration, Armenian banking system is governed by old USSR laws and ad hoc policies.

Appendix II: Derivation of the Selectivity Index

A. Direct and Selective Controls
   1. Credit granted according the government plan
      yes=1; no=0
   2. Preferential refinance rates
      yes=1; no=0
   3. Bank by bank credit limits
      yes=1; no=0
   4. Interest rate floor or ceiling controls
      yes=1; no=0
   5. Control over spread of interest rates
      yes=1; no=0

B. Refinance or Discount Rates
   1. Frequency of change
      less than once per year=.5
      1-2 times per year=1
      3 times per year=1.5
      4 or more times per year=2
   2. Different rate according to time
      yes=1; no=0
   3. Quantitative limits on overall credit
      yes=1; no=0

C. Open Market Operations
   1. Use
      planned=.5
      insufficient government securities=1
      growing importance=1.5
      used as a monetary instrument=2

D. Reserve Requirements
   1. Frequency of change
      less than once per year=.5
      1-2 times per year=1
      3 times per year=1.5
      4 or more times per year=2
   2. Differentiated according to maturity of deposits or use
      yes=1; no=0
   3. Control of asset composition
      yes=1; no=0

Each country's total number of points under Direct and Selective controls was multiplied by 1.5 to reflect the greater selectivity of such instruments. After summing the values for each entry, I subtracted 1.5, the theoretically minimum number of points, and divided the new total by 16, the maximum number of points minus 1.5. In this way, the selectivity index represents a percentage of the maximum possible selectivity, while taking into account the necessity of some governmental intervention.

Panel 39-4: "Psychological Aspects of Transformational Political Movements" Prepared for delivery at the 1993 Annual Meeting of the American Political Science Association, Washington, D.C, September 4, 1993. Copyright American Political Science Association.

The "Green Movement" is a worldwide coalition of grassroots activists who share a concern for both environmental and democratic governance issues. European Green parties often speak about standing on Four Pillars – environmental balance, social justice, non-violence, and grassroots democracy. Greens played a role in overthrowing the centralized regimes controlling the Soviet Union and Eastern Europe. Green parties have elected local and national representatives in Germany, Finland, Ireland, the Netherlands, Belgium, Sweden, Austria, Italy, Luxembourg, France, Switzerland, Portugal, Bulgaria, Rumania, East Germany and the former states of the Soviet Union, to the European Community Parliament, and in New Zealand and Australia.

Official Green parties are just getting on the ballot in the United States. In 1990 the Green Party of Alaska elected two Greens to municipal offices, and ran a full slate of candidates in 1992. In 1992 Greens achieved official party status in California, Hawai'i, Arizona, and New Mexico. Hundreds of Greens ran for public office, and 53 were elected in 1992.

Optimists see these newly formed U.S. Green parties as a vehicle for a new and different form of politics, based on a unique blend of environmentalism, social justice, and participatory democracy. The worldwide rising of Green parties is seen as the political expression of a "new paradigm" of values appropriate for meeting the challenges of living on this planet in the 21st Century.[1]

Skeptics, however, see the American Greens as simply another chapter in this nation's long line of minor Third parties who flash brightly for an election or two, then fade away as mainstream parties adopt their innovative ideas.

The Woolpert and Halpern papers presented in this panel raise troubling questions about the psychological dynamics often expressed in transformational groups that may substantially

08/03/93 23:10 808 732 5497 ROHTER PAGE 03

impede the success of Green parties.[2] They follow the style of theorizing first established by Harold Lasswell in his classic work *Psychopathology and Personality*, and continued by McClosky, Lane, Greenstein, etc.[3]

Although I am sympathetic to their psychological analyses of individual members – I was one of the founding members of the Psychology and Politics Association – I think the psychodynamic approach can easily become too reductionistic. I intend to examine the question of the U.S. Greens' future largely in terms of their ability to successfully solve critical strategic, tactical, and organizational issues. This will set the context for an examination of the psychodynamic issues identified by Woolpert and Halpern that might affect the ultimate success or failure of the U.S. Greens.

An epistemological note: I wear two hats as I write this paper – as a professor of political science at the University of Hawai'i, and as one of the founding members of the *Hawai'i Green Party*, of which I am presently one of its State Co-Chairs.

STRATEGIES & TACTICS

WHO WILL VOTE FOR GREEN CANDIDATES?

The most basic question confronting the U.S. Greens is "What long term strategy will broaden the Greens' support, and allow them to win more political offices?" A sharper question is "Who exactly do Greens want electoral support from, and what kind of persons do they want to run as candidates?" Although traditional campaign organizations start their strategic thinking asking these questions, too many Greens, surprisingly, seldom explore them in any focused way. The U.S. Greens speak in many voices, ranging from leftists who talk about organizing non-voters, dis-empowered citizens, and the working class, to those who want to appeal to a broader middle-class, whomever that might be. Other Greens are intensely single issue oriented, and promote legalizing hemp, or animal rights, stopping nuclear powerplants, military spending, hydopower dams, toxic dump sites in their communities, etc.

Exactly who then can Greens expect to vote for their candidates? Is it the "Post-materialist rising new class" of educated, professional service workers in an industrialized society, as political scientists like Inglehart argue?[4] In advanced industrial democracies, issues are moving away from a class-based materialist orientation toward a more quality-of-life, participatory emphasis. Is this "new class" really voting for Greens? Are there other segments of the voting population that are attracted to Green issues?

Too many Greens are more interested in writing the perfect platform document and organizational bylaws, and achieving perfect gender-fair and consensual processes in their group, than in asking these kinds of hard political questions.

08/03/93 23:10 808 732 5497 ROHTER PAGE 04

ISSUES

Many voters view Vice President Al Gore as an "environmentalist" and believe the Clinton administration is promoting a strong environmental agenda.[5] The soon to be revealed Clinton health-care proposals appear as a major program to set this country's medical system aright. The Clintonites are trying to advance many programs that Greens advocate, such as establishing community-development banks, sustainable agriculture programs, a BTU energy tax, environmental clean-up and protection, educational reforms, advancing gay and civil rights, promoting feminist issues, etc.

What issues remain for the U.S. Greens to advocate? Duplicate these positions at lower governmental levels, or stake-out areas that have been overlooked? Will American Greens end up being just Reformers, operating as a "green wing" of a reborn Democrat party? Perhaps the Clinton initiatives will not be passed, or effectively implemented.

Or, can the Greens stake out substantially different positions that will clearly differentiate them from liberal Democrats? One possibility is for Greens to advocate much more extreme positions, such as radical gay rights and feminism, strident leftist economics, Earth First style environmentalism, animal rights, etc. While these positions may be important to various single-interest groups, espousing them as though they comprise the core beliefs of the Greens seems the path to political marginalization.

Rather than being a shopping list of radical and politically-correct (PC) positions, the Greens offer a holistic analysis that gets to root causes of America's problems and advocates fundamental structural and attitudinal changes. Are not Gore and Clinton's programs just a light shade of green, at best, offering no more than superficial reforms? They certainly are not challenging the fundamental premises of our modern society: more growth-is-good, capitalism is the best form of economics, we can significant change our environmental practices without requiring us to alter our basic style of living, technology is our saviour, consumerism is what life is all about. Greens need to communicate their alternative ideas about a more democratic economy, meaningful and decent paying work, a deeper appreciate of ecology and stewardship, cultural- and eco-feminism, less consumerism, revitalizing community life, and re-establishing citizen-based governance.

The likely failure of the Clinton presidency to implement significant environmental, health care, and campaign reforms, and restructure the economy, will support the Green's argument that radical change and not incremental reform is needed. Despite many progressives' relief over the defeat of Bush, and hopes for the changes the Clintons promised to deliver, believers in change are slowly realizing that the Clintonites cannot reach their lofty goals. Clinton and his band of supporters lack the political capacity to break through the national gridlock created by the connections between powerful Congressmen and interest groups.

Greens must set out clear difference between old and new paradigm values, and find ways to make them understandable and politically palpable to an ever-widening constituency. Greens must build grassroots groups who can pressure their legislators and elect better ones.

08/03/93 23:10 808 732 5497 ROHTER PAGE 05

A local-first strategy both matches the Greens' limited resources and ideological view of proper governance: work from the bottom up.

ALLIANCES AMONG AFFINITY GROUPS

The classic political tactical question might be posed as: "How can U.S. Greens build alliances with sympathetic groups and voters?" The German Green Party, *Die Grunen*, has its roots in the coming together of an unusual association of conservative farmers, progressive ecologists, and anti-nuclear powerplant opponents. This coalition was later joined by veterans of the 1968 radical students movement, members of the peace movement mobilized against deployment of intermediate-range nuclear missiles in Europe, and various Left parties turning green.

In the American context, this means U.S. Greens need to craft programs that draw electoral support from environmental, peace, feminist, and social justice advocates, and then broaden out to draw in home renters, native rights activists, farmers, labor, mainstream women's organizations, etc. To be successful the U.S. Greens must write platforms and policy papers that appeal to as many like-minded interest groups as possible.

THE GREENS AS A VIRTUAL ORGANIZATION. I believe this traditional model of political organizing is inappropriate given the Greens' limited resources, and is based on obsolete concepts. U.S. Green party groups need to think of themselves more as networks than formal organizations. Organizations have permanent hired staff and offices, and a centralized chain of command. Networks are informal and voluntary and self-organizing. They lack formal headquarters, permanent leaders, or a rigid chain of command.[6] People voluntarily organize around specific issues, choose task-specific coordinators, find volunteers to do things, and freely exchange information by decentralized technologies such as copy machines, telephones, faxes, and electronic and regular mail. Organizations are legal structures that are funded by donations, grants, membership dues, and government contracts. Networks have little funding and volunteers usual pay their own expenses.

This new style of organization is emerging rapidly in the business world, and has been called Virtual Organization.[7] The term "virtual" is drawn from world of computers, and describes how the machine acts as if it had far greater storage capacity than it actually possesses. A Virtual organization appears to an outsider observer as a single entity with vast capabilities, but in reality it really is a shell holding together numerous collaborations assembled only when needed.

Greens in other words should not limit themselves to "drawing support" from sympathetic groups and their members. Instead Greens parties can serve as the legal and organizational shell for existing green-oriented groups to function effectively in the electoral arena. Greens should be actively creating coalitions of existing groups that will jointly formulate shared policy positions, influence legislators and bureaucracies, and run candidates for elected office. Viable "Green" candidates with proven leadership ability and experience will come from these

groups. Green parties in the U.S. as themselves have neither money or legions of grassroots supporters; it will take a coalition of established groups, who together have resources, to influence policy makers and run successful electoral campaigns.

We Greens in Hawai'i, for example, are always being asked: "Who are YOU going to run for Governor or City Council or . . . in '94?" I always answer: "Who do you think WE, the activist coalition, should jointly nominate and support?"

In this sense U.S. Green parties are really virtual organizations or networks. They constitute the minimal structure or formal organization that is needed to meet legal requirements, and their job is to maintain a network of collaborative relationships between already existing groups. The Greens' limited resources do not allow them to "organize" the downtrodden masses. The small band of diligent members who keep the Green network alive can help embryonic grassroots activists organize their communities, mostly with advice on political strategy and help in networking with other groups, but it is simply beyond their capabilities to do intense community organizing and run a political party.

TACTICAL ISSUES

Choosing Winnable Races and Viable Candidates

Winning political offices in the United States is a daunting challenge, much harder than in Europe, where proportional representation allows Greens to be elected with only small percentages (5%) of the total vote. Since races in the U.S. for higher offices allow only one candidate to win, Greens have to carefully select which races they should contest. Many Greens are political amateurs, and seem too willing to run holy crusades directed towards making symbolic points, rather than engage in careful pragmatic targeting. To run candidates in many races dilutes already limited resources, and Greens need to target selected races where they have a decent probability of winning. The *Hawai'i Green Party*, for example, in their first election in 1992, sought to target races where they had both activist groups within the district to draw support from, and whose incumbent officeholder was not very popular.

High visibility state-wide races can, however, be vehicles for gaining media attention and produce a "Trickle-down" benefit for local Green candidates. These races also provide creditability for the party and help educate the voting public on Green ideas.

The concept of "fusion" campaigns is another tool Greens can utilize in their election strategy. Social justice, feminist, environmental, and grassroots-democracy groups can work together to come up with a list of candidates to support who share common ideals and choose to run as Democrats, Republicans, or Greens based on tactical considerations. On the Island of Hawai'i, for example, Greens helped to elect two independent Republican Councilmen, who later joined with the Green Councilwoman and an independent Democrat to form the minority faction in a 5 to 4 split Council. Many Green agenda items are being advanced by this informal alliance. What makes the alliance even more effective is the knowledge that more than 27 percent of the Big Island voters cast their ballots for the Green mayoral candidate in

08/03/93 23:10 808 732 5497 ROHTER PAGE 07

'92 – more than double the votes garnered by the Republican. Any aspiring mayor will have to win the Green vote!

A related tactical question is the "kind" of candidate Greens should run. Too often, people come out of the woodwork as candidates. They are either solo renegades, or associated with single-issue causes. I would suggest several criteria be used to evaluate "viable" candidates. Do they have the breadth of holistic vision that Greens stand for? Can they speak knowledgeably about the many Green solutions to the community's problems? Do they have relevant leadership experience; that is, do they appear to be knowledgeable and have demonstrated competence in working with others? Are they known in the community? Do they come with recognition as community or issue-based leaders? What community groups are they involved in? Do they intend to run a serious campaign designed to win? Are they willing to make an all-out commitment of their personal life for several months?

Changing the Political Structure

Minor parties are greatly disadvantaged by the America majority vote system. The hundreds of Greens who hold elected offices in Europe do so only because their systems allow proportional representation, so that minority viewpoints are represented. If non-conventional views are to be represented, the winner-take-all American electoral system must be altered. Unfortunately this winner-take-all concept is so deeply imbedded in the average American's consciousness as an unchallenged assumption that it will take years to change. We can perhaps approximate proportional representation by working for multiple member districts, smaller-sized districts, home-rule for towns and urban neighborhoods, etc.

Using Media Effectively

How can Greens creatively use the media and other forums for presenting their ideals? New candidates – and especially ones with fresh ideas – need to get themselves heard. In small districts walking the neighborhood or community and talking to people face-to-face is one tool used by newcomers. In larger districts, teams of canvassers can carry a candidate's message to the voters' homes. But in the absence of an army of volunteers, and in huge districts, newspapers, radio and television become the major form of communication.

Greens have become clever in obtaining some free news coverage. They also have worked hard at appearing at public voter forums, or participating in debates, as often only the "major" parties are normally represented. But they find it difficult to get their press releases printed, or press conferences reported. The media centers its attention on the major name contenders and offices, and only reluctantly covers the "other" candidates and local races. Paid ads in newspapers and radio are a necessary tool for a large-scale viable campaign, and unless Green candidates are capable of raising large sums of money for this advertising, they are at an enormous disadvantage in getting their ideals heard by the public.

Greens therefore should, during off-years, be vigorously pushing for a number of campaign reforms, such as abolishing paid TV and newspaper political advertising, getting public funding for forums and debates to publicize candidates' stands on issues, promote the

08/03/93 23:10 808 732 5497 ROHTER PAGE 08

distribution of *voter information booklets* before each election containing candidates' background and position on major issues, and information on initiatives, charter reforms, etc.

Fund-Raising: the Unsolved Challenge

European Greens get nearly all their income from generous state subsidies. These substantial election reimbursements pay for running party organizations and election campaigns. Winning officeholders – which occurs easily given low proportional representation threshold-levels – also receive paid staff and day-to-day expenses.

American Greens do not enjoy the luxury of paid professional staff and campaign funding. Green organizations, like most volunteer-based groups, are funded largely out-of-pocket and through small fund-raising events. Campaigns are run largely on shoe-string budgets, or from loans. Even in a small state like Hawai'i we estimate a decent legislative or council campaign requires at least $10,000 to $12,000. A *serious* statewide race might require a minimum of $200,000 for large numbers of potential voters to hear what a Green candidate stands for. Guerrilla media tactics are not enough to get proper exposure. An alternative to such large spending is mobilizing an army of unpaid volunteers.

Greens embrace the ideal of citizen-based politics, and believe there are legions of volunteers just waiting to march forth to carry the Green message far and wide. Well – I'm still waiting for this to happen! What I do see are small numbers of committed souls – usually family and close friends of the candidate – working their butts off and often paying for their campaign literature from their own pockets.

Can Greens raise enough money to run serious campaigns, when they lack good access to the usual sources of major campaign funds – big business, big labor, etc.? As challengers to the status-quo, what do the Greens have to sell?

To take the Hawai'i example, if we limit campaign contributions to $250 per individual, where will 50 or more large contributors *per district* come from? Or a hundred smaller ones? For Governor, who will elicit the support of nearly 1,000 contributors? Despite their rhetoric about being grassroot-based, I've seen no Green groups anywhere get close to meeting their organizational and campaign needs. Unless Green groups can raise modest amounts of funds and enlist the support of large numbers of volunteers, they will always be relegated to "also-ran" status.

PARTY ORGANIZATION

Greens pride themselves on being grassroots democrats. They have attempted to transplant the ideals and aspirations of movement politics and small group dynamics into the bureaucratic political structure of our modern industrial state. Green citizen-based organizations (the "anti-party" as some put it) are supposed to be characterized by (1) a low degree of formalization, (2) dominance of the grassroots over higher-level functionaries or

08/03/93 23:10 808 732 5497 ROHTER PAGE 09

elected officeholders, and (3) a strong emphasis on linkages with grassroots social movements. Germany's *Die Grunen* promoted these ideals, for example:

* Democracy means control comes from below. Elected representatives are directly accountable to local groups; positions arrived at in lower-level meetings govern their representatives' votes.

* Representatives rotate office every four years, to guard against entrenched incumbency. There are a few exceptions: in instances when 70 percent of constituency group approves, office-holders can continue in their positions for additional terms.

* Positions of responsibility are rotated often. Multiple office-holding is forbidden; no individual party leader can control several positions.

* Major decisions are *not* made by central steering committees of core activists. Instead, state chapters are autonomous, with state-wide policy decisions ratified at large assemblies of delegates. Many activities are initiated by affinity groups (women's, peace, and bio-regional groups) and coordinated on a state-wide basis by rotating spokespersons.

* Consensual decision-making processes, and not quick votes, are encouraged. Minority points of view are voiced, and accommodation sought. Admittedly seeking consensus is not the most efficient way to operate in terms of time and reaching decisions quickly, but it assures every member a role in determining the group's course of action. Politics builds understanding and empathy, and closer relationships rather than estrangement.

THE REALITIES. The major question then, is: "What models of party organization are compatible with Green values of decentralization and consensus building, yet allow timely and efficient decision-making?" Greens have found these ideals difficult to achieve, even in Europe where they are comparatively well funded and citizens are often well informed. Although the Green ideal is to establish open communications and participation with a large membership, U.S. Greens, like most grassroots groups, find themselves forced to operate with severely limited resources. They are almost totally dependent on voluntary labor, and have minimal funds for communications, duplication, travel expenses for local representatives to travel to regional meetings, etc.

While Greens emphasize maximum citizen participation and involvement, politics operates in real-time. Quick decisions often must be made to take advantage of fast-breaking public events. Responding to a scandal, or some action of the State or business, requires quickly put together press releases, news conference, and plans for mobilizing actions. How can "the membership" be engaged in deciding what exactly is said or done on behalf of the Green Party?

This need for quick yet authoritative decision-making is even more acute during election periods.

Some situations do allow for a more leisurely process, where information can be shared by mailings, meetings held and votes taken. If consensus is not easily reached, then more talking-it-out can occur. Writing platforms, policy papers, and bylaws can be done in accordance in Green organizational ideals.

Just exactly WHO? is to participate is another major unresolved question for U.S. Greens. Within any chapter, only a small group – the steering committee and kindred souls – runs day to day affairs. A larger number (though still few) show up to talk and vote at public meetings, but are mostly uninvolved otherwise. During elections another cluster of people appear who work on the campaigns by waving signs, contributing small amounts of money, passing out literature, canvassing, etc.

Green ideals say whoever shows up at a meeting has an equal voice. But in practice some sort of "seasoning" process needs to be applied to "qualify" decision-makers. Should not being well-informed, adhering to Green values, and demonstrated responsibility to the Party all play a factor in judging each member's role in decision-making? Should a candidate for U.S. Senate have her campaign tactics and statements and leaflets voted on by total membership votes? How much discretion do candidates, or elected Green leaders, have in their roles as spokespersons for the Greens?

The issue of voting, consensus, and requiring super-majorities for decisions is another area of great debate among U.S. Greens. Some state and local groups require a 80% approval before any policy can be approved. This requirement for consensus decision-making has often impeded party effectiveness.[8] Some groups have found themselves paralyzed in seemingly endless debates on policies. Both Hawai'i and Alaska groups – and others I'm sure – fall back on simple majority votes on most questions, though still demand a 2/3rd proportion on major issues such as bylaw amendments.

A few groups are exploring ways that new technologies such as E-mail, electronic bulletin boards, and fax broadcasts can enhance membership involvement in policy discussions. These devices have become essential tools for leaders. The old bugaboo about limited access to these technologies is the downside to this solution. Experiments in publicly funded computer terminals in Santa Monica and Hawai'i offer new potentialities for greater citizen participation in public policy-making. Private corporations are rapidly connecting their employees by e-mail systems that allow interactive decision-making too. I see some possibilities here, but frankly this gets us into the electronic democracy and tele-democracy material that in many respects is the antithesis of face-to-face democracy.

My guess is U.S. Greens will continue to muddle-thru, and try to strike a balance between getting-the-job done and ideals of participation. Those groups who have actually elected Green candidates, and try to support them in office, will struggle with this issue constantly. One important structural antidote to centralized power, is the creation of citizen-based taskforces and working groups that involve widely-representative members of the local community and government at all levels in solving important community problems. Having so

many citizen groups working on festering issues involving housing, transportation, the environment, social justice, women's concerns, economic conversion, etc. shares important information and allows fresh viewpoints to be heard and validated.

CAN STRUCTURAL BARRIERS BE OVERCOME?

The U.S. Greens face incredible challenges to their creating of a successful third party. The American political structure burdens them with a winner-take-all election format. The present method of campaign financing advantages corporations, the wealthy, and well-organized special interest groups. The apathy and alienation of half of the electorate, and the entertainment-oriented form of television campaigning, makes it difficult to overcome the advantages held by incumbent officeholders and regular party candidates.

The Greens' success revolves ultimately about their ability to influence, and be the benefactors of, a process of national party realignment. This process will have to entail: (1) a weakening attachment between voters and regular parties; (2) a significant increase in mass political participation; and (3) a crystallization of new party alignments based on new social divisions.

The kinds of questions about individual psychologies raised by Halpern and Woolpert must be set within these larger political and social contexts. How well Greens meet these challenges will be effected by their courage and cleverness, willingness to balance their ideals with practical day-to-day political demands, and perhaps a bit of luck.

Greens must remember the distinction between being an electoral party and a social movement. Lots of reality intrudes if they want to be a party that seeks to influence government in a significant way. Unlike Euro-greens who can win elected office if they receive only 5% of the vote, American-Greens must reach out to a mass public if they want to win in a first-to-the-post system. Greens must appeal to a broader audience, and not be labeled as "fringe" players. They must address questions that average citizens are concerned with, such as decent paying jobs, affordable homes, safe neighborhoods, good health-care, quality schooling, etc. Greens must speak like knowledgeable policy-makers. They must package their idealism into concrete solutions and understand the realities of political and bureaucratic processes.[9]

The U.S. Greens are in a transition, from being a protest movement and sculptor of idealist solutions, to being a political party that can win offices and influence policy-makers. The next election cycle or two will tells us whether the Greens are up to the challenge, or will remain a philosophical and debating society.

STATES FACE AIDS:
POLICY CHOICES FOR HIV-POSITIVE HEALTH CARE WORKERS

By

Mark Rom

Assistant Professor of Government and Public Policy
Georgetown University

Paper prepared for the American Political Science Association annual meeting, Washington, D.C., September 1993.

STATES FACE AIDS:

POLICY CHOICES FOR HIV-POSITIVE HEALTH CARE WORKERS

In 1991 the Centers for Disease Control (CDC) announced that a dentist in Florida had apparently transmitted HIV, the virus that causes AIDS, to a patient while providing her routine dental care.[1] Further investigation indicated that the dentist had also infected at least five other patients.[2] The federal government, responding to these announcements and the public hysteria they generated, enacted laws, offered guidelines, and issued regulations to reduce the chance that health care workers (HCW) could transmit HIV to their patients. In particular, Congress through P.L. 102-141 directed the states to adopt health care standards (by October 1992) equivalent to those written by the CDC or face the loss of their Public Health Service funding.[3] How would the states respond?

This paper attempts to explain these responses. First, it briefly reviews and critiques existing state policy choice models. Next, an alternative to these models, based on Gormley's

[2]CDC, "Update: Transmission of HIV Infection during an Invasive Dental Procedure - Florida," MMWR, 40 (18 January 1991): 21-27,33; CDC, "Update: Transmission of HIV Infection during an Invasive Dental Procedures - Florida," MMWR, 40 (14 June 1991): 377-81; CDC, "Update: Investigations of Persons Treated by HIV-Infected Health-Care Workers - United States," MMWR, 42 (7 May 1993): 329-37.

[3]CDC's guidelines are in U.S. Department of Health and Human Services, Public Health Service, Centers for Disease Control, "Recommendations for Preventing Transmission of Human Immunodeficiency Virus and Hepatitis B Virus to Patients during Exposure-Prone Invasive Procedures," Morbidity and Mortality Weekly Report, 40 (No. RR-8), July 12, 1991. Congress also required the Occupational Safety and Health Administration (OSHA) to issue standards for infection control in P.L. 102-170. The OSHA regulations, 29 CFR 1910.1030, became effective March 6, 1992.

"regulatory issue networks", is presented and elaborated. This model is then applied in a quantitative study of the state responses to P.L. 102-141. Implications and conclusions are then offered.

State Policy Choice Models

Numerous models have been developed to explain state policy choices. "Median voter" or "demand side" models, in which policy choices are determined by the preferences of the typical constituents, are one common form.[4] Other models have emphasized "supply side" effects, in which the self interests of public officials are seen as the main influence on policy choice.[5] Still other scholars have emphasized the features of a federalist system which leads states to compete or cooperate, rather than focusing on the intrastate characteristics stressed by supply and demand models.[6]

These quantitative models of state policy choices generally have several common attributes. First, state taxing or spending levels are most often the dependent variables; non-financial program decisions are studied much less frequently.[7] Second, the policy issue is

---

[4]The median voter label comes from Duncan Black, Theory of Committees and Elections, (Cambridge: Cambridge University Press, 1958). William C. Mitchell refers to these models as "demand based" in "Fiscal Behavior of the Modern Democratic State: Public Choice Perspectives and Contributions," in Political Economy, Larry Wade, ed., (Boston: Klujwer-Nijhoff, 1983).

[6]For competition, see Paul E. Peterson, City Limits, (Chicago: University of Chicago Press, 1981); Peterson and Mark C. Rom, Welfare Magnets: A New Case for a National Welfare Standard, (Washington, DC: The Brookings Institution, 1990). For cooperation, Andrew Skalaban, "Policy Cooperation Among the States: The Case of Interstate Banking Reform," American Journal of Political Science, 37:2, (May 1993), 415-28.

[7]With notable exceptions, of course. See, for example, Skalaban, "Policy Cooperation".

assumed to be constant across states; that is, all states face the same choice (such as to raise or lower taxes or spending). Third, the policy issues are decided by the legislature, not by the bureaucracy. Finally, the legislatures' choices are thought to be influenced by the socioeconomic or political characteristics of the state. Policy models with these attributes have proven very useful in predicting policy choices in the states: given the relevant state characteristics, variation in state taxing and spending levels can be explained with reasonable accuracy.

There are solid practical and methodological reasons for scholars to have devoted their time and attention to such policy choice models. As a practical matter, fiscal policy is enormously important. Fiscal policy, moreover, usually produces juicy (that is, broadly distributed, interval level) dependent variables ripe for statistical analysis.[8] Fiscal policy does not comprise the universe of state policy choice, however; states also make many regulatory decisions. State regulatory policies are harder to model than fiscal policies. While much fiscal policy consists of adjusting rates in existing policies, regulatory policy usually consists of selecting from a variety of policy options. The policy problems, and the policy options available to regulators, often differ from state to state; finding a metric useful for comparing these options is frequently difficult. Regulatory policy can be made by legislatures, bureaucracies, or both. The link between socioeconomic or political attributes and regulatory policy choice is often unclear. In cases where the policy issue varies across the states, where options differ in content, where multiple actors are involved in the decisions, and where potential choices are not easily linked to population attributes, policy choice models are less well developed.

---

[8]Dye notes for example that the interstate variation in state per capita tax revenues and per capita education, health, welfare, highway and total expenditures has remained virtually unchanged over the past several decades. Dye, American Federalism, 41-42.

Colby and Baker provide a typical example of the strengths and weaknesses of state policy choice models in their study of AIDS programs.[9] The authors present a statistical model regarding fiscal policy for AIDS. Using measures of party competition, political culture, revenue effort, per capita income, and unemployment they are able to explain about 60 percent of the variation in 1987 state per-case AIDS expenditures.[10] Regarding regulatory policy for AIDS, however, the authors summarize what the states are doing while noting simply that "some states attempt to balance [policy] concerns. Other states move more aggressively in only one direction, while still others remain legislatively inactive."[11]

Policy Choice for Regulatory Issues

Gormley has suggested an alternative approach to the state policy choice models that focus on fiscal policies. His "regulatory issue networks" framework explicitly recognizes that legislatures and agencies are often both involved in policymaking, and that the policy issue's characteristics can have an important influence on policy choice.[12] In particular, public salience and technical complexity are the main characteristics of the policy issue that affect policy choice. The salience of a policy issue is determined by the scope and intensity of political conflict it produces. A regulatory issue is technically complex to the degree it involves factual questions

---

[9]David C. Colby and David G. Baker, "State Policy Responses to the AIDS Epidemic," Publius, 18 (Summer 1988), 113-30.

[10]As often happens in policy choice models, the coefficients were not all in the direction predicted nor statistically significant. Their analysis is not entirely coherent; they claim that the number of AIDS cases is the most important variable for predicting total expenditures, but they omit this variable from their per-case model. Colby and Baker, 129.

[11]Colby and Baker, "State Policy Responses to the AIDS Epidemic," 116-17.

[12]William T. Gormley, Jr., "Regulatory Issue Networks in a Federal System," Polity, 18:4, (Summer 1986), 595-620.

that require specialized expertise to answer. Gormley contends that issue salience and complexity "shape the contours of regulatory politics" because they

> determine [who] will participate, when, where, and how...They affect incentives to participate, the choice of tactics, the selection of a forum, and the kinds of criteria that are invoked. The outcome of a conflict depends on many other factors...but once salience and complexity are established, the matchups are determined and the odds are fixed.[13]

Despite Gormley's prudence in noting that issue salience and complexity do not by themselves determine policy outcomes, he does suggest that these factors do indeed influence both the form (legislation or administration) and content of policy choices. Gormley uses the relationships between issue salience and complexity to create a four cell typology of regulatory politics (Table 1).

(Table 1 Here)

When issues are salient but simple, "hearing room" politics prevail. The main participants include politicians, the press, and the public. Politicians have incentives to act because the issues are too important to ignore and yet are simple enough to resolve through legislation. Resolutions indeed are usually in the form of substantive legislation, with the content determined by political coalitions. Bureaucrats do not play a decisive role in hearing room politics; politicians find little reason to defer to bureaucratic expertise when issues are not technically complex.

"Street level" politics emerges when issues are low in both salience and complexity. Politicians, the media, and citizens usually do not get involved in these issues. Decisions are

---

[13]Gormley, "Regulatory Issue Networks," 603.

made by the bureaucrat on the beat, with these policy choices reflecting the ad hoc judgments of these street level bureaucrats.[14]

"Board room" politics predominate when issues are complex but not salient. In board room politics, policy is typically made by a relatively small group of bureaucrats, professionals, and business groups. Politicians, judges, citizens groups, and journalists usually are not involved. Although the policy choices often reveal the participants' mutual preferences, disagreements among participants at times require compromise or expand into broader conflicts.

When issues are both salient and complex, "operating room" politics are prevalent. In operating room politics "competing values and interests collide, but nagging doubts about factual questions obviate against a purely political solution."[15] Citizens groups resort to "protest politics" unless they have the resources to hire their own professionals. Journalists provide extensive coverage focusing on human drama, not technical arcana. Politicians, when facing operating room politics, typically: 1) propose lots of substantive bills that don't get very far; 2) approve procedural bills (which does such things as alter organizational arrangements, set deadlines, and specify methods) instead. Doing so allows them to placate constituents ("we did something") without addressing the substantive issues ("we told someone else to handle it"). Because the politicians do not decide the substantive issues, upper-level bureaucrats, guided by their professional norms, constrained by their institutional environment, must. To be both politically and professionally acceptable, their decisions must be socially sensible and technically

---

[14]The phrase "street-level" bureaucrat, of course, comes from Michael Lipsky, Street-Level Bureaucracy: Dilemmas of the Individual in Public Services, (New York: Russell Sage Foundation, 1980).

[15]Gormley, "Regulatory Issue Networks," 611-12.

sound. As in an operating room, the bureaucratic "surgeons" must gain the confidence of their patients as well as heal them.

Gormley provides a theoretical model of regulatory policy choice and, although he does not test it, he does attempt to place various policy issues within the typology.[16] Other scholars have also attempted to use this model by categorizing policy issues. While judgmental classification is useful in illustrating the model, it is less helpful in testing it.[17] There are several reasons why it may not always be appropriate to categorize issues judgmentally.

Salience and complexity are continuous variables, not categorical ones. Most policy issues are not either simple or complex, inconspicuous or salient; they are more-or-less complex and salient. As a result, many issues do not fit cleanly into either category: how should advertising, broadcasting, utility, and telephone regulation be categorized?[18]

Yet even the issues that appear easy to categorize at first glance do not necessarily fall cleanly into a single category. For example, Gormley considers pornography a low complexity issue and nuclear power a high complexity one. This is surely correct in some obvious ways: it is much easier to make and inspect the former than the latter. But what matters for regulatory

---

[16]Gormley categorizes 42 policy issues in "Regulatory Issue Networks," Table 1, 600.

[17]If a researcher knows enough about a policy issue's characteristics to place it in the typology, the researcher also probably already knows the politics, participants, and policy choices. The question then arises: does the issue's characteristics determine its politics, or do its politics determine its characteristics? In other words, does the issue's salience and complexity determine its politics, or are salience and complexity inferred from these politics?

[18]Gormley puts each issue into a different cell in the typology. He contends that advertising regulations are high in salience and low in complexity; utility regulations are high in salience and complexity; broadcast regulation is low salience and complexity; and telephone regulation is low salience and high in complexity. Gormley, "Regulatory Issue Networks," Table 1, 600. Other analysts may categorize these issues differently.

politics is the political assessment of the salience and complexity. The differences in complexity between nuclear power and pornography seems accurate only when the former is defined in empirical, and the latter in moral, terms by the political actors. When the regulatory issue is defined politically in moral terms -- "Should we permit (pornography, nuclear power) to be produced?" -- then whatever inherent technical complexity exists is almost irrelevant. If the issue is conceived more narrowly in empirical terms, however -- "Is (pornography, nuclear power) harmful to human health and, if so, under what conditions?" -- then the issue becomes more technically complex, and specialized expertise does matter.[19]

Salience and complexity thus are affected by both objective and subjective factors. Some issues may be inherently more salient and complex than others, although, no doubt people will disagree about which ones are which.[20] But the subjective attributes of salience and complexity are at least as important for policy choice, because salience and complexity can be political resources. Political participants can increase the likelihood of obtaining the policies they prefer by defining issues in certain ways. For example, political actors who want to resolve issues through legislation (because they believe that legislation will favor their interests) will attempt to define the matter as salient but simple; those participants who prefer administrative resolutions may portray the issue as complex while attempting to suppress publicity about it. Note that,

---

[19]For example, experts do indeed disagree about the empirical consequences of pornography, and especially differing kinds of pornography.

[20]Gormley suggests some examples. In general, he argues, environmental, energy, transportation and finance issues are more complex than issues involving employment, commerce, consumer protection and housing. Energy, environment, employment, health, safety, and quality-of-life issues are more salient than those of transportation, commerce, finance, and communications. Gormley, "Regulatory Issue Networks," 601-02.

because subjective interpretations are important, salience and complexity are not necessarily independent dimensions. Political actors, in attempting to make an issue salient, may portray it as "It's just that simple". Similarly, regulatory participants may present the issue as highly complex in order to make it less salient, i.e., boring.

For both objective and subjective reasons, salience and complexity are not constant for regulatory issues, but can vary over time and space. Salience and complexity can vary under at least three conditions. First, the underlying (objective) conditions regarding the issue can change; for example, air quality regulation may become more salient or complex as smog worsens. Second, salience and complexity can changed due to a "catalytic event" that draws attention to the issue without affecting the underlying conditions. Catalytic events include rare or unpredictable events such as assassinations, plane crashes, and natural disasters. Even though these events do not usually change the world, they change the perception of the world.[21] Third, a policy entrepreneur might increase the salience or complexity of an issue, even if the underlying conditions have not changed, through adept marketing. In any one location, issue salience and complexity may vary over time; moreover, at any point in time, the salience and complexity of an issue may differ from place to place.

To the extent that salience and complexity are continuous variables, affected by objective and subjective factors, and shifting over time and space, it makes sense to measure them in order to understand the politics, participants, and policy choices of the regulatory issue. In particular,

---

[21]The objective probability that a psychopath would try to poison over-the-counter drugs (such as Tylenol) probably has not changed much over time. Once it happened, though, the event induced politicians and bureaucrats to take -- or at least investigate -- measures to increase the public safety.

measuring salience and complexity can help us test several hypotheses, for example:

* The more salient the issue, the more likely that politicians will make policy;
* The more complex the issue, the more likely that bureaucrats will make policy;
* The more salient and complex the issue, the more likely that politicians will enact procedural legislation and bureaucrats will adopt politically responsive rules;

A Model of Policy Choice for the HCW and HIV Issues

Gormley's "regulatory issue networks" model can be tested in part through an examination of state policy choices in response to P.L 102-141 regarding HCWs and HIV.[22] States could comply with this law in several ways with various policy instruments. State assemblies could enact substantive legislation that either adopted the CDC guidelines or set equivalent ones. Alternatively, state assemblies could explicitly delegate policy responsibility to administrative agencies through procedural legislation, or implicitly transfer these decisions through inaction. The administrative agencies, for their part, could also establish policies or delegate responsibility for doing so to others. State compliance could also come through three outcomes. States could certify that they have implemented the CDC recommendations, attest that they have adopted equivalent guidelines, or request a one-year extension in which to develop approved guidelines.

Before I attempt to explain these policy choices, however, a brief summary of them may

[22]Another article provided a qualitative case study of federal policy choices for the same issue. Mark Rom, "Health Care Workers and HIV: Policy Choice in a Federal System," Publius, forthcoming.

be helpful (Table 2).[23] All fifty states and the District of Columbia did receive their PHS funding for 1993 because the CDC approved their efforts at compliance with P.L. 102-141.[24] Delay was the most common form of compliance, however, with twenty four states asking for an extension. Twenty three states certified that they adopted "equivalent" guidelines (although equivalence varied from state to state), and only four states adopted the CDC guidelines in their entirety. Eighteen states, furthermore, enacted legislation in response to P.L. 104-141, while thirty-three states used purely administrative responses.[25]

(Table 2 Here)

The two questions a policy model attempting to explain state regulatory policy choices should answer are: 1) Why did states choose to make legislative or administrative responses? 2) Why did the content of the responses vary? In this section, I will address the first question; after that, the second.

The first part of the policy model will attempt to explain why states addressed the HIV and HCW issues through legislative or administrative initiatives. The dependent variable used to distinguish between these choices is coded "1" for states that enacted laws and "0" for states that have relied entirely on administrative procedures. Because the dependent variable is

---

[23]State policies were obtained through a mail survey of state health departments. Responses were obtained from all 50 states, and the District of Columbia. At the time of the survey, twenty four states had received time extensions from the CDC and so had not issued final regulations. Additional information on state policies was obtained from the AIDS Policy Center, Intergovernmental Health Policy Project, George Washington University. AIDS Policy Center, "A Summary of HIV/AIDS Laws from the 1992 State Legislative Session," January 1993; AIDS Policy Center, "States with Laws for HIV Infected Health Care Providers," October 1992.

[24]Henceforth the District of Columbia will be treated as a state in the analysis.

[25]Administrative policies were also used in the states that enacted laws.

dichotomous, logistic regression is used to estimate the probability of each state's choice.

State policy choices are expected to be influenced by the issue's complexity and salience. The salience of the HIV and HCW issue does fluctuate across the states. Salience can vary in three circumstances, as noted above. First, the underlying conditions regarding HIV and HCWs may differ from state to state. Second, some states will experience catalytic events, while others will not. Third, policy entrepreneurs will arise in some states but not in others. Measuring this variation is more difficult than stating why it might exist, unfortunately.

There is no obvious measure of "policy entrepreneuralism" in state legislatures. One might identify those legislators who introduced legislation as policy entrepreneurs, but then one has merely identified a component of the dependent variable itself.[26] A second possibility might be that the policy entrepreneurs on this issue in the states will tend to be conservative Republicans.[27] The measure used in this analysis is the presence of a Republican governor in a state (GOPGOV).[28] The hypothesis is that states with Republican governors would be more likely to enact legislation than states without Republican governors.

Identifying catalytic events is easier. The best candidate for a catalytic event is the public exposure of an HCW (especially a doctor or dentist) who treated patients after being diagnosed with AIDS. Just as David Acer and Kimberly Bergalis provided a catalytic event for Florida,

---

[26]The AIDS Policy Center has identified 22 states in which legislation concerning HIV and HCWs was introduced between 1990 and the end of 1992. Legislation may have been submitted in other states, but evaded the Policy Center's keen eyes.

[27]In the Congress, Republican Senator Jesse Helms and Republican Representative Robert Dannemeyer were the ones who initially introduced legislation regarding HCWs and HIV.

[28]"GOPGOV" is a dummy variable with two values: "0" if the governor was not a Republican, "1" if the governor was a Republican. Data from U.S. Bureau of the Census, Statistical Abstract of the United States, (U.S. Government Printing Office, 1992), 265.

HCWs in at least 5 other states have been involved in highly public "outings" (EVENT).[29] The hypothesis is that states experiencing catalytic events were more likely to pass laws than states without such events.

The final variable measuring salience involves the underlying conditions in a state. The most important condition might be objective probability of transmission of HIV from HCWs-to-patients. This, of course, is the great unknown. It might be roughly estimated by the prevalence of HIV among HCWs, but no data yet exists on this prevalence.[30] The prevalence of AIDS in a state, for which there are data, presumably mirrors the rate of HIV among HCWs and so could be used as a substitute. As the prevalence of HIV increases, so would the political salience of the HIV and HCW issue. HCWs, however, are generally interested in keeping this issue off the legislative agenda. As a result, it seems that the greater the concentration of HCWs in a state, the less likely that state would be to approve legislation restricting HCWs. Yet the overall impact of the AIDS rate and the HCWs rate on state legislation depends on the relative size of both these variables.[31] To measure the joint impact of AIDS and HCWs on the likelihood that a state would enact legislation, I created a variable (BALANCE) showing the HCWs-to-AIDS

---

[29]"EVENT" is a dummy variable with two values: "0" if a state has not had a catalytic event, "1" if it has. Six states (Florida, Maryland, Minnesota, New York, North Carolina, Ohio) were recorded as having catalytic events based on nationally-published reports in a variety of sources.

[30]Several states have started requiring HIV-positive HCWs to have their status reported to the public health authorities.

[31]To see this, ask whether a state would be more likely to enact legislation if the AIDS rate and the HCW rate both increased by 1 percent. As the relative size of these variables is unchanged, the state should note be more or less likely to enact legislation.

ratio.[32] The hypothesis is that states are more likely to enact legislation as BALANCE decreases (that is, as the AIDS rate increases relative to the number of HCWs); alternatively, states are less likely to approve laws as BALANCE increases.

I could think of no reason why objective complexity of the HIV and HCW issue would vary from state-to-state, and so did not attempt to include it in the analysis. The subjective complexity of this issue probably does vary across states.[33] Unfortunately, I could think of no practical way to measure this variation.[34] At the federal level, it seems that the HCW and HIV issues were politically defined as complex. In this paper, I will assume that it was also a complex issue for the states.

The variables measuring salience were the ones expected to have the largest impact on policy choice. Several other variables common to state policymaking models could also potentially influence policy choice and so were included in the analysis; it was not clear what

---

[32]"BALANCE" is calculated as the HCWs rate (the number of civilian doctors and dentists per 1,000 population) divided by the AIDS rate (the number of AIDS diagnosed per 1,000 population). This variable ranges between 5.9 for the District of Columbia, which has the highest rate of AIDS-per-HCW, to 491.1 in North Dakota, which has the lowest rate. Data on HCWs in 1990 from Statistical Abstract, 109. Data on AIDS in 1991 from CDC, "HIV/AIDS Surveillance Report," January 1992, 6.

[33]At the national level, politicians and bureaucrats grappled over complexity. Public health officials argued that the issue was complex, and that they should be allowed to make policy. Helms and Dannemeyer, among others, argued that the issue was pretty simple -- stop HIV-positive HCWs from treating patients -- and that Congress could and should make policy. Public health officials appear to have won the argument.

[34]One potential measure of complexity involves the ratio of expert-to-nonexpert witnesses (that is, credentialed authorities as compared with "regular citizens") at hearings. The greater this ratio, the more complex the issue. Because politicians control the witness list, this is one way that they can help define the complexity of the issue. A second, more easily obtained, measure concerns "bureaucratic professionalism". It is possible that more professional bureaucracies are better able to define issues as complex than non-professional bureaucracies. Reader comment on this point is especially welcome.

effect these variables would have on policy choice regarding HCWs and HIV, however. These variables comprised measures of economic affluence (PCI) as well as political ideology (IDEO), culture (CULTURE), and competition (COMP).[35]

The model used to estimate the probability that states had adopted legislation for HIV and HCWs took the logistic form:

$$P(LAW_i)=1/(1+\exp(-(B_0+\beta_1 EVENT_i+\beta_2 GOPGOV_i+\beta_3 BALANCE_i$$

$$+\beta_4 CULTURE_i+\beta_5 IDEO_i+\beta_6 COMP_i+\beta_7 PCI_i)))$$

Where:

P(LAW)	=	probability of enacting legislation;
EVENT	=	catalytic event (0 = No, 1 = Yes);
GOPGOV	=	Republican governor (0 = No, 1 = Yes);
BALANCE	=	Ratio of HCWs-to-AIDS in the population;
CULTURE	=	Index of political culture;
IDEO	=	Index of political ideology;
COMP	=	Index of political competition;

[35]Sullivan's "diversity index" (as updated by Morgan and Wilson) was the indicator of political culture. The "ideology index" developed by Wright, et al., was the measure of political ideology. Political competition was measured by the partisan distribution within state legislatures. Per capita income was the indicator of economic affluence. See David R. Morgan and Laura Ann Wilson, "Diversity in the American States: Updating the Sullivan Index," Publius, 20 (Winter 1990), 71-81; Gerald Wright, Robert Erikson, and John McIver, "Measuring State Partisanship and Ideology with Survey Data," Journal of Politics, 47 (May 1985), 469-89; Bureau of Census, Statistical Abstract of the United States, (Washington, DC: Government Printing Office, 1992), 266.

PCI = Per capita income;

$\beta_{0...7}$ = Logistic regression coefficients;

i = The 50 states and the District of Columbia.

Initial estimations indicated that political culture, ideology, and competition, as well as economic affluence, did not have an impact on policy choice.[36] None of these variables were statistically significant at the .50 level, and subsequently all were dropped from the analysis.

The final results from this model are presented in Tables 3 and 4. As these tables show, this model is useful in explaining state policy choices.[37] It correctly predicts 84 percent of the states' choice of legislation (12 of 18) or administration (30 of 33).[38] This represents a reduction in prediction error of 54 percent over a "naive" model that uses the modal vote as its prediction for all votes.[39] The individual variables are also statistically significant (Table 3) and substantively important (Table 4). States that had catalytic events, Republican governors, or a lower ratio of HCWs-to-AIDS in the population were more likely to enact legislation than states without those features. For example, North Dakota had an estimated 0.0 percent probability of

---

[36]The analysis was conducted with the logistic regression program in SPSS-PC+. A forward entry method was used, with the criteria for entry set at $p<.50$.

[37]The model chi square, 14.68, is significant at the .001 level.

[38]If the estimated probability of enacting legislation is greater than 50 percent, the state is predicted to have passed legislation; a state with less than a 50 percent probability is predicted to not enact legislation.

[39]The reduction of error (ROE) was calculated by the formula: ROE(%) = 100 * (predicted % - modal %)/(100 - modal %). See L. Marvin Overby, et al., "Courting Constituents? An Analysis of the Senate Confirmation Vote on Justice Clarence Thomas," American Political Science Review, 86:4, December 1992, 997-1003.

enacting legislation while New York had almost a 90 percent chance.[40] Of the three variables, EVENT had the strongest impact on the likelihood of legislative enactments.

(Tables 3 and 4 Here)

The probability that a state would enact legislation concerning HCWs and HIV increased as the political salience of that issue within that state increased.[41] Legislators grew more willing to act when the issue became politically salient. States where the political salience of HCW and HIV issues were low, in contrast, favored purely administrative policies.

State laws have also tended to be procedural, although some do contain substantive provisions (discussed below). The common element in all eighteen state laws is the delegation of considerable authority for making policies for HCWs and HIV to departments of health, medical boards, or some other panel.[42] The law in its entirety in several states (Mississippi, Maryland, and New Hampshire, for example) basically instructs some group or groups to develop rules and regulations regarding HCWs and HIV.[43] Minnesota's law, in contrast, specifies

---

[40]While the model as a whole predicted outcomes fairly well, it missed two states badly. Louisiana had an estimated 8 percent chance of enacting legislation, but did; North Carolina had a 92 percent probability of passing a law, but did not. Further research should reveal the specific reasons for these prediction errors.

[41]Mark Rom, "Health Care Workers and HIV: The Politics of State Policies," (Paper presented at the annual meeting of the Midwest Political Science Association, Chicago, 1993).

[42]AIDS Policy Center, "States With Laws for HIV Infected Health Care Providers," unpublished data, December 1993.

[43]Mississippi SB 2712, Public Law 381, 1992. Maryland has enacted two laws. The first (HB 194, Chapter 535, 1991) requires certain medical groups to develop a practice protocol for HIV-positive physicians. The second (HB 388, Chapter 154, 1992) is discussed below. AIDS Policy Center, "Laws for Health Care Providers with HIV Infection," 22 October 1992; AIDS Policy Center, "A Summary of HIV/AIDS Laws from the 1992 State Legislative Sessions," January 1993, p. 20.

policies for HIV and HCWs in considerable detail; yet even here significant discretion is delegated to administrative bodies.[44] In short: states where the issues were salient enacted legislation, and these laws tended to be procedural.

State legislatures may have hastened policy adoption. The states that enacted legislation appear somewhat more likely to have complied with the CDC guidelines than those states that did not ($\phi = .20$, $\chi^2 = 2.1$, $p<.15$). Forty-four percent (twelve of twenty seven) of the states with approved guidelines first enacted laws, while only twenty-five percent (six of twenty four) of the states asking for extensions had enacted legislation. Where the issues were salient, policymakers acted.

Policy Content

The states were required by P.L. 102-141 to adopt policies equivalent to the CDC's. The twenty-seven states with approved policies have defined "equivalence" in various ways. Why did these responses vary? We might expect that in states where the HCW and HIV issues were salient, policy choice would reflect the preferences of politicians (and the public). In states where salience was low, bureaucratic preferences may dominate.

In setting policy, states had to resolve four matters: infection control, practice restrictions, HIV-testing, and patient notification.[45] In general, the public preferred policies that were universal and mandatory, while health care professionals advocated selective and voluntary policies. The legislative and administrative policy choices in these states regarding these key

---

[44]A summary of Minnesota's law (SB 2732, Chapter 559, 1992) fills four single-spaced pages. AIDS Policy Center, "A Summary," pp. 16-20.

[45]See Mark Rom, "Health Care Workers and HIV: Policy Choice in a Federal System," Publius, forthcoming.

issues are summarized below.

Infection Control At the time that the states were making policies, OSHA issued sweeping regulations concerning infection control. These regulations presumably relieved (preempted?) states of having to make policies regarding infection control. At least six states nonetheless enacted laws specifically requiring HCWs to use universal precautions and imposing sanctions on those HCWs who do not.[46] Four other states also enacted legislation mandating certain HCWs to receive training in universal precautions as part of their instructional requirements.[47] The provisions mandating universal precautions do link the public and professional views: they recognize that infection control is a key to preventing HIV transmission (the professional view) and they mandate that HCWs must be compelled to (the public view).

The administrative responses are more puzzling at first glance. We might expect that state public health officials would embrace the professional preference for voluntary standards unless politicians expressed a clear preference for mandatory standards. In thirteen states thus far, however, these officials made universal precautions mandatory, thus exceeding the standards set by the CDC; fourteen states have chosen to leave infection control standards voluntary. There is no relationship between state laws and mandatory infection control standards (χ^2 =.42, p<.52). Public health officials in states that enacted legislation were not more likely to incorporate mandatory infection control practices than were officials in other states.

State bureaucratic responses make more sense in light of the OSHA regulations. Perhaps

---

[46]The states are California, Iowa, Maryland, Minnesota, Missouri, and Oklahoma. The sanctions typically involve revocation or suspension of license rather than criminal penalties. AIDS Policy Center, "A Summary".

[47]Delaware, New York, South Carolina, and Virginia. AIDS Policy Center, "A Summary".

the states that "chose" to make universal precautions mandatory were simply acknowledging OSHA's rules, while the other states revealed their non-binding preferences.[48]

Restrictions on Practice Most state laws delegated to various medical groups the power to make decisions regarding which HIV-positive HCWs may continue what practices under what circumstances. A few laws specified certain conditions that preclude HCWs from practicing.[49] No medical panel would have allowed HCWs to provide patient treatment in these circumstances, however. More difficult questions (such as whether HIV-positive but otherwise healthy HCWs may treat patients) are left unanswered. As a result, state laws appear to have taken an uncontroversial middle ground between public and professional views, making some easy decisions restricting HCW's practices while leaving the tough calls to medical panels.

State administrative policies have also delegated most decisions regarding practice limitations for HIV-positive HCWs to expert panels. Most of these policies go further by asserting that HIV infection alone does not justify limiting an HCW's duties, and that practice restrictions should be made on a case by case basis. HIV-positive HCWs generally are encouraged, but not required, to seek guidance from the relevant expert review panel. The absence of restrictions on HIV-positive HCWs clearly reflects professionals' preferences, regardless of the salience of this issue.

Testing HCWs for HIV Despite the broad public support for mandatory testing, no state has yet passed legislation mandating that HCWs be tested for HIV, although bills to do so have

---

[48]It was not impossible to determine which states had finalized their policies before the OSHA regulations. Several states explicitly refer to these rules in their own policies.

[49]Missouri and Texas, for example, have prohibited HCWs with exposed lesions from performing certain procedures.

been introduced in five states.[50] State laws, moreover, do not generally specify what kinds of HCWs should voluntarily determine their HIV status or how often these HCWs should have themselves tested.[51]

While state laws do not require testing, state administrative policies generally indicate that testing should not be required for employment, credentialing, licensure, or insurance.[52] As state policies typically suggest that only HCWs who are "at risk" of HIV infection should be tested voluntarily, individual HCWs will continue to determine if, when, and how often they will be tested. Regarding testing, the professional view has prevailed in the states.

Patient Notification State laws are, oddly, virtually silent about patient notification. It is possible to read these laws as implicitly requiring HIV-positive HCWs to notify their patients of this by instructing state health officials to follow CDC guidelines. No state, furthermore, has enacted legislation specifically permitting HIV-positive HCWs to refrain from disclosing this information to their patients.

State public health officials have taken a different approach. In the extreme, New York officials have explicitly adopted a policy allowing HCWs not to reveal their HIV status to

---

[50]Delaware, Maryland, New Hampshire, South Carolina, and Texas.

[51]State laws do not indicate that HCWs who perform exposure-prone procedures should determine their HIV status twice a year, for example. Virginia law does specify that if a patient is directly exposed to HCW's bodily fluids (as defined by CDC), the worker will be deemed to have consented to HIV testing and the release of the test results to the exposed patient.

[52]For a typical statement, see Michigan Department of Health, "Michigan Recommendations on HBV-Infected and/or HIV-Infected Health Care Workers," September 1992.

patients.[53] Whether New York will be able to maintain this policy in the face of legal challenges or public opposition remains to be seen, however.[54] More commonly, states have adopted policies like Michigan's:

> The public health benefit of notification of patients treated by an infected HCW has not be documented. When an infected HCW's [HIV] status becomes known, any notification of patients should be considered on a case-by-case basis taking into consideration whether exposure has occurred, an assessment of specific risks, confidentiality issues, and available resources.[55]

Other states have simply dropped the patient notification provision from their policies. Almost eighty percent of the states with approved policies (twenty one of twenty seven) do not require HIV-positive HCWs to disclose this to their patients.

---

[53]The New York Department of Health issued guidelines in December 1991 that allowed HIV-positive HCWs to perform invasive procedures without disclosing their HIV-status to their patients, if the HCWs used universal procedures.

[54]The New York State Supreme Court began to address this issue in McBarnette v. Feldman. Dr. Feldman was a New York dentist who died from AIDS, and "at the time of his death it was widely reported in the local press that [he] had a substance abuse problem and that he did not follow universal precautions in treating patients." The State publicly offered to provide Dr. Feldman's patients HIV tests, but only 650 of the approximately 3,000 patients accepted the offer. In order to contact personally the other patients, the Health Department sued to obtain Dr. Feldman's patient records. The State Supreme Court ruled in favor of the Department, but noted with some irony that the Department did not require HCWs to disclose their HIV status before they treated patients although it did attempt to inform the patients after they received treatment. The Court spoke strongly in favor of patients' rights to know the HIV status of their HCWs, while noting that if public health authorities chose to limit this right they should at least identify HIV-positive HCWs so that these HCWs could be carefully monitored to ensure that they did not pose risks to patient health. Legislation has since been introduced in New York to require patient notification. AIDS Policy Project, Intergovernmental AIDS Review, February 1992, 11.

[55]Michigan Department of Public Health, "Michigan Recommendations on HBV-Infected and/or HIV-Infected Health Care Workers," September 1992, p. 8.

The willingness of state officials to make patient notification voluntary is inversely related to the political salience of HCW and HIV issues. Public health officials in states that enacted laws were more likely to have retained mandatory patient notification than officials in those states lacking legislation (ϕ=.51, χ^2=7.1, p<.01). Indeed, in only one state without such laws did public health officials preserve mandatory patient notification provisions in their policies.[56]

State Policy Response: A Summary

This analysis suggests that states in which HCW and HIV issues were highly salient also usually experienced operating room politics. Where these issues were not so prominent states were more likely to see board room politics prevail.

State legislatures were more likely to enact legislation where the political salience of HCW and HIV issues was higher. The legislation enacted in these high-salience states tended to be largely procedural. These laws seemed to prod the administrators into action. In states where HCW and HIV issues were not politically salient, legislatures were less inclined to have acted and public health officials were less likely to have issued approved policies.

Although state laws were largely procedural, as expected in operating room politics, states did adopt a variety of substantive policies. The substance of the legislation did not necessarily favor the public view, but attempted to balance public and professional concerns. State laws do not authorize mandatory testing or always require patient notification, for example, but they sometimes mandate universal precautions.

State administrative choices also were affected by political salience. Public health

[56]Kansas was the one state that adopted the CDC guidelines in their entirety without legislation.

officials often acted as if they were being scrutinized by elected officials in states where laws were enacted. In particular, public health officials rarely required patient notification in states where political salience was low; they demanded patient notification more often in states where salience was high. Administrative policies did at times mandate that HCWs follow universal precautions, however, even though there was less political demand for such measures.

State public health officials nevertheless almost uniformly rejected policies that would have placed restrictions on HIV-positive HCWs or required HCWs to submit to HIV testing. Officials rejected these politically popular remedies even in high salience states. Even though bureaucrats may be attentive to politicians' preferences, they apparently do not feel obliged to adopt them. Public health officials no doubt make their own judgments about the political acceptability of various policy options.

How would states respond to the federal mandate that they adopt policies to reduce the risk that HCWs would transmit HIV to their patients? In general, they responded as the "regulatory issue networks" model predicts. Political salience and technical complexity appear to be the dominant factors affecting state policy choices on this issue.

HELMUT KOHL AS POLITICAL LEADER--SKETCHING MAJOR THEMES

George K.Romoser
University of New Hampshire/
Freiburg University

"...es muss zwischen Zustimmung über Parteigrenzen hinweg und Führungsstärke einen Zusammenhang geben, der die persönlichen Popularitätswerte des früheren Bundeskanzlers Schmidt ebenso wie das Scheitern seiner Regierung erklärt und der zugleich auch einen Zugang zu der Frage bietet, warum die Regierung Kohl bei so vielen Erfolgen zugleich so viel Kritik erfährt."

--Wolfgang Schäuble, early 1989 [1]

My subject has to do in a central sense with that nebulous topic called "leadership." Here I shall break a lance for the notion that Chancellor Helmut Kohl, in that leading office in Germany since October 1,1982, represents successful leadership, especially when viewed within the given conditions of West German/ German politics and society since then. Before jaws drop in disbelief, I add that this is, at least, one way to characterize the overview I offer in this brief presentation. Obviously, there can be other conclusions from the evidence, and to apply a recent comment by the Chancellor ("Ich freue mich über die Probleme, die wir in Deutschland haben"[2]) to a different topic, I would be happy for a solid discussion in this panel on conceptual and substantive problems of discussing"leadership."

---

[1] "Erfolgreich Regieren:Politikvermittlung und politische Führung," DIE POLITISCHE MEINUNG,v.34,No.242(Jan/Feb 1989),11

[2] Speech to the Economic Council of the CDU, Bonn, June 15,1993,in BULLETIN(of the Presse-und Informationsamt der Bundesregierung (henceforth:BPA), July 9,1993, 1.

I can affirm that much of the leadership literature I have reviewed in an--admittedly,rushed--period, leaves me rather unenlightened. It tends to the abstruse or self-evident, or both. There are questions whether discussions of leadership can make much sense divorced from analysis of the particular setting in which leaders function.After all, even some of the most cogent and powerful statements on political leadership--those of Max Weber in Politics as a Vocation--were connected with Weber's articulation of the "darkness" afflicting Germany in particular and the West in general.

When discussing Helmut Kohl, we are confronted first of all with a rather long series of jokes and sardonic characterizations--and not only in the popular press. Moreover, his fall from power has been regularly forseen or even predicted--probably at least four times since 1982. While effective leadership and maintenance of the leader's position of power,influence, and title are not necessrily identical, it is usually assumed,obviously, that they go together. In this sense, titles and topics such as "Wut auf den Wurstler, " "Führungslosigkeit in der Politik," dismal approval ratings," and "Kohl's Unfulfilled Promise"--to take just a few, internationally selected[3]--are thoroughly characteristic of press treatment over the years. Exceptions to this chatacterization would be the unification year of 1990 and the electoral success of December and, perhaps for the more sophisticated, Kohl's routing of the Heiner

Geissler-Lothar Späth-Rita Süssmuth upstart troika at the CDU congress in Bremen in September 1989.[4]

In some of the press reporting, and in the scholarly writing on Kohl's Chancellorship, of course, heavy emphasis has been placed upon his thoroughgoing roots in the Christian Democratic Party and his knowledge--from long experience, from having emerged "out of the ranks," and from his telephone habits and personal contacts--of the "grass roots." This has been viewed as the major reason for his durability as Chancellor. But there are not only frequent invidious contrasts between Kohl's capabilities as a party operative and the demands of true national leadership, but most recently, it seems, "die Lage /for Kohl/ war noch nie so ernst." With a veritable barrage of local, Land and national or European elections in 1994, and with the threats of "Parteiverdrossenheit" and the drainage of votes to the Republikaner, Kohl appears to many as a best a survivor in the absence of any viable alternatives,and as dispensable should unrest in his party increase or a form of "Grand Coalition" be necessary in the event of failure of his coalition to gain a working Bundestag majority in the fall 1994 federal election.[5]

To more adequately focus on the work of Helmut Kohl as Chancellor--the theory and pattern of his leadership in a generalized interpretation--the setting of his time in office must be considered. The political, social, and cultural "surroundings" pose specific

---

[4] See,for example, "No Contest," THE ECONOMIST, Sept.16,1989,52-53: "As Chancellor of West Germany, Mr.Helmut Kohl may look a bit of a bumbler;as a fixer of party rivals he moves with awesome dexterity."

[5] Consult also: Gordon Smith, "The Resources of a German Chancellor." WEST EUROPEAN POLITICS, v.14,No.2 (April1991),48-61.

parameters for leadership accomplishment. Using (though not solely) certain interpretations of leadership problems in today's Germany, and, more generally, in Western industrialized societies as a whole, Kohl's situation and behavior in office may be described briefly, and from this basis, several attitudes towards the meaning of "leadership" may be explored.

The initial interpretations stem from two of the Chancellor's closest advisers: Wolfgang Bergsdorf, Head of the "Inland" section of the Bundespresseamt, and a political scientist with degrees from Bonn University, and Wolfgang Schäuble, now a much better known man than Bergsdorf, former Minister of the Interior, and now leader of the CDU/CSU forces in the Bundestag. Indeed, now seemingly largely recovered from a serious assasination attempt a few years ago, except for the resulting paralysis which confines him to a wheelchair, Schäuble is frequently in the German news as a "power behind the scenes" and possible successor to Kohl. Were one to believe Der Spiegel, indeed (which one is free to do at a certain peril),the talented Swabian,essentially Kohl's protege, is not far off in the wings. In any case, his views on leadership may partly reflect and partly shape Kohl's own actions and perspectives.

It is the academician Bergsdorf, a member of Kohl's inner circle, who has more fully developed over the last several years certain themes pertaining to leadership in today's Germany. These are quite consistent with Schäuble's approach, but I cannot say, at least not yet, what the personal or intellectual connections between the two "theorists"(or "partial theorists")are. In any case, Bergsdorf in his writings has pointed both to necessities for effective leadership in today's world, and the grave limitations on the possibilities

for effective leadership.

One of Bergsdorf's central concerns appears to be the "linguistic presentation of politics," and it is an emphasis which deserves attention.[6] It is clearly connected with the citation from one of Schäuble's essays cited at the head of this paper. It is a specific example--perhaps the most important example--of what Bergsdorf(and,probably, Schäuble)see as the"surroundings"of contemporary politics. The role of the media is the most obvious reference point, but not the only one. It would be too simple to dispose of the point by characterizing the argument as a hackneyed complaint about the role of journalists--a complaint voiced by those close to political power. In any case, in the view of our authors, politics today may be seen as something of a contest in "political communication" between the leaders and the media.[7] Effective leaders have to "exercise communicative discipline in the interest of general policy objectives," but this need conflicts with the "insatiable" desire of journalists,and the public influenced by journalists, for "news,""i.e. a rapid turnover of topics and personalities."[8] Alluding to Max Weber's ideas about "enthusiasm, a sense of responsibility, and a sense for proportion" as personality traits needed by holders of political office, Bergsdorf finds the result of the war between communicative discipline and the voracious consumption of

[6] Wolfgang Bergsdorf, "Germany Under Stress," GERMAN COMMENTS, No. 30 (april 1993), 45.

[7] Bergsdorf, "Political Leadership as a Challenge of Communication," GERMAN COMMENTS, No.18 (April 1990),78-84.

[8] Ibid.,79,83.

news to be "an extreme challenge /which/ modern democracy poses for political leaders."[9] More precisely, it means that there is a on the one hand a need for, in Weber's sense, maintaining "proper portion" or "reflective distance between oneself and political reality", but in fact "political leadership in a pluralistic democract is not possible without damage to personal prestige." Even political victories "have a Pyrrhic nature." The public, so to speak, is not only on a different wavelength, but in a different world of images and expectations entirely.[10] What the leader can do, then, is follow a "Verfahren von 'trial and error'... und innerhalb der Frist einer Legislaturperiode bis an die Grenze der Belastbarkeit der eigenen Mehrheitsfähigkeit durchsetzen."[11]

Apologia for the style of Kohl's leadership? "Theoretical" justification with the tools of the study of political psychology, now themselves almost common currency? Such thoughts lie near, but even if such imputations seem plausible, they do not necessarily disprove the points our authors and political advisers make.For the views should cause us to reflect on expectations from "leadership" and on frequent use of that term as a code word for accomplishment, progress, or reform--investing it with an almost magical quality especially cherished in a liberal tradition. "Führungslosigkeit" goes along with "Ratlosigkeit" and "Orientierungslosigkeit" in many such scenarios.[12] We know of Helmut Kohl's reputation for slowness in making decisions, for reliance on party loyalty rather than public

[11] Schäuble,in POLIT.MEINUNG(No.242),11.

articulation and, at least among some, for a sort of pandering to potential right-wing defectors from the CDU. The most fundamental criticism seems to center on alleged failure to face up to "real issues," with Kohl's self-admitted "mistakes" in judging the rapidity of improved conditions in the former "East Germany" currently occupying the center of attention.

Our theorists of political leadership pursue their critique beyond discussion of the role of media and of "images" said to invent a new "reality" to run alongside the facts. Again, however, their views are not necessarily unique when they refer to the fragmentation and individualization of cultural, social, and political positions in contemporary Germany: "Der politische Streit um ein Regierungsvorhaben vollzieht sich nicht nur zwischen Mehrheit und Minderheit im Parlament, sondern zugleich in einem Feld prinzipiell unendlich vieler pluralistischer Interessen..." And yet the view of "ungovernability is rejected (Unregierbarkeit)[13]; or at least is has been thus far. This is partly because they see mainly the Social Democrats as a party incapable of governing--as the very prototype of the incoherence of interest clashes with no leadership, or with inadequate coordination--as shoen by the last federal SPD-led govenment, that of a Chancellor, Helmut Schmidt, more or less buried by his own party. Of course, this view of the SPD is not unique, and it seems even more plausible today than a decade ago.[14]

---

[12] Cf., for example, Robert Leicht, "Das Bündnis der Ratlosigkeit," DIE ZEIT, August 27, 1993, 1; the comments by Heinrich Weiss, former head of the Bundesverband der Deutschen Industrie (BDI) and of the Economic Council of the CDU: "In der Politik fehlen die Führungspersönlichkeiten," (Interview), SÜDDEUTSCHE ZEITUNG, May 28, 1993, 9. Weiss left the BDI Chairmanship in 1992, and in January 1993 quit the CDU.

[13] Schäuble, in POLITISCHE MEINUNG (No. 242), 10.

The authors see contemporary German society as one of increasing "individualization" of views--postmaterial conditions, in the words of other authors. This makes consensus and effective action difficult.[15] To return to Max Weber, we might summarize that the Kohlians are arguing a Weberian point in order to examine the possibilities for effective leadership today: we should not be at the mercy of chance or fortune, undisciplined instincts, sympathies and antipathies in following politics as a vocation[16]--but we live in an age which writes such attitudes large.

The most recent, and probably most serious of the threats to Kohl's survival as a political leader are depicted in a related way. Kohl is being victimized in public opinion by a Zeitgeist that is itself a product of years of affluence, and resentment at having this condition threatened. The more or less concealed criticism of Christian Democratic encouragement of the values of affluence (a problem summarized by Daniel Bell some years ago under the title "The Cultural Contradictions of Capitalism")may,indeed,be expressed more openly by conservatives less linked to the Kohl regime and, of course, in a paradoxical and muddled way by some "left" critics of"the consumption society." For the Kohlians, the Chancellor's hesitations and reversals about asking sacrifices in

---

[14] As just one example, see Gunter Hofmann, "Die Enkel sind alt geworden, "DIE ZEIT, April 30,1993, 3.

[15] Cf. Hans-Georg Betz, POST-MATERIAL POLITICS IN GERMANY(New York: St.Martin's Press,1991); Bergsdorf, "Vom Guten des Schlechten:Herausforderungen für die Union," DIE POLITISCHE MEINUNG, v.34,No.243(March/April 1989),29-36.

[16] Cited from the discussion by Robert Eden in POLITICAL LEADERSHIP AND NIHILISM: A STUDY OF WEBER AND NIETZSCHE (Tampa: University Presses of Florida, 1983),p.15.

connection with unification and economic improvement in the area of the former GDR are not primarily because of a defect in political leadership,but arise from the very conditions of the time and society: according to views at least attributed to Wolfgang Schäuble, the "Zeitenbruch" of the late sixties created, or helped create, the decline of the transmission of values in the home, the school, and even the churches, and the domestic political problems of our day are connected with this failure.[17] A sense of solidarity is one of the values which has been gravely endangered,and the results are apparent today,in the Kohlian view, in connection with the problems confronting a true unification of the "two Germanies."

But with such themes, we may turn to statements by the leader himself, Helmut Kohl. At least partly, it appears, because of the new round of criticism in the last two years, and the approach of the many elections of 1994, the analyses thus far sketched are being ventilated and expanded by the Chancellor in public declarations. To be sure, such speeches do not halt the criticisms; in conformity with the dilemmas noted, the increasing difficulty of reaching policy agreements on complicated issues arising from the merging of the two Germanies hampers the incremental style of decision-making which has been Kohl's trademark. Every accomplishment (or "half accomplishment")is purchased at a higher price, or seems to contain inadequate measures--at least this is a working hypothesis. So it seems to have been recently with the "Solidarity Pact" supposed to promote a division of fiscal burdens for the sake of improvements in the East.[18] Thus Kohl's speechmaking on problems and goals in

---

[17] Cited and partly quoted in DER SPIEGEL, v.47,No.8 (2/22/93),25. I am aware of the limitations of the magazine as a reliable source.

[18] For the "pact," see BULLETIN der BPA,Nos. 22,25,26 (March 16,25, 26,1993)

German politics and society may be an indication of a weakening of ability to engineer the "coordination" for which he has been noted.

According to the Kohlians cited earlier, "combativeness" and "compromise" are two sides of effective political leadership, and "in emotional terms...are a unit." "What is needed is to create unity in one's own political formation and to strengthen this unity so as to have a chance of success in competition with other political groups.[19] The heretofore-mentioned notion of communicative discipline complements these postures. But we have noted earlier that the discipline in communication, according to this theory, contains a strong element of reticence,and in fact this has seemed to be part of Kohl's overall approach. He has been accustomed to rely on a process of "ripening" decisions within his party and--very important--within the coalition of CDU, CSU and FDP. Now it appears necessary to move further into the realm of public rhetoric, perhaps "weil die Anfälligkeit nicht nur in Deutschland, sondern in praktisch allen Ländern der westlichen Welt gegenüber populistischen Strömungen in letzter Zeit zugenommen hat."Against this trend one must emphasize the importance of ties to institutions.[20]

---

[19] Bergsdorf, in GERMAN COMMENTS(No.18), 82-83.

[20] Helmut Kohl, "Die Rolle der Meinungsforschung in der freiheitlichen Demokratie," BULLETIN DER BPA, May 12,1993 (Address in Bonn at presentation of the 1984-1992 Yearbook on Public Opinion of the Institut f.Demoskopie,Allensbach--April 27,1993. Henceforth identified as SPEECH B).
Other speeches from the first half of 1993 examined, or cited below: "Standortbestimmung Deutschlands für die Herausforderungen der 90er Jahre,"BULLETIN, Jan.27,1993, Speech of Jan.18 to the Industrie und Handelskammer Münster(SPEECH A);
"Neue Prioritäten für die Zukunftsgestaltung Deutschlands," BULLETIN, May 12,1993, Speech of April 30 to the Industrie-und Handelskammer f.München und Oberbayern, in Munich(SPEECH C);

Perhaps not surprisingly then, Kohl appears in 1993 to have launched a series of themes with strong elements of social and cultural criticism. They emphasize unity or solidarity, and have culminated thus far in the May 6 declaration: "Wir alle wissen, daß sich die Zukunft der Industrienation Deutschland nicht als kollektiver Freizeitpark organisieren läßt....Wir brauchen einen neuen Bürgersinn, wir brauchen...gelebten Patriotismus, bei dem wir uns auf Tugenden besinnen wie Mut und Verläßlichkeit,Fleiß und Eigenverantwortung, Mitmenschlichkeit und Hilfsbereitschaft."(Speech F-343). His emphasis on the "hysteria" which he claims reflects the "deutsche Manie des Nörgelns und Jammerns" replicates the notion of the over fragmentation of German viewpoints and interests,for it is called forth, he claims,by the slightest changes or signs of uncertainty. An "Egoistenkult der Selbstverwirklichung" is at least partly to blame.(Speech D-338). The Germans became too "comfortable" and now a "geistig-immateriellen" renewal is needed(Speech E-342-3).

While a central theme of Kohl and his followers is the need for unifying approaches, it is obvious (also to them,I think)that it is more and more difficult to find, articulate and build upon such concepts or approaches, given the heightened expectations of many about what could or should be done by leaders and,at the same time

"Kulturnation Deutschland--Herausforderung und Perspektiven," BULLETIN, May 17,1993. Speech of May 11 to the Jahresversammlung des Börsenvereins des Deutschen Buchhandels,in Bonn (SPEECH E);& "Die einigende Kraft des kulturellen Erbes im zusammenwachsenden Europa," Speech of May 6,1993 to the Bastei-Lübbe Verlag in Cologne (SPEECH D); "Die Soziale Marktwirtschaft als Ordnung der verantworteten Freiheit," see above,footnote 2,June 15,1993,Bonn, (SPEECH F); "Neue Weichenstellung zur Gestaltung der Zukunft," BULLETIN, July 12,1993. Speech of June 29 to Bundesarbeitsgemeinschaft der Mittel-und Grossbetriebe des Einzelhandels,in Cologne (SPEECH G)

the vast array of changes in the world(the movement of populations and the tensions resulting,to name just one area). Such multiplication of perspectives and interests,heightened,as has been indicated above, by new methods of "communication," go far beyond even the fact that with the integration of "East" Germany, there are more actors in negotiating situations within parties and outside the parties--the task of "coordination," which some have seen as central to the way German govenment functions[21], becomes more complicated. Andy Warhol is proving prophetic, perhaps: if not everyone is famous for fifteen minutes, at least layer on layer of events, images, pseudo-events, claims and complaints dominate our world--at least what most hear and see of the world.

Obviously, for one whose method of leadership is said to embrace(and there is plenty of evidence for this) "distance" between the leader and the hurly burly of events--as noted above about Kohl the balancing act becomes ever more formidable. A recurrent theme in Kohl's career from the start, now being re-emphasized in his recent utterances, is that the concept and developing "fact" of Europe will somehow provide a unifying guideline(Speech D-338, for example).An immediate response--or theme--is,of course, that the idea and reality of Europe is itself under weighty stress.[22]

---

[21] See Gordon Smith,"Resources..." in WEST EUROPEAN POLITICS (April 1991)on the first point, and the writings of Wolfgang Jäger on the second, "coordination democracy"as an apt description of policy-making in the Federal Republic.

[22] See, for example, Günther Nonnemacher, "Die Krise im Westen," FRANKFURTER ALLGEMEINE, June 4,1993, 1.

Obviously, little if anything that has been said here tells us much about concrete relationships inside the Kohl government or--particularly--inside the the coalition of partties thus far sustaining it. That study is a different task.The purpose here,rather, has been to focus on, if you will, the "direction" or "nature" of Kohl's leadership as seen by those close to him and, perhaps even more, to encourage reflection on types of leadership, the limits of choice for leaders, and alternative assumptions about the functions of leaders. Helmut Kohl has "survived" as Chancellor eleven years--"inexorable", as some have termed him. He has both benefited from and contributed to the fact that the German political system has tendcd to be more "stable" than "innovative." [23] It is appropriate in conclusion to raise the question of alternative ways of leadership--with the emphasis,again, not on concrete details, but on concepts and approaches.

To do this properly would require much more systematic study than has been possible at the present time. But also, it would require more articulation by Kohl's critics of leadership alternatives--meaning not just personalities. Beyond that, the questions about varying leadership conceptions and methods is obviously not limited to the German situation.

Earlier references to Max Weber remind us how lacking we are in this time of thinkers and analysts of Weber's capacity. More immediately, Weber's work helps us today to broaden and deepen our understanding of the kaleidoscope of political events and structures.

[23] Renate Mayntz," Executive Leadership in Germany:Dispersion of Power or 'Kanzlerdemokratie"?, in Richard Rose and Ezra N. Suleiman,eds., PRESIDENTS AND PRIME MINISTERS (Washington: American Enterprise Institute,1980),139-170.

In a recent study, Robert Eden, developing a contrast between "Wilsonian" ideas of leadership and Weberian ideas, has written of "plebiscitary leader democracy" as tied in with "reformist" notions articulated by Woodrow Wilson, and positing enthusiastic action by bold new leaders.[24] Wilson,child of the Progressive era, complained of "leaderless liberalism"as early as 1897; he wanted to combine liberalism and leadership. Of course, he was not alone in this view in that era, but his approach was certainly more "democratic" and more "populist" for example, than that of Theodore Roosevelt and some of his followers or associates such as Herbert Croly. Eden points to the difference between Wilson's approach and that of Weber; in our context, it is a difference which turns on the issue of "distance" between leader and public events. For the Wilsonian tradition, the new kind of leader is subsumed in and becomes part of the "public," because he or she is doing great deeds for humanity.

Eden's discussion richly deserves examination in the context of studying Kohl's leadership and critiques of that leadership. Has, indeed, the Wilsonian vision of leadership brought unmitigated good to America, where it established deep roots and has now transcended earlier party differences in many ways (one need only mention Ronald Reagan as a "populist" President)? As for Germany, does not something like the Wilsonian perspective Eden sketches underlie many of the expectations from a new "true" leadership? And what would be the

---

contours, methods and concrete results of a more "engaged" leadership? What, above all, would it mean in Germany? Most immediately (because, certainly, one realizes that extreme contrasts in leadership conceptions do not necessarily prevail in practical politics), are there any signs of alternative leaders in Germany at present who would combine more innovation and engagement with stability?

MILITARY ESTABLISHMENTS IN THE AFTERMATH OF THE COLD WAR: A THEORETICAL AND COMPARATIVE ANALYSIS[1]

James N. Rosenau
The George Washington University

and

Paul R. Viotti
University of Denver

I took my oath to the Soviet Union. In principle the oath is invalid. There is no Union. My country is not here.

Anatoly Azovkin, 20-year old tank division driver from the Russian Far East[2]

The army is *my* army. For me, it's the measuring stick of my life. It's my pride, my soul's pain, my labor and sweat. It's my entire life. It's my father, who defended Leningrad, and my brothers, officers of the armed forces. What is happening to all of it?

Lt. Col. Melis Bekbasynov, member of the Russian officer corps[3]

Our points of view were very different; now they have converged around peace. No one here is interested in war anymore.

Padrino Pilartes, guerrilla colonel in Angola[4]

A curse on you all. Where are you taking the world?

Azerbaijani grandmother shouting at a helicopter loaded with military supplies[5]

These diverse observations, offered from various perspectives on and within armed forces, highlight the enormous stresses and strains that are rocking military establishments in the aftermath of the Cold War: In a turbulent world of fragmenting polities, faltering economies, restless publics, refocused enmities, and vast international transformations, where do soldiers and military organizations fit? Can they adjust to an ever greater global complexity that is rendering the threat and use of coercive force increasingly questionable as an instrument of effective control? What roles and options are available to them as the pace of change accelerates in every country and on every continent? Must their historic mission as conservators and stabilizers of their societies give way in the face of shifting values and priorities? Can the unique hierarchical structures and loyalties of their organizations withstand the powerful and contradictory globalizing and decentralizing tendencies presently eroding long-standing institutions and practices in developed and underdeveloped societies alike?

---

[1]Sections of the paper are drawn from James N. Rosenau, "Armed Force and Armed Forces in a Turbulent World," in James Burk (ed), *The Military in New Times: Adapting Armed Forces to a Turbulent World* (Boulder: Westview Press, forthcoming), pp. 25-60.

[4]*New York Times*, December 16, 1991, p. A9.

[5]*Los Angeles Times*, January 12, 1992, p. A8

Such are the questions to which the ensuing analysis is addressed. It rests on the underlying premise that no domain of human affairs has remained immune to the vast transformations of our time, that it is thus unimaginable that the huge changes at work on a global scale have not had enormous consequences for *military* institutions and personnel everywhere---that as new constraints alter the viability of armed force as an instrument of public policy, so will changes occur in the role, morale, coherence, and effectiveness of armed forces. No less important, it is also presumed that the consequences of turbulence experienced by militaries have, in turn, interactively fed back into the cascading processes that sustain the vast global transformations.

Put in the rhetoric of scientific inquiry, armed forces around the world need to be treated, not as constants in a changing world, but as both independent and dependent variables which are central to the course of events as the millennium draws to a close. More precisely, at any moment in time their conduct can be analyzed as both sources and consequences of global turbulence, but across time these dynamics need to be seen as so interactive as to undermine any effort to differentiate among causes and effects. Accordingly, here the analysis proceeds from an assessment of armed forces as dependent variables to an estimate of their operation as independent variables to a conclusion that probes the interactive consequences of how their responses to change may be shaping their emergent roles in an emergent global order.

THE TURBULENCE MODEL

To facilitate these tasks a broad theoretical context is needed. Although a number of events in recent years appear illustrative of the emergent dilemmas, opportunities, and likelihoods with which armed forces must contend in all parts of the world, the question of whether they form coherent patterns that allow for generalization on a global scale is far from self-evident. Conceivably each event is a response to unique circumstances. It is not enough, therefore, simply to call attention to the end of the Cold War, the collapse of the Soviet Union, the 32-nation coalition that ousted Iraq from Kuwait, or any of the many other startling developments that have rocked world politics since 1988. Episodes such as these are surely relevant to the broad changes that have ensued and that have contributed to the welter of adaptive challenges confronting armed forces. Important as they are, however, these major developments are nonetheless empirically founded and thus cannot in themselves be mined for insights as to whether and how various armed forces will cope with the adaptive challenges. The Cold-War-has-ended explanation can only take us so far. It describes what no longer prevails, but it does not subsume the bases for anticipating what lies ahead.

Accordingly, insofar as the future is concerned, the end of the Cold War, the collapse of the Soviet Union, the Persian Gulf war, and other such developments must be viewed as outcomes and not as underpinnings of change. They are, in effect, the surfacing of complex dynamics that reach deep into societies and their relationships to each other. Put in still another way, outcomes are empirical and observable, whereas underpinnings are not readily discernible and can only be identified through a theoretical perspective that guides inquiry beneath the immediately visible manifestations of change. Viewed in this way, the order on which the Cold War rested did not collapse suddenly in 1989. Rather, it began its long downhill slide well before the Berlin Wall came down and the people of Eastern Europe threw off the yoke of their communist regimes. These latter developments were only the last stage in a complex process whereby the foundations of the post-World War II order underwent transformation. To be sure, pundits, politicians, academics, and people everywhere were taken by surprise when the governments in Prague, Budapest, Sofia, and other East European capitals were, suddenly, replaced. But the pervasiveness of the surprise is not so much a measure of the rapidity with which history changed course as

it was a measure of how fully people tend to focus on outcomes rather than underpinnings when they respond to the course of events. Had they been sensitive to underpinnings, to the deeper sources of the events that caught their eyes, they would have appreciated well before 1989 that a new global order was in the process of evolving.

So we return to the need for a broad theoretical context that allows us to sift through the diverse empirical indicators of change and interpret them, not as responses to unique circumstances, but as products of complex dynamics that are global in scope and can thus facilitate clarity on the emergent problems with which military institutions and personnel everywhere must cope. Is it possible, in short, to frame a theory that treats armed forces as dependent variables which, through their variation, reflect the underlying transformations that continue to rock the course of events?

Our positive response to this question derives from a recently formulated bifurcation, or turbulence, theory of world politics.[6] Whatever its limitations, this model has the twin virtues of being global in scope and of focusing centrally on transformative dynamics while not ignoring those that are resistant to change and promote continuity. What underpinnings have undergone fundamental transformation, the theory enables us to ask in the present context, such that armed forces around the world have experienced new challenges and evidenced new forms of behavior?

The theory's answer involves the basic parameters of world politics. If the parameters of any system are conceived as the boundaries beyond which lie the environment of the system---those recurrent patterns that may impact upon but are not a part of the system's functioning---and within which the variables of the system undergo their unceasing processes of variation, then it follows that the parameters are normally fixed features of the system. They provide its continuities in the sense that they remain constant even as fluctuations occur in its variables. They are, in effect, the foundations of global order---those values, premises, resources, and enduring institutions that underlie and limit the nature of the international pecking order, that accord legitimacy to issues on the global agenda, that underpin orientations toward armed force and armed forces, that justify concern for human rights, that shape predispositions toward authority and authorities, and so on through all the sources out of which variation occurs within the system.

If the parameters of world politics form the bases of the prevailing global order, then a new global order is bound to emerge if and when its parameters undergo profound transformation. And that is exactly what has happened in recent decades. For the first time since the period that culminated in the Treaty of Westphalia in 1648, the basic parameters of world politics have undergone extensive and rapid alteration, with the result that the underpinnings of a new world order have been laid.[7] Put differently, global turbulence is defined in terms of simultaneous parametric transformation,[8] a formulation that leads to the conclusion that the world is presently experiencing its first bout of turbulence in more than three hundred years.

---

[6]*James N. Rosenau, Turbulence in World Politics: A Theory of Change and Continuity* (Princeton: Princeton University Press, 1990).

[7]The analysis which concludes that the system's parameters are undergoing their first profound transformation since 1648 can be found in Rosenau, *Turbulence in World Politics*, Chap. 5.

[8]For the derivation of this definition of political turbulence, see Rosenau, *Turbulence in World Politics*, pp. 59-78.

The theory identifies three parameters that are central to any prevailing global order: the overall structure of global politics (a macro parameter), the authority structures that link macro collectivities to citizens (a macro-micro parameter), and the skills of citizens (a micro parameter).[9] Each of these parameters is judged to have undergone transformation in the current era, and the relative simultaneity of the transformations is considered a major reason why signs of an emergent global order---of deep underpinnings fostering unexpected outcomes---took politicians, journalists, academics, and others so utterly by surprise when the collapse of communism rendered them unmistakably manifest late in 1989.

Table 1: TRANSFORMATION OF THREE GLOBAL PARAMETERS

	from	to
micro parameter	individuals less analytically skillful and cathectically competent	individuals more analytically skillful and cathectically competent
macro-micro parameter	authority structures in place as people rely on traditional and/or constitutional sources of legitimacy to comply with directives emanating from appropriate macro institutions	authority structures in crisis as people evolve performance criteria for legitimacy and compliance with the directives issued by macro officials
macro parameter	anarchic system of nation-states	bifurcation of anarchic system into state- and multi-centric subsystems

Table 1 summarizes the changes in the three parameters, but the order of their listing should not be interpreted as implying causal sequences in which the actions of individuals are conceived to precede the behavior of collectivities. On the contrary, incisive insights into global turbulence are crucially dependent on an appreciation of the profoundly interactive nature of the three parameters---on recognizing that even as individuals shape the actions and orientations of the collectivities to which they belong, so do the goals, policies, and laws of the latter shape the actions and orientations of individuals. Out of such interaction a network of causation is fashioned that is so thoroughgoingly intermeshed as to render impossible the separation of causes from effects. Indeed, much of the rapidity of the transformations at work in world politics can be traced

[9]Rosenau, *Turbulence in World Politics*, pp. 10-11. For a formulation that identifies six parameters, see Mark W. Zacher, "The Decaying Pillars of the Westphalian Temple: Implications for International Order and Governance," in James N. Rosenau and Ernst-Otto Czempiel (eds.), *Governance Without Government: Order and Change in World Politics* (Cambridge: Cambridge University Press, 1992), Chap. 3.

to the ways in which the changes in each parameter stimulate and reinforce changes in the other two.

THE MICRO PARAMETER: A SKILL REVOLUTION

The transformation of the micro parameter is to be found in the shifting capabilities of citizens everywhere. Individuals have undergone what can properly be termed a skill revolution. For a variety of reasons ranging from the advance of communications technology to the greater intricacies of life in an ever more interdependent world, people have become increasingly more competent in assessing where they fit in international affairs and how their behavior can be aggregated into significant collective outcomes. Included among these newly refined skills, moreover, is an expanded capacity to focus emotion as well as to analyze the causal sequences that sustain the course of events. As will be seen, the skill revolution is also judged to have encompassed soldiers and their officers.

Put differently, it is a grievous error to assume that people are a constant in politics, that the world has rapidly changed and complexity greatly increased without consequences for the individuals who comprise the collectivities that interact on the global stage. As long as people were uninvolved in and apathetic about world affairs, it made sense to treat them as a constant parameter and to look to variabilities at the macro level for explanations of what happens in world politics. Today, however, the skill revolution has expanded the learning capacity of individuals, enriched their cognitive maps, and elaborated the scenarios with which they anticipate the future. It is no accident that the squares of the world's cities have lately been filled with large crowds demanding change.

It is tempting to affirm the impact of the skill revolution by pointing to the many restless publics that have protested authoritarian rule and clamored for more democratic forms of governance. While the worldwide thrust toward an expansion of political liberties and a diminution in the central control of economies is certainly linked to citizens and publics having greater appreciation of their circumstances and rights, there is nothing inherent in the skill revolution that leads people in more democratic directions. The change in the micro parameter is not so much one of new orientations as it is an evolution of new capacities for cogent analysis. The world's peoples are not so much converging around the same values as they are sharing a greater ability to recognize and articulate their values. Thus this parametric change is global in scope because it has enabled Islamic fundamentalists, Asian peasants, and Western sophisticates alike to serve better their respective orientations. And thus, too, the commotion in public squares has not been confined to cities in any particular region of the world. From Seoul to Prague, from Soweto to Beijing, from Paris to the West Bank, from Belgrade to Rangoon---to mention only a few of the places where collective demands have recently been voiced---the transformation of the micro parameter has been unmistakably evident.[10]

This is not say that people everywhere are now equal in the skills they bring to bear upon world politics. Obviously, the analytically rich continue to be more skillful than the analytically poor. But while the gap between the two ends of the skill continuum may not have narrowed, the advance in the competencies of those at every point on the continuum is sufficient to contribute to a major transformation in the conduct of world affairs. More

---

[10]For lengthy inquiries into both the indicators and sources of the skill revolution, see Rosenau, *Turbulence in World Politics*, Chap. 13, and James N. Rosenau, "The Relocation of Authority in a Shrinking World: From Tiananmen Square in Beijing to the Soccer Stadium in Soweto via Parliament Square in Budapest and Wencelas Square in Prague," *Comparative Politics*, Vol. 24 (April 1992), pp. 253-72.

important for present purposes, the emergent global order rests on increasingly relevant micro foundations---on individuals who cannot be easily deceived and who can be readily mobilized on behalf of goals they comprehend and means they approve---a shift that tends to undermine the traditional bases of military organization and discipline. The new global order is thus more inclusive than its predecessor. Military elites retain control over resources, communications, and the other instruments through which coercive force is exerted, but increasingly they are constrained by publics and subordinates who follow their activities and are ever ready to demand appropriate performances in exchange for support.

THE MACRO-MICRO PARAMETER: A RELOCATION OF AUTHORITY

This parameter consists of the recurrent orientations, practices, and patterns through which citizens at the micro level are linked to their collectivities at the macro level. In effect, it encompasses the authority structures whereby large aggregations, be they private organizations, public bureaucracies, or military establishments, achieve and sustain the cooperation and compliance of their memberships. Historically, these authority structures have been founded on traditional criteria of legitimacy derived from constitutional and legal sources. Under these circumstances individuals were habituated to compliance with the directives issued by higher authorities. They did what they were told to do because, well, because that is what one did. As a consequence, authority structures remained in place for decades, even centuries, as people unquestioningly yielded to the dictates of governments or the leadership of any other organizations with which they were affiliated. For a variety of reasons, including the expanded analytic skills of citizens noted above, the foundations of this parameter have also undergone erosion. Throughout the world today, in both public and private settings, the sources of authority have shifted from traditional to performance criteria of legitimacy. Where the structures of authority were once in place, in other words, now they are in crisis, with the readiness of individuals to comply with governing directives being very much a function of their assessment of the performances of the authorities. The more the performance record is considered appropriate---in terms of satisfying needs, moving toward goals, and providing stability---the more are they likely to cooperate and comply. The less they approve the performance record, the more are they likely to withhold their compliance or otherwise complicate the efforts of macro authorities.

As a consequence of the pervasive authority crises, states and governments have become less effective in confronting challenges and implementing policies. They can still maintain public order through their police powers, but their ability to address substantive issues and solve substantive problems is declining as people find fault with their performances and thus question their authority, redefine the bases of their legitimacy, redirect their loyalties, and withhold their cooperation. Such a transformation is currently being played out in the countries of the former Soviet empire, where the redirection of loyalties and the application of performance criteria have eroded favorable predispositions toward the military establishment. In the words of one Russian,

> In our parents' day, [the army] could get away with [a compulsary draft]. People believed in suffering and sacrifice then. They believed they could do everything for the glory of the motherland and get no compensation for it. That's not a good argument for our generation.[11]

---

[11]Quoted in Rick Atkinson and Gary Lee, "Soviet Army Coming Apart at the Seams," *Washington Post*, November 18, 1990.

But authority crises in the former Soviet Republics are only the more obvious instances of this newly emergent pattern. It is equally evident elsewhere, albeit the crises take different forms in different countries and different types of private organizations. In Canada the authority crisis is rooted in linguistic, cultural, and constitutional issues as Quebec seeks to secede or otherwise redefine its relationship to the central government. In France the devolution of authority was legally sanctioned through legislation that privatized several governmental activities and relocated authority away from Paris and toward greater jurisdiction for the provinces. In China the provinces enjoy a wider jurisdiction by, in effect, ignoring or defying Beijing. In Yugoslavia the crisis has led to violence and civil war. In the crisis-ridden countries of Latin America the challenge to traditional authority originates with insurgent movements or the drug trade. And in those parts of the world where the shift to performance criteria of legitimacy has not resulted in the relocation of authority---such as the United States, Israel, Argentina, the Philippines, and South Korea---uneasy stalemates prevail in the policy-making process as governments have proven incapable of bridging societal divisions sufficiently to undertake the decisive actions necessary to address and resolve intractable problems.

Nor is the global authority crisis confined to states and governments. They are also manifest in subnational jurisdictions, international organizations, and nongovernmental transnational entities. Indeed, in some cases the crises unfold simultaneously at different levels: just as the issue of Quebec's place in Canada became paramount, for example, so did the Mohawks in Quebec press for their own autonomy. Similarly, just as Moldavia rejected Moscow's authority, so did several ethnic groups within Moldavia seek to establish their own autonomy by rejecting Moldavia's authority. Similarly, to cite but a few conspicuous examples of crises in international and transnational organizations, UNESCO, the PLO, the Catholic Church, and the Mafia have all experienced decentralizing dynamics that are at least partly rooted in the replacement of traditional with performance criteria of legitimacy.

The relocating of authority precipitated by the structural crises of states and governments at the national level occurs in several directions, depending in good part on the scope of the enterprises people perceive as more receptive to their concerns and thus more capable of meeting their increased preoccupation with the adequacy of performances. In many instances this has involved "downward" relocation toward subnational groups---ethnic minorities, local governments, single-issue organizations, religious and linguistic groupings, political factions, trade unions, and the like---which, in turn, have become increasingly aware of their growing coherence and clout, an awareness that elsewhere I have suggested has brought the world into a vigorous age of subgroupism.[12] In some instances the processes of authority relocation has moved in the opposite direction toward more encompassing collectivities that transcend national boundaries. The beneficiaries of this "upward" relocation of authority range from supranational organizations like the European Community to intergovernmental organizations like the International Labor Organization, from nongovernmental organizations like the Greenpeace to professional groups such as Medecin sans Frontiers, from multinational corporations like IBM to inchoate social movements that join together environmentalists or women in different countries, from informal international regimes like those active in different industries to formal associations of political parties like those that share conservative or socialist ideologies---to mention but a few types of larger-than-national entities that have become

---

[12]For an analysis of how weakened governments have operated as a major source of subgroupism, see Rosenau, *Turbulence in World Politics*, Chap. 14. The theme that the world has entered the age of subgroupism is elaborated in James N. Rosenau, "Notes on the Servicing of Triumphant Subgroupism," *International Sociology*, Vol. 8 (March 1993), pp. 77-90.

the focus of legitimacy sentiments. Needless to say, these multiple directions in which authority is being relocated serve to reinforce the tensions between the centralizing and decentralizing dynamics that underlie the turbulence presently at work in world politics.

In short, the emergent global system rests on an increasingly fluid pecking order. Although still hierarchical in a number of respects, the weakening of states and the pervasiveness of authority crises has rendered the pecking order more vulnerable to challenges and more susceptible to changes. Put differently, with states weakened by paralysis and stalemate, the power equation underlying the pecking order has been substantially altered. Where raw elements of power---armies, oil deposits, agricultural production, etc.---were once the major terms of the equation, now their values have declined relative to such complex terms as societal cohesion, the capacity to draft soldiers, decisiveness in policy-making, and the many other components of a country's ability to surmount authority crises and avoid paralyzing political stalemates.

It follows that any organization founded on clear lines of command and unquestioned compliance with orders is presently being undermined. Such a process is already evident in perhaps the most disciplined organization extant today, the Mafia,[13] and it can also be discerned in many, if not all, armed forces. Or at least it is sufficiently manifest to conclude, as will be seen, that the transformation of the macro-micro parameter has weakened military establishments as well as the states they serve.

THE MACRO PARAMETER: A BIFURCATION OF GLOBAL STRUCTURES

For more that three centuries the overall structure of world politics has been founded on an anarchic system of sovereign nation-states that did not have to answer to any higher authority and that managed their conflicts through accommodation or war. States were not the only actors on the world stage, but traditionally they were the dominant collectivities; they set the rules by which the others had to live. The resulting state-centric world evolved its own hierarchy based on the way in which military, economic, and political power was distributed. Depending on how many states had the greatest concentration of power, at different historical moments the overall system was varyingly marked by hegemonic, bipolar, or multipolar structures.

Today, however, the state-centric world is no longer predominant. Due to the skill revolution, the worldwide spread of authority crises, the impact of dynamic technologies, the globalization of national economies, and many other factors, it has undergone bifurcation.[14] A complex multi-centric world of diverse, relatively autonomous actors has emerged, replete with structures, processes, and decision rules of its own. The sovereignty-free actors of the multi-centric world consist of multinational corporations, ethnic minorities, subnational governments and bureaucracies, professional societies, political parties, transnational organizations, and the like. Individually, and sometimes jointly, they compete, conflict, cooperate, or otherwise interact with the sovereignty-bound actors of the

---

[13] "The Columbo family civil war . . . is solid evidence of a widespread phenomenon: the breakdown of autocratic leadership and dissension in the lower ranks. . . . The system of dictatorial control and unflinching loyalty in all of the families . . .is fracturing in the same way that the Soviet Union suddenly collapsed." Selwyn Raab, "In the Mafia, Too, a Decline in Standards," *New York Times*, January 19, 1992, Sec. 4, p. 6.

[14] A full analysis of the diverse sources of the bifurcation of global structures can be found in Rosenau, *Turbulence in World Politics*, Chaps. 10-15.

state-centric world.[15] Table 2 delineates the main differences between the multi-centric and state-centric worlds.

In sum, and to reiterate, while the bifurcation of world politics has not pushed states to the edge of the global stage, they are no longer the only key actors. Now they are faced with the new task of coping with disparate rivals from another world as well as the challenges posed by counterparts in their own world. A major outcome of this transformation of macro structures is, obviously, a further confounding of the hierarchical arrangements on which world politics is based. Not only have authority crises within states rendered the international pecking order more fluid, but the advent of bifurcation and the autonomy of actors in the multi-centric world so swelled the population of entities that occupy significant roles on the world stage that their hierarchical differences were scrambled virtually beyond recognition well before the end of the Cold War intensified the struggle for international status.

THE NEW GLOBAL ORDER: ENDURING OR TRANSITIONAL?

However the new global order may be labeled---and the designation is not a trivial exercise[16]---one conclusion derived from the foregoing analysis stands out. While the new order is marked by a high degree of uncertainty and dynamism, these features may not be transitional. It is tempting to conclude otherwise, to view the present era of turbulence as temporary, as a necessary process through which parameters get redefined and settle into a new set of premises. After all, it could well be reasoned, the ideational foundations of a new order and the habitual modes on which it rests do not automatically fall into place, so that the period between the end of one order and the evolution of a new one is bound to be disruptive as people cling to old ways of doing things in the face of new circumstances. Time is needed for experimentation, for trial and error, for sorting out alternatives, for actors with different learning curves to arrive at the same plateau on which their new relationships can flourish. Accordingly, the argument concludes, it will surely require a long transitional period before the outlines of the new order, much less the order itself, come fully into focus. Indeed, it may even take a while before it is clear that the old order has fully passed into history.

There is surely much validity in this reasoning. The attenuation of mental sets, the collapse of paradigms, and the abandonment of structural constraints certainly occurs with much greater speed than the subsequent processes through which new orientations and structures are formed and become deeply rooted. History brilliantly affirms that it is easier to destroy institutions than it is to construct their replacements. Nevertheless, it may well be that today's uncertainties and dynamics are not as temporary as logic dictates and as observation suggests, that the changes at work in world politics are such that there is no reason to expect the slow evolution of practices and processes on which the stabilities of a new order will rest.

Conceivably, in other words, the uncertainties and dynamics of the present period are permanent rather than transitional features of the new order. Why? Because the parametric transformations are all in the direction of enduring commotion rather than stable patterns. They do not point to the emergence of new political entities that can

---

[15]For an explanation of why the terms "sovereignty-free" and sovereignty-bound" seem appropriate to differentiate between state and nonstate actors, see Rosenau, *Turbulence in World Politics*, p. 36.

[16]For a discussion of the problem of labeling the order, see the appendix to Rosenau, "The New Global Order: Underpinnings and Outcomes" (xerox).

supplant the state as effective means of achieving societal cohesion and progress. They do not hint at the development of global structures that can accommodate both the decentralizing dynamics operative within the state-centric world and the centralizing dynamics at work in the multi-centric world. They do not in any way suggest that more analytically skillful citizens and publics are likely to be impressed with the intractability of most of the issues on the global agenda and thus be accepting of leaders whose performances are bound to fall short of their expectations. Rather the central tendency in the case of each parameter involves movement toward end points that are inherently and profoundly pervaded with uncertainty and dynamism, with impulses to sustain change rather than settle for new equilibria, with a potential for restless dissatisfaction with power balances and continuing resistance to whatever pecking order may seem to prevail.

In short, the most powerful forces underlying the emergence of a new global order are all conducive to persistent, long-term tensions between the need for more centralized international institutions and the equally compelling need to develop more decentralized domestic institutions. These tensions can be readily discerned in every part of the world today, in the tendencies toward strengthened regional organizations (e.g. in Europe and Latin America) and in those fomenting authority crises within countries. The fact that the Soviet Union and Yugoslavia came apart internally even as both sought to become increasingly linked externally to international organizations offers quintessential examples of how fragmentation and integration are both central characteristics of the new global order. And these are only the more conspicuous of a multitude of illustrations that could be cited.

ARMED FORCES IN A TURBULENT WORLD: A PARAMETRIC ANALYSIS

Although brief, the foregoing conception of the dynamics of present-day global turbulence enables us to formulate incisive questions with which to probe military organizations as dependent variables: what changes have they undergone with the advent of a bifurcated world of weakened states, intensified subgroupism, authority crises, and more analytically skillful citizens? Have the changes been the same for militaries everywhere or can significant regional and country differences be identified? Have the strict hierarchical foundations and rigorous commitment to disciplined command structures of military organizations enabled them to withstand the strong currents of turbulence? Or have they, too, been swept along by the powerful forces of change? Can signs of the skill revolution be discerned in the behavior of enlisted men and officers? Are military organizations undergoing crises of authority and turning to forms of subgroupism? Has the ever-expanding complexity of a bifurcated world resulted in a greater diversity of tasks undertaken by armed forces? In short, have they managed to remain essentially constant---beacons of stability in a fragmenting, unstable world---or is their conduct expressive of discernible and significant variation, thus affirming our underlying premise that no domain of human affairs has remained immune to the vast transformations of our time?

Developing initial responses to these questions perforce requires reliance on several kinds of data. A number and variety of empirical indicators have surfaced in recent years, but systematic inquiries derived from the turbulence model have yet to be undertaken. Unsystematic as they may be, however, the available data are sufficiently suggestive to allow for tentative interpretations and the framing of hypotheses designed to generate more rigorous findings.

At first glance, that is, it seems clear that change is stirring upheaval within military institutions. Notwithstanding adherence to the canons of analytic caution, one cannot help but be impressed by the continuing stream of events indicative of how the transformation of all three parameters has introduced variability into military affairs. Indeed, they readily

Table 2: Structure and Process in the Two Worlds of World Politics *

	State-centric World	*Multi centric World*
Number of essential actors	Fewer than 200	Hundreds of thousands
Prime dilemma of actors	Security	Autonomy
Principal goals of actors	Preservation of territorial integrity, and physical security	Increase in world market shares, maintenance of integration of subsystems
Ultimate resort for realizing goals	Armed force	Withholding of cooperation or compliance
Normative priorities	Processes, especially those that preserve sovereignty and the rule of law	Outcomes, especially those that expand human rights, justice, and wealth
Modes of collaboration	Formal alliances whenever possible	Temporary coalitions
Scope of agenda	Limited	Unlimited
Rules governing interactions among actors	Diplomatic practices	Ad hoc, situational
Distribution of power among actors	Hierarchical by amount of power	Relative equality as far as initiating action is concerned
Interaction patterns among actors	Symmetrical	Asymmetrical
Locus of leadership	Great powers	Innovative actors with extensive resources
Institutionalization	Well established	Emergent
Susceptibility to change	Relatively low	Relatively high
Control over outcomes	Concentrated	Diffused
Bases of decisional structures	Formal authority, law	Various types of authority, effective leadership

highlight succinct answers to the foregoing questions: Yes, the indicators suggest, militaries everywhere have undergone substantial changes and, yes, regional and country differences in the pace and direction of change are also noteworthy. No, armed forces in most countries have not been able to withstand modifications of their strict hierarchical foundations and disciplined command structures. Yes, signs of the skill revolution are manifest in the behavior of military personnel. Yes, military organizations virtually everywhere are undergoing authority crises and resorting to forms of subgroupism. Yes, many armed forces are taking on a diversity of new tasks. And yes, there are good reasons to continue to presume that the military have been no more immune to the dynamics of turbulence than any other societal institution.

In order to elaborate and justify these overall interpretations, the pervasive traces of parametric transformation evident in the conduct of military personnel and the structure of military establishments are examined through a two-track research strategy, one that is global in scope and focuses on a few dimensions of each parameter and a second that is region- and country-specific and investigates the impact of turbulent conditions on selected problems faced by the militaries of the two former superpowers, four countries in East-Central Europe, four in Western Europe, and three in Asia. In the case of parametric changes at the micro level, the ensuing analysis probes how expanded analytic skills have affected the orientations of officers and enlisted personnel alike and how the need for sustaining the skill revolution has posed a delicate challenge to the command structure of military organizations. The transformation of the macro-micro parameter is explored in terms of the impact of global authority crises upon the exercise of military discipline and the capacity of armed forces to maintain and replenish their ranks. The changes stirred by the bifurcation of the macro parameter are briefly assessed in terms of old roles being shed and new tasks being shouldered by armed forces, the constraints imposed by the emergence of global norms and vigorous transnational social movements, and the tendencies toward subgroupism within and across military ranks. In the context of these parametric assessments, the analysis then turns to region-specific comparisons of the problems of mililtary personnel, national strategies, and force-employment doctrines confronted by thirteen countries since the end of the Cold War.

Since the transformative consequences of each parameter are interactive, as previously noted, the order in which we assess the various dimensions of the military as a dependent variable matters little and should not be viewed as reflecting an assumption as to which change dynamics are primary and which are secondary. The analysis begins with transformations at the macro level because these encompass the broadest array of phenomena, but this is not to imply that the macro circumstances with which armed forces must cope are the prime determinants of their conduct.

DIMINISHED ROLES AND NEW TASKS

The bifurcation of world politics is conceived as reflecting an ever-growing interdependence in which centralizing and decentralizing tendencies at all levels of political aggregation reinforce, offset, or otherwise sustain global affairs. One consequence of this complexity is that armed forces are becoming more marginal even as their capabilities have become more relevant. That is, the weakening of national states, the proliferation of subnational organizations and groups in the multi-centric world, the shift of systemic agenda away from security and toward economic issues, the redirection of numerous adversarial relationships within regions and countries (as well as between former superpowers), the contraction of military budgets---to mention only a few of the dynamics at work---has led societies to be less reliant upon and less respectful of their military institutions even as the very complexity that undermines their reliance leads them to seek

out their militaries to perform new tasks that are also a consequence of greater complexity and extensive change.

This paradoxical pattern of lesser reliance and expanded tasks derives, in effect, from the combination of economic recession, war weariness, and shifting norms which make the conduct of military operations less attractive. No longer are elites and publics inclined to view military actions as a solution to problems and, indeed, in some cases such actions are considered to be a major source of the difficulties with which people have to contend.[17] High-tech weapons may allow for the quick defeat of a menacing enemy, but they are of no value in controlling the many enduring problems that continue to unfold away from the battlefield. It is no accident, therefore, that a number of wars have ground to a halt in recent years; each of these various situations had its own unique dynamics, but it seems clear that each also ran afoul of humankind's lessened tolerance for prolonged combat and its greater appreciation of the limits of military effectiveness.[18] So there is less for armed forces to do---to protect, to threaten, to prepare for---and as a result their roles in governmental decision-making and societal affairs have undergone considerable attrition. On the other hand, the very same combination of economic recession, war weariness, and shifting norms has given rise to a diversity of challenges that only the military, being well organized and still in command of substantial resources, seem competent to meet. Troops of NATO, for example, were used to deliver emergency supplies to the people of the former Soviet Union. Similarly, the U.S. military was asked to take on the task of preparing shelters, sanitary facilities, and medical care for thousands of Haitians fleeing their country, a role that was widely viewed by defense officials as "a headache" but that was nonetheless accepted.[19] Subsequently, a similar request to take on a new leadership role in the war against drugs, made precisely because of its expertise in creating "a unified command authority," was rejected by the U.S. military, and one of the reasons for the rejection suggests that the adaptation of service personnel to their diminished roles and new tasks is far from easy:

> Its reluctance now to take on a bigger role was described ... as a consequence, in part, of the Persian Gulf War, which made some military officers scornful of mere anti-drug operations. But it was said to reflect also a Pentagon wariness about becoming too closely identified with the failure to make inroads against a potentially intractable problem.[20]

In addition to new roles in the fields of humanitarian assistance and drug control, militaries in various parts of the world are increasingly likely to be called upon to take on peace-keeping responsibilities. With the dynamics of bifurcation and shifting values toward international organizations thrusting the United Nations into the limelight as an instrument

for coping with both intrastate and interstate conflicts,[21] more and more countries will be asked to contribute personnel to such missions. For those involved these new supranational tasks are likely, when combined with the growing incentives to honor subnational values, to confound further the increasingly complex question of the goals and purposes for which national military organizations are designed to serve and sacrifice (see below). Not only have militaries had to adjust to an obfuscation of their enemies, but the advent of turbulence in world politics has also beclouded the identity of their superiors.[22]

GLOBAL NORMS AND SOCIAL MOVEMENTS

The spread of global norms and the greater coherence and effectiveness of social movements constitute additional constraints on the military stemming from the transformation of the macro parameter. More precisely, one norm, human rights, and several social movements, particularly the peace, womens', and environmental movements, have tended to narrow the freedom of action that armed forces have historically enjoyed. The efforts of the Organization of American States to hold members of the Haitian military accountable for their atrocities, the finding of Mexico's National Commission on Human Rights that a senior army general "bore the major responsibility" for the deaths narcotics agents,[23] and the court convictions of former East Germany border guards for explicitly violating the human rights of would-be escapees are recent examples of how a growing global concern for rights of individuals is subjecting military personnel to new forms of scrutiny and condemnation.[24] It seems probable, too, that the increasing reluctance (noted below) of military officers to order their troops to fire on fellow citizens gathered for protests in town squares is, at least in part, a consequence of the emergence of human rights as a global norm.

In a like manner, the pressures generated by various social movements, all of them transnational in scope and global in appeal, have added to the limitations within which armed forces must operate.[25] Just as the peace movement contributed to the diverse challenges to military authority discussed below, so has the worldwide preoccupation with the role of women encouraged many countries to open combat roles in their officer and enlisted ranks to females. Between the late 1960s and the early 1990s, for example, the

[24]For a more general assessment indicating that the military are far from alone in having to adjust to the emergence of global norms, see James N. Rosenau, "Normative Challenges in a Turbulent World," *Ethics & International Affairs*, Vol. 6 (1992, p. 1-19.

[25]For a cogent analysis of the increasingly central role played by social movements in world politics, see R.B.J. Walker, *One World, Many Worlds: Struggles for a Just World Peace* (Boulder: Lynne Rienner Publishers, 1988).

proportion of women in NATO forces rose from 2 percent to 7.4 percent,[26] a pattern that has presumably been further reinforced by the exemplary performance of American women soldiers in the Persian Gulf War. At the same time it is also clear that the adjustment of military men to the arrival of female compatriots has not been easy. To cite just one instance, the feminist movement has reshaped the macro context in which military routines are sustained by the Corps of Cadets at Texas A&M University: not only was it charged with mistreatment of its female members, but for the first time an outside group was given the authority to examine the corps' policies and to suggest policy changes.[27]

SUBGROUPISM

The opportunities afforded by the evolution of the multi-centric world and its incentives to seek subgroup coherence and privileges has not been lost on more than a few armed services. In effect, many appear to have broken a long tradition in which they operated as a tightly-knit elite acting quietly behind closed doors, pressing policies, pulling levers, or otherwise exercising influence. Historically, that is, the military has acted as an agent of the state, either protecting its civilian leaders from perceived adversaries or, in some instances, replacing them on behalf of perceived needs for order. With the transformation of the macro parameter, however, the military have moved from behind closed doors into the public arena, acting not as agents of the state but as claimants on its resources, much like the other subgroups that populate the multi-centric world.

In short, where subgroupism within armed services used to refer to the cohesion of a governmental elite, now it also connotes the plaintive demands of a besieged subgroup outside the prevailing power structure. Where the military could readily co-opt other groups in the private sector, now they have to compete with them; and, in so doing, they have also come to emulate them. Notwithstanding the constraints of a long-standing commitment to organizational discipline, military leaders have been increasingly emboldened by the diminution of their funds, prestige, and tasks to seek redress through the rowdier methods of aggregation used by other actors in the multi-centric world. In Russia, for example, officers came together to concert their demands, which included the issuance of a call for coverage by nationwide television and the formation of a "coordinating council" to represent their interests.[28] While some might dismiss the subgroupism of the military in the former Soviet Union as a special case resulting from a particularly sudden and unexpected set of events, it is equally plausible, given the bifurcation of global structures, that subgroupism among militaries elsewhere is likely to increase in proportion to their loss of status, support, and perquisites.[29]

This is not to say, of course, that turbulent conditions have brought an end to the readiness of all militaries to eschew use of their instruments of coercion in favor of conventional subgroup behavior. Both successful and failed military coups d'etat will

doubtless continue to mark the political scene---if only as last, desperate measures to cling to privilege---but the politicization (can we dare call it a demilitarization?) of armed forces does seem likely to grow as their roles diminish and as the war weariness of publics deepens. Viewed in this way, the decisions taken by the military within both the government and revolutionary movement of El Salvador to reverse course and compete through parties and elections stand out as a dramatic indicator of this underlying global trend.

THE REDEFINITION OF INTERESTS

Turning now to the transformation of the micro parameter, it is useful to stress again that all the parametric changes are interactive. While the orientations of individuals in the military have certainly been shaped by the foregoing macro circumstances, so has the enlargement of their analytic skills depicted below resulted from the operation of dynamics at the micro level which, in turn, have been a source of the macro changes.

Among the numerous indicators of the skill revolution having an impact on armed forces, perhaps the most noticeable consequence of a transformed micro parameter can be found in the expansion of the skills with which both enlisted and officer personnel assess their own interests. Traditionally military persons devoted little energy to pondering their personal interests. Rather, a deep-seated habit prevailed through which self-interests were equated with service and national interests. Now, however, there are numerous signs that enhanced analytic skills have led to a disaggregation of the concept of self-interest. If the concept of expanded analytic skills is operationalized as a greater capacity to play out scenarios that locate where individuals fit in the processes of world politics,[30] it is not difficult to uncover widespread indicators of members of armed forces being preoccupied with their changing roles. For the most part, this preoccupation takes the form of distress over the loss of support, tasks, and perquisites, and in turn the distress is most manifest in a seemingly increasing readiness of servicemen and women to attach higher priority to their own welfare than to the military organizations or countries they serve. The plaintive lament of the Russian colonel quoted in the opening epigraph is echoed not only in the words of many individuals in the military of the former Soviet Union, but comparable statements can be found in the expressions of counterparts in other countries that are scaling back their armed forces in the face of budget cuts and the end of Cold War rivalries. Consider for example, the words of U.S. Vice Admiral Leighton W. Smith, Jr., the deputy chief of naval operations: "My biggest concern is they'll pull the rug out from under us and we'll go into an undisciplined free fall."[31] Or ponder the observation of Roger Spiller, a professor of military history at the U.S. Army's Command and General Staff College: asked for a reading of the present mood of the military, he responded that "I think there's a good deal of anxiety. They'd have to be completely insensitive not to feel anxiety about the impending reductions in the Army. These are men and women acutely aware of their surroundings, which right now are rather hostile to their future plans."[32]

The growing preoccupation of military personnel with their own welfare is, of course, a violation of the traditional stereotype wherein the good soldier is supposed to accept unthinkingly whatever decisions their military and civilian superiors make with

[32]*Ibid.*

respect to their status and activity. This conception of military command structures lies at the very heart of combat readiness and effectiveness. Yet, nowhere can one find traces of it being voiced by either government officials or top-ranking officers. Some may be good soldiers in the sense that they are "remarkably philosophical" and "understand what is happening and the reasons for it,"[33] but few if any have publicly affirmed that the military is duty-bound to accede to the changes initiated by their political superiors. Indeed, it is a measure of how profoundly the military have been caught up in the parametric transformations at work in world politics that all concerned, including those of us who analyze military institutions, take for granted that military personnel are no longer silent and obedient with respect to their own welfare. Not long ago, for example, the effort of Russian President Yeltsin to win over disgruntled officers by publicly offering them 120,000 apartments and 70,000 quarter-acre plots[34] would have seemed absurd, a form of public bargaining entirely out of place in a military context. Today, however, such an offer seems more commonplace than anomalous, a cogent indicator of how fully the analytic skills of military personnel are no longer treated as a constant in the political equation.

The most obvious trace of the skill revolution's impact is to be found in fragmenting countries, where the ethnic identification of military personnel is fostering the same kinds of divisions among them that divides their societies. The army in Algeria, for example, is considered to be "crossed by the same currents that cross Algerian society," with the top command "being dead set against the [Muslim] fundamentalists," but this perspective changes "as you travel down the ranks."[35] Similarly, Ukraine's insistence that members of the armed forces stationed on its territory sign loyalty oaths bespeaks a recognition that enlisted personnel and officers are no longer dutiful, that they are inclined to analyze their situations, sort out their loyalties, and then to follow the course most appropriate to their personal commitments. And that is exactly what transpired. As one analyst put it, military units and many officers are "following their paychecks" to republican governments, with the result that "Soviet conscripts, more and more, are serving within the boundaries of their home republics in a process of homogenization."[36] But it is a homogenization that stems from decentralizing dynamics, the potential of which is poignantly revealed by the fact that the Black Sea Fleet of the former Soviet Union consisted of people of 46 nationalities and that some of its ships had sailors of as many 25 nationalities.[37] Put even more poignantly, with the ethnic fragmentation of the Soviet military, "fathers are worrying about facing their soldier sons across a battlefield, if they end up serving different states. Officers are watching the unity of their troops give way to ethnic enmity."[38]

It would be a mistake, however, to view the disruptive consequences of the greater capacity of military personnel to extend their analytic skills beyond the boundaries imposed

by the canons of strict military discipline as confined to the enlisted ranks. The unity of top military leaders has also been splintered by the skill revolution. Or at least there are good indications that high-ranking officers are no more uniform in their underlying political attitudes than any other occupational elite, that the new license enjoyed by military personnel of all ranks to think analytically---to locate for themselves where military institutions fit in the panoply of societal dynamics---would appear to be as much a source of divergent perspectives as of widely shared consensuses among leaders of defense establishments. Even as many senior officers of the former Soviet Union, for example, gave expression to decentralizing tendencies and opted to give higher priority to their ethnic loyalties, so did others articulate centralizing values and pressed for the maintenance of the military as a single, united command structure. Likewise, just as some took a right-wing position favoring the use of strong-arm techniques to restore order, so did others resist the militant posture and voice support for democratic procedures.[39]

In short, the enhancement of analytic skills among military personnel seems likely to undermine rather than reinforce traditional command structures. The roles played by top Soviet military leaders on both sides of the August coup and its subsequent failure is perhaps even more eloquent testimony against the presumption that military elites have somehow managed to avoid the divisive consequences of a transformed micro parameter.

TECHNOLOGY AND THE EXPANSION OF ANALYTIC SKILLS

Nor is the evidence of greater analytic skills on the part of military personnel due only to the way in which turbulent conditions have heightened their self-interests. The increasingly technological nature of warfare has also contributed to their capacity to play out self-interested scenarios. High-tech weaponry cannot be operated by poorly educated and unskilled soldiers or sailors. Considerable advanced training is required to man modern weapons, thus necessitating that military institutions convert their recruits from physically able individuals to skilled technicians. And once they do, once enlisted personnel are competent to use and repair computers, complex targeting devices, intricate photographic equipment, and the other modern devices through which the instruments of war deliver their loads, the raw recruit is no longer an unthinking individual incapable of pondering cause and effect or discerning the diverse routes through which desired outcomes are produced. Rather, having been tooled up in high-tech forms of warfare, he or she is possessed of new analytic capacities that can readily be extended into other, more political realms.[40]

A quintessential insight into the relevance of the skill revolution for military personnel is provided by the spate of TV advertisements in which the U.S. armed forces stress the educational opportunities of military service. Designed to recruit volunteers, the advertisements concentrate on the subsequent, post-service uses to which technical skills acquired in the armed forces can be put, the underlying message being that one leaves the services a much more analytically competent individual than one was before joining. The same insight is implicit in the complaints of former Soviet officers who were assigned young

nonRussian-speaking draftees from Central Asia to operate complex, modern missile equipment.[41]

For closed and authoritarian societies like China the necessity of implementing a skill revolution poses a difficult challenge. Indeed, it has been the focus of considerable debate among Chinese leaders. On the one hand, the importance of high-tech weapons in the success of U.S.-led coalition against Iraq made clear to them that they would have to bring the skill revolution to their own armed forces if they wanted to be able to engage in modern warfare. At the same time it was equally clear that by pushing science, technology, and professionalism in their armed forces they would be risking ideological control, that the more sophisticated their fighting forces became, the less vulnerable they would be to manipulation by the party. The 1989 pro-democracy protests in Tiananmen Square highlighted this dilemma and intensified the debate inasmuch as it was poorly educated troops from the countryside who fired on the demonstrators. Had the troops been recruited from urban centers, trained to operate modern weapons, or otherwise exposed to the skill revolution, some reasoned, they may well have refused to fire on the students. In effect, the potential transformation of the micro parameter has compelled Chinese authorities to face the question of who they deem their enemies to be. As one diplomat put it, they have to decide whether the main threats are posed by the democracy movement and "peaceful evolution" or by foreign invasion:

> Are you going to have a million Soviet soldiers come streaming across the border? Are you going to engage in a high-tech war with Taiwan or the United States? Or are you going to face Tibetans and students? If you perceive your major strategic enemy being inside your own country, then your major concern is for political control."[42]

Furthermore, it can be readily argued that even this dichotomous choice may be short-lived. As the skill revolution spreads to the countryside through global television, satellite dishes, fax machines, and a host of other means, the political reliability of troops from rural areas may diminish accordingly.

For those many countries that are not so preoccupied with political control, the nature of modern warfare is tipping the balance ever more in the direction of sustaining the skill revolution in their armed forces. While 83 of the 140 countries with military forces employ some form of conscription, many are now reducing the number of conscripts and the length of their service in favor of recruiting volunteers and professionals.[43] This pattern is partly due to economic constraints that limit the funds available for large militaries, but it would also seem to be very much a consequence of the technical requirements of battlefield readiness.

The implications of these technical requirements for command structures and the maintenance of military discipline are considerable. As the ensuing analysis indicates, the surfacing of authority crises within armed forces can be traced back, in part, to the enlarged capabilities of their personnel. It even seems plausible to conclude that, given the know-how required to operate modern weaponry, the transformation of the micro parameter is

likely to have a quicker and more extensive impact upon members of armed forces than any other segment of the citizenry.

THE DECLINE OF DISCIPLINE AND THE EROSION OF OBEDIENCE

Given the refinement of skills at the micro level and the diminished roles, new tasks, global norms, subgroupism, and the many other dislocating constraints that have emerged at the macro level, it is hardly surprising that the transformation of the macro-micro parameter has had major consequences for armed forces everywhere. Again, however, this is not to imply that the numerous signs of authority crises within armed forces and between them and the societies they serve are only a consequence of changes at the other levels. To repeat, the parametric transformations are interactive, with the decline of military discipline and the recasting of command structures serving to reinforce the subgroupism and sharpen the skills of officers and enlisted personnel alike.

It is especially easy to discern changing hierarchical relationships within armed forces and between them and the societies they serve because the traditional command structures of military organizations are so straightforward. At every rank military personnel are supposed to obey the orders of their superiors and, in turn, the defense establishment is supposed to comply with the directives issued by chief executives and their civilian agencies. This ideal of a responsive and responsible military is built into every aspect of military organization, with the wearing of uniforms bearing insignia designating rank and the saluting of those with higher rank being only the more obvious indicators of pervasive hierarchy. To be sure, variability marks the extent to which different armed forces have achieved this ideal, with those in the developed world having been more successful in establishing tight command structures founded on habitual obedience than those in the developing world; but irrespective of the hierarchy achieved in the past by particular countries, all of them appear to be undergoing an erosion of traditional discipline in the present turbulent era.

The authority crises that beset military establishments take several forms. A lesser form, one that may not even escalate into crisis proportions, derives from the fact that no military establishment today can avoid the impact on command structures of its increasing reliance on technical expertise to operate its weaponry. The conventional lines of authority do not follow the distribution of expertises among the ranks. Often highly skilled technicians have to report to less knowledgeable superiors and, as a result, the former may be confronted with situations where they have to ignore their orders and inform their superiors they are wrong. Conversely, frequent may be the occasions when the superiors have no choice but to follow the lead of their more skilled subordinates.

A more obvious and consequential type of authority crisis occurs when an elite officer corps defies constitutional principles and seizes power. While this classic case of military-inspired coups d'etat need not detain us here---since it preceded the onset of turbulence and is the subject of a substantial literature---there is one turbulence-generated gap in the coup literature worthy of note: as will be seen, the classic case is likely to occur less and less often. The inhibitions against outright seizures are not so great as to rid world affairs of actual or failed coups---as recent events in Haiti and Venezuela demonstrate---but the advent of parametric change does seem likely to give pause to military elites contemplating illegal takeovers and thus reduce their frequency.

But we do need to examine the more complex and historically atypical forms of authority crisis fostered by the transformation of the macro-micro parameter. Perhaps the most conspicuous of these concerns the capacity of military organizations to maintain and replenish their ranks. Resistance to being drafted by new recruits and desertions by those

serving appear to have become more commonplace in recent years. Although in some countries military service is viewed as a way to move out of humble origins (such as among peasants in China), the opposite pattern is more predominant. In most countries, and especially those at war, the proportion of young people who resist and evade being called into service appears to be growing. The figures may not alarm military planners, but the changes are apparently enough for service chiefs in many countries to recommend cutting back on drafts of conscripts and relying more heavily on volunteer personnel.44 The pattern of draft resistance is also evident in a U.S. Supreme Court decision to shut the door on thousands of asylum claims from young men trying to escape conscription by guerrilla or government forces in strife-torn countries of Central America and Asia.[45] In Germany, a sudden explosion of citizens registered as conscientious objectors occurred as the coalition against Iraq seemed increasingly likely to follow the military option, and a comparable pattern surfaced in Switzerland even though the Swiss make no provision for alternative service, thus compelling resisters to be willing to go to jail.[46] In South Africa, too, draft resistance has intensified as the abolition of the law classifying every citizen according to race led white draftees to question compulsory conscription for whites when the law defining them as white no longer existed.[47] Similarly, when Serbia tried to strengthen its forces against Croatia by mobilizing its reservists, thousands evaded the draft."[48] And even in Japan, which is constitutionally prohibited from assigning its Self-Defence Force (SDF) to UN peace-keeping operations and which limits the ranks of the SDF to 300,000, the recruitment target has been difficult to meet despite pay increases, improved work conditions, and better barrack accommodations.[49]

Nor, of course, were the superpowers immune to this form of authority crisis. Its presence was quite noticeable even at those times when they went to war against a clearly defined enemy. Indeed, the spectacle of widespread resistance to service during the US effort in Vietnam and the Soviet campaign in Afghanistan may well have contributed to comparable patterns elsewhere. And as the pattern of draft resistance reached massive proportions in the former Soviet Union in 1989-1990---from 871 in 1987 to 6,667 in 1989 and 135,000 in 1990[50]---so did evading service come to be "seen by young people as

[46]These patterns are cited in unpublished 1991 paper by Lore Unt, "Draft Resistance in the Soviet Union," p.2. It is noteworthy that emerging global norms relative to human rights have also made the military's problem of draft evasion more difficult: both the European Parliament and the U.N. Human Rights Commission passed resolutions in 1987 specifying that conscientious objection to military service is a universal human right (*ibid.*).

normative behaviour, which met with parental approval and found tacit understanding, if not endorsement from Komsomol officials and law enforcement authorities."[51] It has even been said that the Soviets could not even consider direct military participation in the coalition against Iraq because of massive resistance to the idea at home, just as it took less than a week's time for the same resistance to compel the Kremlin to abandon mobilizing reserves in the Russian republic to retake control of Azerbaijan from militants.[52]

As authority crises have hindered the recruitment of military personnel, so have they made it more difficult for defense establishments to maintain their force levels. The readiness of those in enlisted ranks to desert, once an unthinkable idea entertained by a few isolated individuals, has increased noticeably in many parts of the world. Most recruits, of course, complete their tours of duty, but the number who do not is no longer infinitesimal. This is especially so in the armed forces of multi-ethnic societies, where greater analytic skills and subgroupism nursed by ethnic loyalties has sometimes resulted in extensive defections. When civil war came to Yugoslavia, for example, its Serbian dominated armed forces experienced more than 1,000 desertions by Croats and a quarter of its Slovenian conscripts,[53] a crisis that had devastating consequences for the Serbian campaign against Croatia: "The Croats bent but they didn't break, and in the end it was the army that fell into disarray."[54] Not only did the Serbian army encounter substantial opposition in mobilizing its reservists, but "those who were inducted seemed to have little stomach for battle; Western correspondents have seen army reservists refusing to leave their armored personnel carriers to engage the enemy."[55] In effect, because of the severity of its authority crisis, the Serbian "army's poor results belied its advantage in weaponry and equipment."[56]

As previously noted, somewhat similar developments marked the former Soviet Union when it fragmented into several republics. In this case the pattern was not so much one of desertion as that of troops shifting their allegiances from the central command to that of the republics from whence they came, with the result that the former was no longer in charge of a coherent fighting force. "People are sort of heading for home," one analyst observed. "The question is: what parts are still coherent and which parts are not? The staff arrangement at the center and the strategic nuclear forces are intact, but the ground forces and the military district system are completely undermined."[57] Another analyst described the effects of the authority crisis in the Soviet military even more cogently, noting that the decline of discipline and the erosion of obedience resulting from the inability of the country's national leadership to cope with change had drawn the military

> inward in a process she called "cocooning." They have sequestered themselves from the larger society and are concerned chiefly with hoarding food and supplies to survive the winter.... Officers and enlisted men show loyalty only to their immediate superiors. They respond to their own chain of command. The guy immediately above you is the guy you trust and the guy to whom you report.[58]

It is perhaps noteworthy that tendencies toward disobedience within enlisted ranks are reinforced by the activities of more analytically skillful citizens who pool their efforts on behalf of loved ones in the services. Anxious to protect their sons from the risks of warfare, for instance, parents have mobilized marches and other types of protests designed to exempt their sons from commitments that could risk their lives. Such protests often get considerable publicity, especially if the marchers consist of mothers, and thus add further to the authority crises they are designed to intensify. As the level of fighting increased during the Yugoslavian civil war, for example, officials of the Croatian government "found encouragement in the mothers of army conscripts who traveled by bus from the country . . . to protest in Belgrade the continued fighting."[59] Likewise, when casualty figures revealed that Montenegrins were paying a disproportionate price in lives, a finding that led to large student rallies and, in one instance, to families of 40 Montenegrin soldiers ordered to the front occupying the office of the Montenegrin President demanding the return of their sons.[60] Under special circumstances, moreover, the external incentives toward disobedience may originate with public officials. Authorities in the Baltic Republics are a case in point: when the Soviets sought to draft Estonian, Latvian, and Lithuanian youth into the armed service, the fledgling Baltic governments refused to acknowledge the legitimacy of the draft order and helped young people to disobey it. The result was that less than 25 percent of the draftees in each republic actually showed up for duty and in Lithuania the figure was 12.5 percent.[61]

The growing presence of what might be called the "loose cannon" phenomenon is still another indicator of authority crises within the military. This refers to individuals or small groups that decide to take matters into their own hands, defy orders, and engage in acts that have wide consequences. If draft-resistance and desertion are, so to speak, the passive form of the erosion of obedience within armed services, the loose cannon is the most active form. Of course, history is not lacking accounts of lose cannon, but it is hardly surprising that their number, variety, and impact appear to be greater with the onset of global turbulence. The very complexity and interdependence of modern societies renders them more vulnerable to a small coterie of individuals who seek to prevent events from evolving in certain directions or who aspire to movement toward different goals. Terrorists are in some ways illustrative in this regard, but they stand out as deviants from societal discipline, whereas military loose cannons deviate from a discipline that does not allow entertaining the idea of individual initiatives. So it is a measure of authority in crisis that accounts of loose cannon seem to surface with increasing frequency. A few examples indicate the breadth of the phenomenon. It was "rogue local units acting without authority"

that shelled the quintessentially medieval (and exquisite) city of Dubrovnik in Croatia,[62] just as a UN-brokered peace in Yugoslavia nearly came apart when an Air Force jet shot down a helicopter, killing its five European occupants who were monitoring a cease-fire accord, a breakdown of discipline that may have been initiated by a larger coterie of loose canon than those who undertook the action: as one Western diplomat put it, "The helicopter downing was not the responsibility of two pilots acting alone. The only question is how high up the chain of command the decision was made."[63] Similarly, momentum toward ending a four-year rebellion by an insurgent group in India, the United Liberation Front of Assam, was resisted and slowed down by several military commanders on the grounds that an earlier operation was blunted by the army's sudden withdrawal.[64] And even after peace was successfully negotiated in Angola, there remained a few loose cannons who could undo it: "Now thousands of idle young men without food remain near arms in the assembly points. Without guaranteed food, they will form banditry groups."[65] Even greater, of course is a worldwide fear of loose cannons in the former Soviet Union who have access to stored nuclear weapons and who for any number of reasons may be impelled to use them.[66]

This is not to imply that loose canon who break ranks ought necessarily to be judged harshly. One can readily imagine situations where their actions affirm one's own values and are thus worthy of applause. It was loose cannons in the national guard, for example, that initiated the process that led to the successful ouster of Georgia's authoritarian president, Zviad K. Gamsakhurdia.[67] Sometimes mutiny in the ranks of the military, in other words, might well be viewed as sacrifice and heroism. The point here is simply that loose cannon, whatever their desirability, reflect the breakdown of traditional lines of authority within armed forces and are thus an indicator of the turbulence to which they are presently exposed.

A final type of authority crisis worthy of notation concerns the central issue of domestic conflict in which armed forces are ordered to fire on their own people. The issue, of course, is as old as the use of organized coercion, but the historic pattern founded on strict military discipline is one in which militaries have not hesitated to obey the commands to fire. While the prime function of armies has been to wage war against international enemies, the past is scarred with numerous occasions when the line between police and military functions was obfuscated and the weapons were turned inward and aimed at domestic enemies. And few, if any, are those historic moments when the orders to shoot on fellow citizens were defied. However, with the advent of turbulence in the parametric controls that sustain the conduct of public affairs, and perhaps especially with the weakening of states and the evolution of global norms that attach high value to human

rights, there are solid indicators of a reluctance both to order attacks on fellow citizens and to comply with such orders. The 1989 collapse of the communist regimes in Eastern Europe is a conspicuous instance of this form of authority crisis. The collapse would not have occurred if the militaries in those countries had been ready to comply with orders to use force against their own people. The Ceausescu regime in Romania did issue such orders, but this exception affirms the central tendency. Leaders elsewhere in Eastern Europe, unlike Ceausescu, were aware of the authority crisis at work within their military, and they knew too that their publics would not tolerate such actions (as Ceausescu also found out at the expense of his life).

To be sure, some Soviet forces followed the orders of the coup leaders in August, 1991, and moved on the civilians who sought to protect Yeltsin at the Russian White House. Military support of the coup was short-lived, however, and the central role of the military in that episode was played by the tank battalion that rallied to Yeltsin's defense. But, some might argue, what about the roles played by the military in China and Burma? In both cases the army mowed down protesting citizens gathered in public squares and their political leaderships thereby managed to regain and retain political control. Are they not examples that stand out as indicators of the continued effectiveness of strict military discipline? Yes, of course, they are, but again they seem more the exception than the rule (and even in China there were unconfirmed reports that more than 1,400 soldiers and 111 officers above the rank of battalion commander who either fled the scene or defied the order to shoot in Tiananmen Square). Or at least there are enough instances of shifting values with respect to the avoidance of armed force against domestic publics to suggest that military personnel are beginning to set boundaries beyond which their disciplined responses in the command structure are no longer reliable. What has been said about the military in Yugoslavia might well be said about armed services in many other parts of the world: " . . . most of the army realizes they alone cannot hold Yugoslavia together at gunpoint. The army is only effective as a weapon when it is not used. They recognize that if the Yugoslav national army fires on the people, it loses all authority."[68]

STRATEGIES, DOCTRINES, AND PERSONNEL: A COMPARATIVE ANALYSIS

We turn now to the consequences of the several parametric transformations for military strategies and the personnel and doctrines available for the employment of force. Thus far we have not probed these aspects of military establishments, but they are both in a state of flux as downsizing to force levels typically one-third to one-half as large as Cold War authorizations continues in most countries. Hence these indicators seem especially suitable to a more empirical assessment of the changes wrought by turbulent conditions. Our method for this purpose is that of comparative analysis; our data consist of materials on thirteen countries in different parts of the world; and our goal is to identify the effects of turbulence on personnel and the cognitive, strategic and doctrinal uncertainties spawned by the parametric transformations.

To anticipate the main insights derived from this comparative inquiry, the data clearly suggest that the collapse of the Soviet Union has had ramifications for militaries everywhere, but that the impact of the Cold War's end has varied. The variations occur not so much with geographic distance from the continuing centers of world power, but with the functional ties and associations, or what might be called "policy distance." Thus impacts on military institutions have been relatively greater in Europe and North America than in Asia and the Pacific, Africa, and Latin America. At the same time, countries in the latter regions having close associations with (i.e., nearer in policy distance to) those North

---

[68]Stephen Engelberg, "Yugoslavia: Healing Steps Are Modest," *New York Times*, May 11, 1991, p. A3.

American and European countries most directly affected have themselves experienced relatively greater impact on their own foreign policy and defense establishments than countries less closely associated (or further away in "policy distance").

AMERICAN AND RUSSIAN MILITARIES IN A TURBULENT WORLD

As discussed above, few anticipated the authority challenge that the Red Army posed in August 1991 to the Communist Party and civilian leadership of the USSR. In retrospect the coup attempt seems less surprising than it seemed at the time, given what Daniel Papp describes as a "deterioration of civil-military relations" that preceded the event.[69] He notes how the military was used by Gorbachev not just "to combat crime in major Soviet cities," but also "to control an anti-government demonstration" in Moscow and to use "deadly force against Soviet citizens" in the republics, notably in Armenia, Azerbaijan, Georgia, and Lithuania. All of this contributed to a decline both in "the prestige of military service" and in "turnout for the Soviet draft." Erosion of military pay atop poor living conditions in military housing contributed to the regime's loss of legitimacy in military eyes.

In the aftermath of the abortive coup attempt and the subsequent breakup of the union, initial efforts to retain a central defense function at the new "commonwealth" level were resisted by the republics that saw in any such continued centralization a *de facto* subordination to Russia. Implementation of decisions on relinquishing control to Russia over nuclear capabilities was delayed, in large part because they came to be seen in Ukraine, for example, as an ultimate hedge against threats to continued national independence.

Although nuclear authority and control issues understandably have received the most publicity, massive dislocations of military members resulted from the withdrawals from Eastern Europe, "repatriation" of nationals to the militaries of their respective republics, and the necessary reorganization of military units and command structures that followed the demise of the union. Disorientation with value systems in flux, not to mention confusion over roles and missions in the post-Cold War republics, only added to the overall confusion.

U.S. adjustments to about a one-third reduction in force executed over several years, though substantial, have not been so dramatic. While to a lesser degree than in Russia and the other republics, the security of established military career paths in the U.S. has given way to the personal uncertainties produced by what is still the largest drawdown of standing forces in almost half a century (see Table 3). Accordingly, it is hardly surprising that there has been no abatement in the trend toward challenges to traditional authority patterns that has accompanied the development of technology-intensive forces and their highly skilled and increasingly politicized personnel. If anything, reduced force sizes and even greater reliance on technology will lead to continued (and perhaps increased) challenges to traditional expectations of unquestioned deference to military rank and position.

Resistance to changes in established values has also resulted in challenges to authority throughout the ranks. Commanders, for example, have been unwilling or

otherwise found it difficult to curb sexist practices directed against women. Though often treated bureaucratically as separate issues, controversies over sexism, sexual orientation, and gender roles are not easily separable when they are understood as challenges to authorities who remain committed to inter-related, traditional values as a basis for defining military institutions.

Table 3: Reductions in Military Personnel: The U.S. and Former Soviet Union Forces on Active Duty

	1989	1992	% Change
United States	2,124,900	1,913,750	- 9.9
Soviet Union/CIS	4,258,000	3,293,000	-22.7

For two decades during which expanded roles for women have been discussed seriously, movement was glacial---first opening service academies to women in 1976 and subsequently expanding non-combat (including aviation) career opportunities for women. That combat, particularly in the air and at sea, has become more technology- and less labor-intensive reduced the persuasiveness of physical-strength differences and other functional arguments marshalled to preclude women from assuming combat roles. Always significant in the debate, of course, has been a traditional, value-based opposition to the very idea of women in combat as being contrary to the established norms of society in general and its military institution in particular.

Sometimes overlooked is that advocacy of gender equality in the military by almost all women (and many, if not most, younger men) in uniform has been a challenge not just to traditional norms that defined the military ethos, but also to senior authorities who have held such values. It is significant that it is in the increased turbulence of the post-Cold War that this last formal career barrier to women has been challenged successfully in the navy and air force--the most technology-intensive of the services.

Not unrelated to female exclusion from combat, sexism, and anti-feminism is a pervasive homophobia throughout the ranks. As in the combat-exclusion issue, the sexual orientation question is usually addressed by senior officials on a functional ground--that homosexuality (or at least overt homosexuality) is prejudicial to the good order and discipline that make cohesive units effective in combat. Quite apart from the merits of arguments on either side of the issue, it is noteworthy that senior military officers have made direct political challenges to presidential authority on this question. Extraordinary

and uncharacteristic public expressions of disrespect for the president and selected members of Congress by military members of various ranks are further indications of how parametric transformations have impacted upon military institutions with the end of the Cold War.

Beyond challenges to authority observed in the armed forces of both the U.S. and Russia, military strategists and writers of force-employment doctrines predictably have been slow to adapt to the new and still changing post-Cold War circumstances. Since the late 1980s, Soviet doctrinal pronouncements have been used to cover over uncertainties with such ambiguous terms as "reasonable sufficiency," "comprehensive security," and "defensive defense." In some respects, such terminology--so subject as it is to multiple interpretations--can create the illusion of certainty through what amount to commonly accepted, politically approved slogans. It is through such means that attempts were made to accommodate objections raised by the military to new strategic views that departed from a customary Soviet military doctrinal focus on the offensive and counter-offensive.

Compounding these differences after the breakup of the union are disagreements among the former Soviet republics on the role nuclear and non-nuclear forces are to play in their separate national defense policies. Strategic and doctrinal uncertainties are, of course, part of the American post-Cold War experience as well. Lawrence Korb notes that "with the end of the Cold War . . . Americans are no longer sure what role they wish to play in the world or what type of military force they wish to support." He discusses four competing views held by American elites: (1) the neoisolationist "come home America" school; (2) the polar opposite of the first school--advocates of what would amount to a "pax Americana" on a global basis; (3) those who favor multilateralism and using force under the collective security mantle of the U.N.; and (4) what Korb calls a "pragmatic intervention" policy that "rejects the extremes of isolationism and world policeman as unrealistic, and collective security as utopian."

Korb notes that official documents posit the post-Cold War American military as dealing with strategic deterrence, forward presence, crisis response, and reconstitution of forces back to Cold War levels should a more threatening world return. There has been considerable confusion in specifying more precisely what these roles and missions involve and which forces are to perform them. As noted above, force-employment doctrine has tended to lag behind the reduction of forces already well underway.

Notwithstanding a disestablishment of such prominent organizational structures of the Cold War era as the Strategic Air Command, the role of nuclear weapons and the relevance or meaning of strategic deterrence in a post-Cold War world have not been addressed seriously, much less conclusively. Consistent with strategic uncertainty is the incrementalism in strategic and doctrinal thinking with force posture driven more by the shorter-term politics of the budgetary process than by any post-Cold War rethinking of concepts. Thus, the army is to have 10 divisions instead of 12, the air force 20 fighter wings instead of 26, and the navy 10 aircraft carriers instead of 12. In what seems to be something of a "1 1/2-war" approach, these forces could be committed to two regions simultaneously, winning in one and holding the line in the other, whatever that may mean in practical terms.

The absence of consensus on an appropriate rationale and modes for using force in the post-Cold War period results in an incremental groping or muddling through crises or other potentially military contingencies. Not only is such policy uncertainty reflective of continuing paramteric transformations, but it also lessens the predictability of the U.S. response to particular contingencies and thus adds further to the uncertainty of other actors. Thus do turbulent conditions beget more turbulence.

In sum, dealing with strategic and doctrinal questions in a complex, post-Cold War context has been extraordinarily difficult. Gone are the constants and relative stability of Cold War strategic thought on matters of war and peace. In personnel matters as in strategic thought there is a striking similarity in the American and post-Soviet experiences, however the parties may differ in their responses to global turbulence.

EAST-CENTRAL EUROPEAN MILITARIES IN A TURBULENT WORLDE[70]

The defense policies of East-Central European states have been affected dramatically by changes in variables at both international and state-society levels of analysis. Changes in the international environment since 1989 have affected the calculations of all states, but only those in East-Central Europe also experienced significant changes in regime and their domestic political economies even as ethnic and nationality differences in the region remain a core regional security concern. Formulation of defense policies in these countries has been caught in the interplay between these internal and external factors.

As is clear in Table 4, decisions to reduce rapidly and significantly the size of the armed forces in Poland, the Czech and Slovak republics, and Hungary are one readily observable result of this interplay. In the case of the less-than-complete Romanian revolution, however, the military establishment has been left more or less intact and, if reporting is correct, even larger in size in 1992 than in 1989. By contrast, personnel in military establishments in the other countries have suffered to a considerable degree as a consequence of having to adjust to the new circumstances created by the kind of downsizing they have experienced.

Table 4: Reductions in Military Personnel on Active Duty in East-Central Europe

	1989	1992	% Change
Czechoslovakia	199,700	145,800	- 27.0
Hungary	91,000	80,800	- 11.2
Poland	412,000	296,500	- 28.0
Romania	171,000	200,000	+ 17.0

Source: International Institute for Strategic Studies

The adjustment problems are especially conspicuous in Poland. Since the military under Jaruzelski was the political mainstream in that country, great uncertainties remain concerning the appropriate role of military officers in political matters. The advent of pre-revolutionary Solidarity members to governmental leadership positions has, in some respects, left the military on the political sidelines as the inheritor of a legacy of distrust and resentment from its execution of anti-Solidarity policies in the 1980s. Indeed, political decision-making in Poland is understood to be a three-way matter---the president, the government, and parliament---a constellation that minimizes direct military input.

[70]This section depends heavily on extensive interviews conducted with military officers and senior defense and foreign ministry officials in Hungary in November 1989; in Hungary, Czechoslovakia, Romania, and Poland in June 1991; and with Polish and Czechoslovak officials in the United States in summer and fall of 1991.

The changing relationships of military officers to the church further complicates the adjustment process in Poland. Before the revolution some 95 percent of Polish officers were party members and thus effectively precluded (although not, strictly speaking, by regulation) from the open practice of Catholicism. Soldiers were allowed to attend services, but no church facilities were maintained on military installations. All of this has changed. Chapels and chaplains now carry out religious activities on military installations, although the professional officer corps seems likely to remain more secular in orientation as the actual level of religiosity appears to have been relatively low in this group before the revolution.

Uncertainties about past Communist Party ties and present loyalties of military members are also pervasive. While almost all officers were party members before the revolution, only some were seen as truly "red." Party membership had become for many as ritualized as putting on a military uniform. In that sense, party membership for most officers was a "ceremonial" rather than substantive matter. Those who were party members for instrumental reasons (rather than deep conviction) have had the easiest transition to the new order. Some with deeper commitments are said to have left in "shock" or because they saw the handwriting on the wall. The officer making these comments acknowledged, at least, the honesty of these individuals. He was less laudatory about an undetermined number of "two-faced" officers who were deeply committed before, but have since adapted silently. He wondered where they really stand now.

There is similar distrust outside of the military, not surprisingly, among those who had been active in Solidarity. Of course, as has become increasingly evident in the factionalization that has occurred since the revolution, Solidarity was by no means a unitary group even before the revolution. Nevertheless, some in Solidarity would have abolished the military altogether. Although this is more of a "fringe" or extreme view, it is certainly true that there are few bases of support for the military among civilian elites. With a relatively few exceptions, civilian and military elites have tended to remain apart in their separate, distinct worlds even though the military, given the centrality of its organizational concerns in a period of drastic reductions in both budget and existing forces, has been trying to adapt to its new, less favorable circumstances.

Nor are the military and military life highly valued in Czech, Slovak, and Hungarian societies. On the other hand, because the military was not the obstacle to change in these countries that it was in Poland, integrating the armed forces has been somewhat less problematic. Church influence in these countries (as in the military segment of society) remains relatively low, particularly when compared to Poland, although cathedrals (as national symbols) are under repair.

Soon after the Czechoslovak revolution, Britain, Sweden, and Germany actively promoted their alternative models of democratic civil-military relations. Although to a lesser degree than in Poland, distrust by civilian elites of the military was one of the legacies of the Communist period in what would become separate Czech and Slovak republics. The fact that a civilian rector, a mathematics professor, was appointed to the Air Academy at Kosice is indicative of the regime's attempt to gain control of the military curriculum and transform the military into an institution compatible with, and supportive of, the new democratic political system.

Czech-Slovak (and even Bohemian-Moravian) separatism were openly addressed within military circles. Notwithstanding perceptions of inequitable treatment across the national groups, most agreed that the military had been fairly successful as an integrating institution. Breakup of the country into different Czech and Slovak states has had

disruptive effects on careers and personal lives in the military as in other sectors, adding to the turmoil with which separate military institutions now must cope.

Similarly, as in Poland and the Czech and Slovak Republics, redeployment of Hungarian units adds to the turmoil affecting military members and their families. Under the Warsaw Pact these forces were concentrated in the western part of the country. Complicating restationing efforts in a period of budgetary stringency and downsizing is a need for new barracks, family housing, and schools in the new northern, eastern, and southern locations. In short, the adjustments to a turbulent world continues unabated insofar as the personnel of East-Central European militaries is concerned.

These countries have also been struggling to adjust their strategic doctrines to the changing external condictions. The result has been a distinct tendency to take primarily a national view of security. As noted below, they do look to the United States and to multilateral institutions for a stabilizing contribution to security in the pan-European region and to their national positions in particular; but antagonisms within, between, and across these countries nevertheless dominate their security agendas. Lost territories, the fate of minority national and ethnic groups, and threats from nearby countries are the principal concerns. The idea that the security of any given state can be tied to a regional or global notion of security is discussed, but it is often secondary to realities closer to home.

Thus there has been a shift in military doctrine to territorial defense, albeit this concept has a decidedly different meaning in East-Central Europe than it does in countries like Finland, Sweden, or Switzerland where offensive capabilities are minimized. Territorial defense to military planners in Poland, Czechoslovakia, Hungary, and Romania in practice has meant taking defensive measures first and at the same time preparing for a counter-offensive.

In spite of radically altered circumstances (or, perhaps, because of them) military planners have tended to hold on to well established force-employment language even as they have fashioned what was intended to be new doctrine. Indeed, an offensive and counter-offensive doctrinal orientation survived the organizational demise of the Warsaw Pact relatively unscathed. Mind sets are often slow to change, especially in a turbulent period, since customary or established modes of thought no doubt bring some comfort to those trying to cope with great uncertainties.

It would be extraordinarily difficult to defend Poland against a great-power attack. Indeed, Polish planners agree that they could not deter such an event in any absolute sense; they could only hope to dissuade or discourage such an attack by having the capability to mount a defense designed to be as costly as possible to any would-be adversary. The hope, in part, is that such an adversary would calculate (based on a net assessment of costs and benefits) that invading Poland would not be in its interest. Beyond this, Poland's security is to be provided through external associations and international organizations that contribute to stability in the region. As a small state, Poland sees NATO and the CSCE, for example, as multilateral institutions that can add to its national security.

A continuing U.S.-in-NATO presence is reassuring, given Polish feeling of vulnerability in relation to both Germany and the former Soviet Union. The Poles (and other Central European states) have sought closer association with the alliance through the NACC--the North Atlantic Coordinating Council. Having a separate military doctrine from that prescribed by the USSR in the Warsaw Pact has been a major departure. After all, the Warsaw Pact was an alliance that legitimated, structured, and stabilized military roles, missions and associated capabilities.

Previously western- and offense-oriented doctrine has become country-wide in scope and somewhat more defensively oriented, but counter-attack capabilities for use when defenses fail are still part of Polish military doctrine. Broadly speaking, security is to be achieved in two ways. One is that of creating a more non-threatening environment through effective confidence-building and the other is providing, at the strategic level, for defense of the entire country from any threats emanating primarily from the east or west.

In its conceptual or formative stage and always subject to revision, the doctrine has included five general approaches. First, in the event of attack there are to be mobile operations on Polish territory. If these fail, there is to be irregular activity or armed resistance in occupied areas. Second, to resist aggression effectively, an air-land counterattack is to be launched against the enemy, not just in Poland, but also on the enemy's home territory with the aim of eliminating the threat and ending the aggression. A third element is resort to special operations as would occur in a contingency involving troops of the former Soviet Union. A fourth element is that Polish forces in any given contingency are to be part of multinational efforts, whether in Europe or out-of-area. Thus a "grouping" system is preferred not just for the need to share costs, but also for the security to be drawn from such multinational associations or "groupings." Finally, the operational readiness of Polish forces is to vary in relation to the threat.

Offense has not been abandoned and has been seen as legitimately part of an effective defense. For example, air "defense" is aimed not only air-to-air (or ground-to-air), but also air-to-ground (against the operating bases of an adversary). Air superiority has remained the first objective with close-air support to ground forces identified as another important role. Thought has also been given to the use of reserves. One approach is to have two kinds of reserves, those who would augment operational units, as was existing practice, and those who would be part of territorial units in the home areas where reservists live.

In all of this there is a severe doctrine-force mismatch derived from a reluctance to take fully into account the more limited capabilities of smaller forces operating without the coordinated support of alliance partners. There is realization that Poland could not expect to defeat a great power committed to invading (as one officer, referring not just to the country's flatness, but also to its geopolitical position between two great powers, stated: "We are a table!"). To the makers of doctrine, Polish military forces are to resist as best they can, buying time to allow for the international community to respond in the country's defense. Having a defensive capability (that included an offense) is also seen as discouraging or dissuading a would-be invader from attacking in the first place. In any event, national defense is understood to be part of a broader, multi-national security structure for building confidence and providing for security over the longer run.

Military doctrine in Poland appears to be developing in an evolutionary fashion, a study in incrementalism rather than radical departure from established modes of thought. By no means are the Poles moving to a Swedish total-defense model that constrains force-projection capabilities. "Defensive" doctrine has continued to retain the option of counter-attack. A civilian, parliamentary view critical of the "new" doctrinal approach is that such a doctrine is intended merely to sustain the military as a bureaucracy, providing the rationale for large, expensive forces now that Polish forces no longer can rely for their budgetary rationale on tasks assigned within the Warsaw Pact. The new doctrine is, in effect, a modified "para bellum" approach with forces not intended to be threatening to other states. There are, of course, those of the old school--not part of the new "defensive" doctrinal persuasion and thus not troubled by the offensive character of counter-attack forces; however, those still holding to old doctrinal premises are said largely to remain silent and not participate in these debates, whatever their private thoughts on such matters.

Air defense (to include air-to-ground, as noted above) will receive greater emphasis in the new doctrine. There is great interest in advanced military technologies to support this effort, although funding such purchases is a real problem. Division between military and civilian leaders on the level of funding allocated to the defense sector remains much more severe than intellectual differences on doctrinal matters as such. CFE provides a ceiling on armed forces in the region, but also adds legitimacy for civilian governments to cut military establishments.

Military doctrine in the former Czechoslovakia was also in a state of flux, although general guidelines were published by the Parliament. Defense of the entire country (with restationing over a two-year period of some 38 percent of the forces to Slovakia) and "reasonable sufficiency" were to be general principles to guide defense reorganization. Mobilization of the economy in a crisis was part of the plan; however, the degree to which there would be reliance on mobilization of reserves was not entirely clear. As before, the air force would continue its air defense and support to ground forces roles.

Earlier plans to convert the entire arms-export industry (rifles, pistols, tanks, small transport and trainer aircraft, etc.) to civilian purposes were more easily stated than accomplished. Decisions to close factories worsened an already difficult labor unemployment problem, particularly in Slovakia. Even so, doubts about the future competitiveness of the arms industry on world markets added to uncertainties, notwithstanding receptivity to the argument that small, nonaligned countries need at least some domestic arms production capability---an argument also made by advocates in other nonaligned or neutral countries. For example, Switzerland and Sweden also have had to deal with questions of maintaining technology (in practice, importing much of it and assembling weapons systems domestically) and achieving economies of scale to remain competitive internationally. Interest in foreign technologies was underscored in a brief interview in Prague with an American from a U.S. communications technology firm; at his table were two contract lawyers and a third representative of the defense ministry.

None of those interviewed disputed the view that a small state cannot expect to deter in an absolute sense an invasion by great powers; however, there was acceptance of the view that a small state can mount defenses that impose costs to a would-be invader that dissuade (or discourage) serious consideration of invasion. Czech and Slovak military planners understand the difficulties associated with defense of so wide an expanse of territory (much of it flat or hilly in Bohemia and Moravia in western and central areas, although mountainous territory to the east in Slovakia, by contrast, does provide greater opportunities for a more effective defense). Of course, the division into separate Czech and Slovak republics has further complicated attempts to achieve doctrinal agreement in separate Czech and Slovak military establishments.

In Romania, Perhaps because of the less-than-complete (primarily anti-Ceausescu) revolution, established institutions such as the military were less affected by the events of 1989 and 1990. Post-revolutionary formulation of Romanian military doctrine envisioned fewer changes than otherwise might have been the case. Unlike counterpart institutions in Poland, Hungary, and the Czech and Slovak republics, the Romanian military appears to have grown in size between 1990 and 1992. Consistent with the past, Romanian armed forces are understood to be a factor for stability, mainly externally but also domestically. And there doctrine, as such, begins by stating that the broad aim is defense of the territorial integrity, interdependence, and sovereignty of the country--changing only the direction of defense from its Cold War, westward orientation. Indeed, post-revolutionary Romanian military doctrine envisions an "all-directions" territorial defense. Efforts will continue to be made to have good relations with all states so as to avoid invasion in the first place. Because talk is never enough to assure security, however, military forces will

continue to be necessary, sized in accordance with the principle of "sufficiency" for dealing with invasions.

Force reductions under CFE in the Romanian view apply mainly to older, outdated equipment---another indicator that movement from well-established roles from the Warsaw Pact years will be modified only incrementally, even though their missions have changed in orientation to support a territorial defense. The Romanians are well aware that their post-revolutionary military thinking has been affected by former Warsaw Pact doctrine and perspectives. Old tactics and approaches (e.g., use of heavy armor, artillery, and air-to-ground capabilities) are to be adapted to the new circumstances.

It is technology (and Romanian recognition of its relevance), even more than the revolution of 1989-90, that is the principal inducement to doctrinal reassessment by military planners. Influenced directly by their observation of the Gulf War, they see any future war as a "war of technologies"; consequently, there is in their view a need for technical training and education, both theory and practice, and a need for the right kind of equipment.

The Romanians concur that a small state cannot deter absolutely, but by raising the cost to a would-be invader, it can dissuade or discourage such an invasion and thus "prevent" it. Reflecting on the "Clausewitzian view of the importance of people," one Romanian general offered the notion that "sometimes a small branch can overturn a large cart" (an indirect reference to Romania's problem of defending against the USSR or Russia and the successor republics). After all, Romania never had had to become a province in the Ottoman empire because, in their view, of strength deriving from its population. One can raise an entire people to resist; a small qualitative force would thus be joined by the people as a whole in time of crisis. There is, in short, considerable emphasis in Romanian doctrine on popular support. Reserve forces mobilized in time of crisis would be of two kinds--those operating in their home areas (territorial units) and those who would join the regular forces in operational units.

In contrast to the comparatively marginal adjustments in Romanian doctrine and force posture, the Hungarian experience has been quite different with substantial drawdowns in forces and, consequently, a clear sense that force-employment doctrine also would have to change. With the withdrawal of former Soviet forces complete, no foreign troops on Hungarian soil is to be a central part of the country's new defense policy. Hungary seeks a balanced set of relations with Russia and Ukraine as with other countries. Thus there is now an "all-direction" defense objective. Indicative of the overall turmoil, however, the political leadership did not give clear guidance as to the "enemies" (and the priorities among them) for which Hungary should plan. General military principles were worked out by November 1990; however, the Ministry of Foreign Affairs still had the task of coming up with the overall security rationale in coordination with Defense Ministry officials.

All-direction defense is understood as requiring greater mobility of forces than now exists---a costly project. The plan is to create three or four military districts, each with ready forces (regular units) able to move throughout the country. Training centers are essential as are small staffs able to accept mobilized reserve members for local, territorial defense. In addition, civil defense is a separate Ministry of Defense function. As in the other countries, the established routines of the defense decision-making process were disrupted with the demise of the Party-State mechanism that previously had determined the military budget. Parliament became the new locus of political authority with Defense and other ministries trying to find their way in the new political milieu. The military had always had relatively low acceptance in Hungarian society, a factor that complicated efforts to establish its new position and partly accounts for the slowness of parliamentary authorities

in Hungary (as in Poland and the Czech and Slovak Republics) to endorse new military doctrines. Developing formal doctrine in coordination with the parliament is a way of developing a parliamentary-defense ministry consensus, which clearly had been elusive.

From a defense ministry planning perspective, constraints on equipment and personnel preclude Hungary as a practical matter from developing an offensive capability. When funding allows, Hungary will need military forces capable of defending the country's territory. The relatively flat terrain (plains) of most of Hungary makes it vulnerable to an air and ground offensive. Defense must take place within Hungary's borders, but an aggressor in principle could be attacked across the frontier. As a practical matter, however, Hungary is not capable of doing this in any event.

A military professor at Hungary's national military academy commented on the lack of civilian expertise in the defense field, seen as a particular problem now that civilian government has assumed an important role in defense matters. Previously, military tasks were "assigned" from Moscow and, as a result, civilian government expertise in Hungary was not developed. He indicated his frustration with parliamentarians who, in his view, do not understand military questions.

This military professor also stressed that Hungarian military thinking is still affected by the legacy of Soviet military thought. After all, Hungarian officers were trained for forty years by the USSR. How can Hungarian officers be expected to change their views on military doctrine overnight? As a result, there is a tendency to apply the concept of defense against a NATO attack followed by a counter-offensive to the new circumstances—not against NATO, but against any adversary. In short, as in Poland, the Hungarian concept of defense still includes the Warsaw Pact notion of a counter-offensive. He recalled that the scenario of Warsaw Pact games always began with NATO attack followed by a large-scale Pact counter-offensive. Although the new Hungarian doctrine is defensive, a counter-offensive would be launched after initial defensive action. Hungary's aim, however, is not to provoke neighboring states. A counter-offensive would be confined to Hungarian territory. Without parliamentary approval, no Hungarian forces would be allowed to leave Hungarian territory.

Another perspective was offered by a university professor in Budapest. A political scientist, he noted competition among "different constellations" caught up in party politics on what should be the proper military doctrine for Hungary. He confirmed incrementalism--a gradual, step-by-step shift from Warsaw Pact doctrine--rather than any sudden departure from this mode of thinking about military force.

The professor spoke of deep manpower reductions underway. He mentioned that the idea of an all-professional army was being discussed; however, such a force likely would be too costly. The idea of a smaller but highly modernized, professional force has been "tabled" for budgetary reasons. Another problem is the lack of adequate transportation to support a mobile force; logistics to support an effective mobile defense structure are lacking. The professor added that air defense is the most expensive aspect of the whole issue. Hungary's small size makes the problem difficult. Moreover, there is sensitivity in Hungary lest even its air defense efforts be seen as provocative by Romania or other countries. In this regard, the "open skies" initiative between Hungary and Romania was seen as a positive development. Hungary's present shortcomings in air defense have to be understood in relation to the fact that, even in the Warsaw Pact, Hungary's air defense role was small and relatively insignificant.

Indeed, air force limitations were underscored by others. The Gulf war was said to demonstrate Hungarian vulnerabilities, given Iraq's experience and the fact that Hungary

presently relies on MIG-21s and MIG-23s, Russian technologies, and a similar navigation infrastructure. One general lamented that "Hungarian air defense is exposed in every way." He also recognized the high cost of air force and air defense programs as having the greatest budgetary impact, a severe limiting factor.

Constraints on equipment and personnel preclude Hungary from having an offensive capability. One military planner observed that Hungarian forces were not capable of attacking other states, but added that before Hungary redeploys forces from their concentration in the west, it will need to proceed carefully lest redeployments be provocative of others. Nonetheless, the armed forces are seen to have the task of demonstrating to a would-be invader that the costs of invading would clearly outweigh any gains to be had from invading. Defense capabilities that blocked or slowed an invader's progress would buy time for getting assistance from the international community. Hungary will opt for modest rather than fully robust defenses. Although battle tanks do have a counter-offensive role, Hungary does not have aircraft in its inventory capable of striking the enemy's rear or engaging in related missions of an offensive, air-to-ground character.

With respect to external models of defense, those interviewed in Hungary identify the Finnish case for emulation in its military aspects only---not its Cold War dimension of political accommodation of Soviet foreign policy preferences. Similar topography and contiguity with the the former USSR are common features that make for similar geopolitical circumstances even after the breakup of the Soviet Union. The Swiss case, by contrast, is decidedly different and thus is not considered suitable as a model for Hungary to use in developing its own force posture and military doctrine.

Although nonaligned in the post-Cold War period, national strategies and military doctrines of all the countries surveyed here included the idea of security to be gained through multilateral associations in Europe within the CSCE and with the EC and NATO (through its NACC), complemented by subregional ties as in the "Visegrad group" (Poland, Czechoslovakia, and Hungary) and the earlier "Pentagonale" of countries with territories that had been part of the Austro-Hungarian empire (Austria, Hungary, Czechoslovakia, northeast Italy, and the former Yugoslavia--primarily Slovenia and Croatia). The emergence of the latter even before the end of the Cold War was striking because of the conscious attempt to formalize in the present turbulent era the pre-1918 associations that transcended East-West, Cold War barriers still in place.

"Visegrad-group" talks at the presidential level began in late 1990 in a Hungarian castle by Czechoslovakia, Poland, and Hungary to explore cooperation across a wide range of programs, not just military. The meeting place was said to be significant historically in that it was the venue some 500 years ago for a meeting of the Bohemian, Polish, and Hungarian kings. Yet, cooperation in the Visegrad group has amounted to separate sets of bilaterals that include such cooperative ventures by military establishments as military-academic and training exchanges. As in the earlier Pentagonale, historical reference points are used to ground or justify political arrangements preferred by policymakers for other, present-day reasons.

Officials in the region continue to press for guarantees from multilateral organizations such as NATO that are at once both explicit and specific. As a practical diplomatic fall-back position, tacit assurances--if not formal guarantees--from multilateral associations are seen as better than no assurances at all. The possibility of a regional confederation has been discussed; however, there has not been much enthusiasm for such schemes. The vision is at most one of very loose subregional associations. There is much greater confidence in the security small states can derive from NATO or the CSCE as a

pan-European association inasmuch as both organizations including the United States as part of the security order in Europe.

Earlier Soviet-proposed "friendship" treaties were not met with much enthusiasm, particularly since they included a degree of intrusion that was not acceptable to these small states. Significantly, only Romania signed a "friendship" treaty with the former Soviet Union. Officials in Romania were somewhat defensive about the treaty, noting that it is a "necessary evil" that was at least better than the 1973 treaty in that the new agreement was said to establish a "truly equal partnership." Although overtaken by the withdrawal of troops and the demise of the Soviet Union, the self-defensive reason offered by officials to explain why Romania was the first former Warsaw Pact country to sign such a treaty was that Romania was the only one of these countries at the time "not to have Soviet troops on its soil." Not since 1956 had there been Soviet troops stationed on Romanian soil. By contrast, the other countries were portrayed as not being able to negotiate freely until Soviet forces were withdrawn.

Finally, in varying degrees national strategies and military doctrines posit progress in arms control as having the capacity to contribute substantially to security by removing the possibility of surprise attack. One official noted the CFE logic that the armed forces of any state not grow to provoke other states. Moreover, following this logic, no country is able to defend itself alone, but only as part of a larger system or in "groupings" of states. Confidence- and security-building measures---observations and notifications of exercises, exchanges, open skies agreements, and other efforts of a mutually cooperative kind---are valued for their direct and indirect contribution to regional security. It is noteworthy that one official insightfully saw security in social development—i.e., a growth in tolerance and acceptance of ethnic and national diversity. He expressed the view that European borders must be taken for granted as they are; they must become "spiritualized" in the sense that individuals may make progress wherever they happen to live. Yet, however progressive, this is not a commonly accepted view either within or between populations of the small states in this volatile region.

TURBULENCE AND THE MILITARY IN OTHER COUNTRIES AND REGIONS

We turn now to a comparison of military institutions at varying policy distances from the countries already discussed. Our focus is on the same two dimensions, sketching the impact of turbulent conditions on both military personnel and on national strategies and force-employment doctrines. To keep within the bounds of this modest effort, we have confined our review to only a few carefully selected, representative countries. A more comprehensive study would include more cases across regions and levels of development---examining them in greater detail with indicators of greater precision than is possible here.

The continually increasing role technology can be expected to play in the structuring of military forces is described by David Greenwood as "a set of interlocking vicious circles."[71] Reduced manning levels means ever more reliance on technology:

> Technological innovation is sought so that existing missions can continue to be performed effectively. Each generation of weapons systems must therefore be more complex than the last. As a result, both initial acquisition and overall life-time costs per unit go higher. To accommodate this, quantities are reduced, limiting the scope for learning and scale

---

> economies. . . . And the prospect of fewer units serves as an inducement to make each one do more---that is, to require multi-role or general purpose capabilities---which entails building systems of even greater complexity and expense. Budgets are, therefore, increasingly taken up with fewer and fewer costly, but complicated items.

This increased dependency on complex weaponry, of course, requires personnel trained at ever higher technical levels of expertise. Old patterns of seemingly unquestioned, hierarchic authority inevitably are challenged since the effective use of advanced technologies frequently requires considerable discretionary authority at ranks well below traditional command levels. As Greenwood observes: "Management styles in the services have become less rigid and hierarchical, the blurring of officers and men distinctions being particularly noticeable in functions with a high technological content."

Likewise, Yost underscores this difference in French military authority patterns and associations between what can be referred to as the *armee des techniciens*--"those dedicated to technology"--and the *armee traditionelle*.[72] The latest chapter in the ascendancy of the former over the latter is the "technological revolution" that has taken place in the information field. Yost observes that in addition to "the need for more professional forces with greater mobility, including long-range logistical support" is "the even more imperative need for improved intelligence, communications, and information systems."

Joseph Rallo notes a similar impact of technology on personnel relationships within the Italian military.[73] Given increasing reliance on technology that reduces differentiation in gender roles, women are now admitted to both enlisted and officer career ranks in the Italian armed forces. Conscripts, given their relatively lower skill levels compared to professionals, are in danger of being seen merely as "water-carriers" for the professionals.

In addition to this long-term trend toward increasing dependency on sophisticated technologies, the problems of the Italian military have been compounded by what Rallo describes as the "domestic political upheaval" in Italy that is "perhaps unmatched by any modern western government." Beyond "the conflict inherent in the traditional North-South split," traditional patron-client social structure and associated politics, particularly in the south, would seem to have become less and less compatible with the exigencies of an increasingly advanced technological society.

As discussed in earlier sections, rapid and deep force downsizing is an indicator of how military establishments have been affected by the turbulent changes since the end of the Cold War. The countries least affected by the changes tend not to experience force downsizing to the same extent, whether this is due to greater "policy distances" or to greater abilities to insulate themselves from external influences. Table 5 presents the reductions in military forces of those countries most directly impacted by the reduced-risk environment that followed the end of the Cold War. Here it can be seen that force-sizing in India, Indonesia, and Japan were least affected. If anything, the end of the Cold War may have increased uncertainties faced by India and Japan, although not to the degree that major force-size increases were deemed necessary.

Personnel reductions are not new for the British armed forces, which for some four decades have been steadily in retreat from global power pretensions. Nevertheless, great upset has been caused by disbanding even historically celebrated units. Significant challenges have been raised, as Greenwood reports, on "the scale of Army cutbacks, especially as they affect the infantry," coupled with skepticism about the relevance of "needlessly extravagant" programs such as advanced fighter aircraft and nuclear submarine programs "in the new strategic circumstances."

The Indian case is perhaps representative of many Third World countries in that post-Cold War circumstances have added to societal upheaval with the expansion of existing problems to include national and ethnic strife.[74] Auhtority crises in these countries are not new, but they have been given an additional boost. Jerrold Elkin notes "the greater reliance on the military for restoration of public order" and observes that "frequent use of the army to quell internal strife carries the germs of politicizing the army," especially since "army operations at times have alienated minority communities."

Table 5: Changes in Military Personnel on Active Duty in Selected Countries

	1989	1992	% Change
Germany			
West	494,300		
East	173,100		
Unified		447,000	- 9.6
France	466,300	431,700	- 7.4
United Kingdom	311,650	293,500	- 5.8
Italy	390,000	354,000	- 9.2
Japan	247,000	246,000	- 0.4
India	1,260,000	1,265,000	+ 0.3
Indonesia	285,000	283,000	- 0.7

The challenge to authority posed by national-ethnic "factionalism in the military" was exhibited in a "1984 mutiny by Sikh personnel." Elkin concludes that military challenges to civil authority may be "an unintended consequence of the military's efforts at suppressing violence," given that such involvement in countering "secessionism, communalism, and terrorism" may lead to "weakened constraints on the officer corps regarding involvement in politics."

Not unlike India and many Third-World countries in this respect, national and ethnic conflicts also have beset Indonesian society throughout the Cold War with observable impact on civil-military authority relations. Phil Williams observes how army officers have been involved in these matters, leading as well to their idirect and indirect interventions in the political realm.[75] The armed forces have indeed acted as "a central part of government" with a primary focus on domestic matters.

Japanese military personnel persisted throughout the Cold War in a society that, given the World War II experience, ranged in orientation toward the military institution from one of indifference to one of hostility. More favorable attitudes have been promoted, as John Endicott notes,[76] after "40 years of disaster relief, civil assistance" and other "good works." At the same time, however, post-Cold War involvement by Japanese military members in overseas activities (as in UN peacekeeping) exposes them to criticism by large sectors of society that oppose any such military activity.

Similarly, as Catherine Kelleher remarks, there is "deep-seated aversion many Germans have to the idea of greater military responsibilities" outside of their borders.[77] Participation in the Gulf War, in "Blue Helmet" peacekeeping contingencies, or other UN actions are controversial activities for German soldiers as they are for their Japanese counterparts. The end of the Cold War has challenged stock answers developed and maintained over all the years since 1945--that Japanese and German militaries would be constrained to their home territories.

As indicated in Table 5, Germany and France have significantly downsized their forces . Adjustment to these new circumstances has been relatively less severe in France, although the French have experienced the personnel disruption that comes from reducing forces thus far by more than 7 percent over two to three years. The German experience has been more traumatic and disorienting with a dismantling of the NVA (East German People's Army), absorbing some of these Germans into a downsizing Bundeswehr, and returning the rest to civilian life. Kelleher remarks how "the divide between 'Ossies' and 'Wessies' dominates military as well as civilian life." She mentions the "added special symbolic and psychological burdens" borne by former NVA members as they adjust personally "to membership now in NATO forces after decades of enmity." Professional acceptance of East Germans has also been problematic for many westerners in the Bundeswehr. Adding to adjustment difficulties for easterners is the expectation that they will accept the West German democratic concept of Innere Fuehrung--the inner-direction of soldiers that puts their status as citizens first.

As for changing strategic doctrines in these diverse countries, Greenwood notes that although "cutting the armed forces down to size" became a priority, the UK's retention of capabilities to perform multiple missions across the services "demonstrated that it still wished to be regarded as in the front rank of European powers," albeit "as no more than a medium power in a regional setting." He describes the British military institution after the Cold War as being in "a protracted period of adjustment."

The British have been marginally more successful than the Italians in developing a commitment to a new strategic concept in NATO of mobile, rapid-reaction, tactical-air and ground forces. Rallo notes Italy's pledge of units to NATO's rapid-reaction forces and the country's adoption of an "active prevention" model of national defense that in addition to "protection of national interests" contains vague commitments to "crisis control" and "peace management and protection." Compounding Italian difficulties in reaching consensus on a post-Cold War strategic doctrine have been evolutionary changes in NATO thinking coupled with political disarray within Italy itself. Moreover, intense rivalries for resources to support particular roles and missions are apparent in Italian defense circles, with the

army losing out to the technologically intensive air and naval arms. Fashioning a coherent defense doctrine in a period of global change and domestic turmoil has been extraordinarily difficult, predictably producing incremental shifts rather than a comprehensive response to post-Cold War developments.

As in Italy, recurrent scandal and political turmoil define the domestic political context within which Japan's military establishment must function. This is in addition to uncertain policy implications for the Far East of the change from a Soviet Union to the new Russian Federation. Turmoil in China and in Korea, not to mention Japan's dependence for its security upon the United States and its concern over future American security guarantees, are further complicating factors. As Endicott concludes, Japan "must ultimately depend on the United States to repel any large-scale and determined invasion."

Nevertheless, any formal strategic or doctrinal shift from "defensive defense" or "defensive missions in and about the home islands" (not to mention advocacy of overseas power projection capabilities) is highly controversial and thus far has been avoided. The absence of significant changes in doctrine does not mean, however, that the foundation of support for present doctrine is as firm as it often seems. Old quandaries have assumed new prominence in the post-Cold War world. Still unresolved, for example, is the dialectic between an "internationalist world view" and what Endicott calls Japan's "self-reliant view" (that is, "introspective" and favoring "autonomous development")---a perspective sometimes accompanied by a dose of anti-military feeling. Without resolution of this fundamental question, of course, it is difficult to make (or carry out) decisions that would involve Japanese military forces in peacekeeping or other external activities even when conducted under UN auspices.

Moreover, the broader view, particularly in the post-Cold War period, is that true security rests not so much with military matters, but with maintaining "the viability of the free trading system, including access to raw materials." In this decidedly internationalist world view, advocates see "the entire industrial base and current economic wealth" as being "based on unhampered access to the global market." Thus, even in the "internationalist" camp, there remains disagreement on the purpose or relative importance of the Japanese military role.

In one of the clearest statements of increased turbulence produced by the end of the Cold War, Greenwood observes how after the fall of the Berlin wall in 1989 the established "framework of assumptions around which British defense policy had been built for more than a generation began to fall apart also." With smaller standing forces the emphasis has shifted (as elsewhere) to "immediate and rapid-reaction capabilities." How these forces are to be integrated with other national forces under NATO or under EC, WEU, or other auspices is not clear. Nor is there consensus on the types of contingencies to which Britain would wish to commit its forces.

The breakup of the USSR has added complexity to the Indian strategic view, given India's concerns with a "nuclear-armed China and Pakistan." Elkin observes how the "disintegration of the Soviet Union" has put Indian security policy in disarray in that India previously had "counterbalanced Chinese and American support to Pakistan" with carefully crafted "security linkages" to the USSR. In this unsettled period it seems doubtful, Elkin asserts, that India has yet developed a nuclear doctrine to counter such threats to its security even though "a conventional war between India and Pakistan readily could escalate into a nuclear exchange." Even on the more basic matter of assuring a supply of conventional armaments, India faces significant uncertainties. Although surpluses of older equipment are available in world markets, India will have to cope with "protracted disruption of arms shipments" from the former Soviet Union, given "lowered production

rates" as well as a "transition of some military-related industries to the manufacture of civilian goods."

Being a Third-World country at considerable policy distance from the center of post-Cold War developments, Indonesia and its military have experienced the changing structures of world politics to a lesser degree than many other countries. Yet, whatever the degree of impact, Williams tells us that "Indonesia is increasingly having to focus on external threats." This is due to the prospect that "American power in Southeast Asia will be reduced and perhaps even withdrawn altogether" along with "concerns over the increasing power projection capabilities of China, India, and Japan."

By contrast to the relatively modest changes in Indian, Indonesian, and Japanese circumstances, France and Germany have been at the policy center of the increased turbulence in Europe. Yost notes that the French see "the collapse of Soviet communism" as "likely to result in a series of upheavals in the European global political order." Consistent with this turbulent world view, they see the end of the Cold War as having "transformed several of the political alignments, power relations, and threat assessments that defined French policy regarding security in Europe." In an extraordinarily clear expression of the confusion experienced by policy makers in response to these transformations, Yost records the French defense minister as saying that present-day "risks" are "innumerable, diverse, and geographically dispersed, and for this reason difficult to grasp and evaluate." As a result, defense thinking "must be adapted to crises of more and more varied forms." Yost comments that because of their "uncertain utility in countering emerging threats," nuclear weapons have been "devalued in the current security context."

France's status and roles in the post-Cold War period are also uncertain, notwithstanding efforts "to assure its [French] security and retain its preferred level of political status in the new circumstances." After all, much of its Cold War military importance (and its relatively independent position in relation to the United States and NATO) depended on its prowess as a nuclear power. French willingness to participate actively in multinational military activities, even under U.S. operational control, is yet another approach to maintaining its great-power stature that made it a permanent member of the UN Security Council in the first place.

Of even greater significance are, as Kelleher puts it, "the many unanswered questions in Germany regarding the nature of security in the post-Cold War world." Indicative of the effect of global changes on German strategy are "three competing conceptions of a united Germany's role in Europe and global affairs." Opposed to those who would normalize Germany's role as a great power, including the use of force outside of Germany and thus moving beyond the legacy of World War II, are those who see a new Germany as a "civilian" power not disposed to use force for national purposes. Germany in this view can be a "civilizing force" by way of its "moral example" of "support for international organizations and international law" and "an international 'peace corps'" committed to "economic reconstruction and ecological projects." Contending with these military and anti-military internationalist views is "a strongly inward-looking Germany that either chooses [not], or is unable, to assume greater responsibilities in Europe because of its preoccupation with domestic affairs."

In the face of these uncertainties, the German government, not surprisingly, "has persistently pursued a pragmatic policy of incremental adjustments." In the absence of a clear strategic design, the German position has been to be reactive and flexible in relation to "changing circumstances." Seeking "reassurance and stability" as essential elements of a new security order, Germans have focused on "transparency," "reciprocity," and other confidence- and security-building measures within the CSCE. They also have looked

toward "smaller, more flexible, lighter forces" that are consistent with post-Cold War strategic and doctrinal shifts within NATO. Still, all such matters remain in a high state of flux as the pace of change continues.

ARMED FORCE AND ARMED FORCES AS AGENTS OF CHANGE

If the foregoing analysis is essentially correct and the world is destined to be ensconced in a long, if not permanent, period of turbulence, it seems likely that both armed force and armed forces will undergo increasing diminution as agents of change. The lessened utility of armed force can be anticipated because the world has become too complex to be managed through the exercise of coercive power and the decreasing influence of armed forces can be expected because their command structures have been undermined by the skill revolution and the worldwide crisis in authority. Given the constraints imposed by dense populations, faltering economies, war-weary publics, weakened governments, divided societies, and transnationalized borders---to mention only some of the dynamics that sustain global turbulence---there are fewer and fewer degrees of freedom within which military power can operate as an independent variable that accounts for sizable proportions of the variance in public affairs. High-tech weapons can strike targets with pin-point accuracy, but neither they nor conventional forces can be very effective when directed toward segments of a bifurcated world marked by shifting loyalties, diverse ethnic groups, decentralized social structures, deep historic commitments, massive migrations, and interdependent economies. And if the personnel charged with exercising armed force are themselves in conflict, uncertain of their tasks, and aware of their limitations, the chances of effective applications of coercive force are further diminished.

The implications of this conclusion for military establishments are profound. They not only suggest that recourse to war across national boundaries is likely to be increasingly eschewed, but they also point to a counter-intuitive insight that negates a long-standing and widely-shared core premise about the role armed forces play within their own societies: the premise is that the military, having control over the means of violent coercion, are the one institution that can bring order out of chaos and establish societal stability where none existed before. This premise is often voiced by observers fearful that too much societal disorder will lead the military to seize governing power, and it is also a premise that high-ranking officers in many parts of the world have articulated in the hope that their expression of the idea will be experienced as a threat that stabilizes situations bordering on chaos. In some cases, of course, military coups d'etat have actually been undertaken on these grounds. As global turbulence mounts, however, the soundness of the premise becomes increasingly questionable. The skill revolution, authority crises, and bifurcated global structures---not to mention population explosions, dynamic technologies, and the globalization of national economies---have rendered societies too complex, resources too scarce, loyalties too diffuse, and military organizations too hesitant for the military-as-the-only-stable-institution scenario to retain its viability. As militaries in Algeria Argentina, Brazil, Burma, Chile, China, the Philippines, and elsewhere have discovered, and as those in Algeria, Haiti, and Serbia are presently finding, establishing and maintaining societal stability is no longer a simple matter even if military leaders are ready to resort to force and ruthlessly mow down their own people. For many of the reasons noted here, armed forces can no longer assume they have the competence to overcome the dynamics of internal turbulence and set their countries on a stable course; and, of course, the knowledge that this assumption is no longer tenable contributes to their hesitancy to act decisively, a predisposition which, in turn, further lessens their chances of success.

This conclusion lends itself readily to a particular situation presently preoccupying policy-makers. It suggests that the likelihood of a successful military coup in the former Soviet Union are virtually nil. It could not last long enough to bring order out of disorder

even if the military in any or all of the former republics were unified and used all the means at their disposal. The disarray and complexity in that part of the world, along with the potential for opprobrium and counter-measures from other parts of the world, are far too extensive for a military take-over to conform to the historic pattern. To be sure, some Russian officers are "so terrified of the loss of their power, privileges, perquisites and the collapse of everything they believed in and dedicated their lives to, that an effort to seize power cannot be precluded," but the probabilities are to the contrary, not only because "very few senior military leaders believe that they can solve the nation's social and economic problems," but also because it is estimated that "the majority fear that any effort to impose order on the country through martial law would be more likely to touch off what the world fears---large-scale civil war in a nation with 27,000 nuclear weapons."[78]

This counter-intuitive reasoning that ascribes a growing reluctance by military elites to initiate coups also applies to those situations where a military take-over is not so much a coup against society, but is rather an action that immediately evokes wide support from diverse segments of society. If, for example, persistent economic disarray leads to extensive public backing for the military to restore order and productivity, as appears to have been the case in Venezuela and as many anticipate will occur in one or more of the countries of the former Soviet bloc, that backing is not likely to last long as the intractability of the problems reveals that a military regime is no more able to resolve them than was its civilian predecessor. Furthermore, a widespread public readiness to welcome a military take-over can be misleading: "When soldiers have moved to intervene, people's dissatisfaction with the civilians in power has generally turned out to be not so great after all."[79]

To be sure, most military establishments continue to be more hierarchical than other societal institutions. Except for the current situations in the former Soviet Union and Yugoslavia, the world is not witnessing an open season for the flouting of rank and the breakdown of command structures. On the other hand, traces of undermined discipline and expanded analytic skills fostering redefined self-interests, cocooning, and subgroupism are manifest in many countries, and it is thus self-deceptive to dismiss the most conspicuous situations as mere exceptions, as expressive of unique circumstances that are unlikely to occur elsewhere. As our comparative analysis has indicated, the very same dynamics that brought the Soviet and Yugoslav militaries to their present state are at work on a global scale. The multi-ethnic foundations of these two situations have doubtless intensified the erosion of their conventional lines of authority, but even the most homogeneous military organization is faced with their hierarchies of rank being undermined by the technical expertise and the highly trained personnel required to apply them.

It seems crucial, therefore, to view the Soviet and Yugoslav situations not as exceptions, but as extremes on a continuum, as indicative of a potential to which all armed services are susceptible during a period when established loyalties and organizational practices are everywhere subject to parametric transformations. Soldiers and officers are not exclusively habit-driven; they too are susceptible to learning and change as their skills expand and their opportunities narrow. And the changes they experience are as likely as not to mirror the transformations at work elsewhere in the world. Military establishments and their personnel may be distinguishable by the uniforms they wear and the weapons they shoulder, but otherwise their distinctive missions, roles, and services seem bound to become increasingly blurred by the turbulence that is sweeping across world politics.

ABSTRACT

A case study of medication switched from prescription status to over-the-counter availability illustrates that policy making may occur without ever formally being part of the public policy agenda. More than 200 Rx (prescription) medications have been redefined as OTC (over-the-counter) drugs in the last 5 years. The definition of prescription medication status itself has been substantially modified with little public attention to the fact. Rx no longer signifies that a drug is inherently unsafe, potentially toxic or harmful except under supervision of a licensed practitioner. Increasingly it designates a preliminary trial status, necessary until experience accumulates and an estimate of benefit-to-risk established, at which point a drug can be switched to OTC.

A confluence of circumstances permitted policy to be adopted, a change implemented, in the absence of formal intention to do so, without executive consideration, legislative deliberation, or public debate. **First**, it was facilitated by an exceptionally receptive cultural and social context (an increase in individualism, a decline of faith in science and scientific expertise, an emphasis on deregulation, and a concern with cost-containment). **Second**, awareness that policy making is occurring requires effective interest aggregation. Here the policy issues did not generate enough attention to arouse and mobilize those concerned. One well-organized group with a considerable stake in the matter, pharmaceutical manufacturers, was very much in favor of the change. It is not surprising if the resulting policy was favorable to it. Theirs was the only voice heard because it was the only clear expression of a position and it argued that the change was in the public interest. **Third**, the impact of the policy on most other groups was mixed and this made it hard for them to mobilize either way. Some consumers benefited because they could obtain medication without paying for a doctor visit. But other consumers lost out because their Rx medication was not covered by insurance after it was switched to OTC. Some insurance companies saved by not having to pay for OTCs but misuse due to new liberalized access could lead to additional patient hospitalization and increase costs. **Fourth**, the group that had the most to lose because of the policy change, the American Medical Association, never mobilized to present the opposing view. Thus the case against the change from Rx to OTC was never effectively presented. **Finally**, the regulatory agency designated to monitor the public interest, the FDA, acquiesced to the pharmaceutical manufacturers requests for switching. Regulatory agency co-operation of this nature may be critical for policy making off-the-agenda.

RX TO OTC: PUBLIC POLICY MAKING OFF-THE-AGENDA[1]

It is commonly assumed that agenda setting is crucial to the policy process because if "an issue cannot be placed on the agenda," it cannot be considered and nothing will happen." If policy formulation is the "plan of action intended to rectify the problem" then getting it on the public agenda might seem like a necessary, if not sufficient condition for action (Peters, 1991: 41). In the mid-1960s there was some suggestion that issues were deliberately kept off the public agenda (non-issues) in order to avoid the need to take action on them and assure the status quo (Bachrach and Baratz, 1966). It is assumed that if an issue is to receive attention it needs to be on the policy agenda.

In this paper I examine a case study of policy making or policy change of substantial importance that took place without the matter in question ever being recognize as a problem worthy of being put on the public agenda. A new public policy concerning prescription medication has been established almost without any conscious intention to do so. *There has been a substantial modification of the implicit definition of prescription drug status* as a result of a series of smaller incremental changes in the status of specific drugs that were switched from Rx[2] status to OTC.[3] New policy and procedures were molded, *de facto*. The number of individuals affected was substantial and the new policy will have an impact on how illness and disease are diagnosed and treated. No resources were expended to draw attention to the issue. No "policy stream/community" made up of researchers, advocates, experts and other specialists ever came together to analyze this policy arena or set out explicit alternative policy proposals (Kingdon, 1984). No one attempted or formally sought to determine the financial and technical viability of the policy.[4] No Congressional

[1] Special thanks to Milton Roemer and Ruth Roemer for comments and encouragement. Paul Grussing of the Department of Pharmacy Administration at the University of Illinois - Chicago offered excellent suggestions. Pauline Norris of Christchurch, New Zealand, Hosein Salehi, of the Economics Dept. UCLA, made helpful suggestions. Dr. Kathleen Johnson contributed important research materials. Thanks to the following for having kindly accepted to be interviewed for this project: Dr. Paulus, American College of Rheumatology Liaison to the FDA Arthritis Advisory Committee; Dr. Bennett of the AMA, David Spangler of the NDMA, Dr. Craig Stern of CareAmerica Health Plan, Steven Litsey, Pharmacy Director at Kaiser, Los Angeles, and others who requested anonymity.

[2] They are also referred to as "ethical drugs" because historically they were not advertised (Duncan and Weber, 1979:3) or "legend drugs" because they carried a Rx legend.

[3] OTCs are also called "proprietary" or "patent" medicines.

[4] FDA Advisory Committee Members were consulted on the shifting of specific drugs but not on the *global policy* or on the re-definition of Rx status.

committees held hearings. No organizational input was apparent. No formal legislation was ever proposed or adopted. The initial stage of getting on the agenda, "issue recognition" involving official notice of a concern where government action would be appropriate, never occurred (Nelson, 1984). But policy was made just the same, without formal consideration on either the systematic or institutional agenda (Cobb and Elder, 1983).

Policy making that is not on any agenda shares more characteristics of "policies without publics" (May, 1991) than with other models in the policy literature. Nevertheless, it differs significantly from this model of policy design, as well, because there is no formal recognition that policy making is even intended.

For "polity without publics," there is a "lack of interested and organized publics" (May, 1991:198) and as we will see, this is true, to some extent, for the Rx to OTC switch movement as well. "Publics" exist in theory but interest aggregation is confused by the complexity of how issues impact on the various interest groups and in these cases it is difficult to act on an issue or advocate explicit demands. The whole switching issue had low visibility and the public remained largely unaware of any change until the switched drugs began to be advertised and when a drug's switched status began to be employed as an incentive for purchase.

Peter May notes that "for policies without publics, there is a potential for issue capture by a single public whose preferred policy definition or solution substitutes for broader debate over appropriate policy responses. . . " (1991: 198). This means that "there is more limited opportunity for policy learning" because the absence of competing publics prevents debate over the appropriate boundaries for public policy. The lack of debate among competing publics over "problem definition and preferred solutions creates uncertainty about social preferences and related criteria for determining what constitutes a good policy" (May, 1991:202).[5]

None of the agenda setting approaches presently known (pluralist, elitist or state-centric) considers policy making off-the-agenda (Peters, 1993:45-6) perhaps because it is so unusual. But even though it may be a residual category it is, nevertheless, worthy of attention because it challenges broadly accepted views of the policy process. It makes us ask what other policy action has taken place unnoticed because it was never formally registered on the public agenda? Finally, this case study suggests some hypotheses as to the conditions in which policy making off-the-agenda is produced.[6]

The recent trend toward switching medications previously available only with doctors prescriptions (Rx) to over-the-counter (OTC) status presents an opportunity to study successful policy making and policy change off-the-agenda. During the 1980s more

---

[5] Like "policies without publics" exposure to risk appears to be high (numerically) but the consequences of risk are judged to be low. This accounts for the low visibility of the issue area because there is "little incentive to redress relatively minor harms (May, 1991:195). In the case of the Rx to OTC switches risks may appear low but it may also be the case that the risks are simply very difficult to calculate or determine in advance or that they range very broadly within the category of switched medications.

[6] My method and approach are straightforward. This paper is based on open-ended, interviews with representatives of the various sectors affected by the switch movement. Analytical assessment of library materials and other published documents contributes to the analysis. My orientation is interdisciplinary and centered in the social and behavioral sciences.

than 200 drugs were switched from Rx to OTC (Segal, 1991:8).[7] The Nonprescription Drug Manufacturers Association (NDMA) estimates that more than 400 OTC products now use ingredients or dosages available only by prescription 15 years ago (NDMA, 1991). The medications that are being made available upon demand are not just those that "relieve symptoms of minor, self-limiting conditions." They include medications of substantial importance that "prevent diseases" and "manage chronic conditions" (Young, 1988: 6).[8] The impact of switching on the medication practices of citizens, doctor-patient relations is tremendous. Neither are the financial dimensions of the Rx to OTC switch trivial. Switched drugs have improved the profit margin of pharmaceutical manufacturers (Rosen, 1991). All but one of the 10 best-selling OTC drugs introduced since 1975 was a switched drug including Advil, Nuprin, Sudafed, and Benadryl (NDMA 12/91; Cope, 1991:7).

The Rx to OTC switches question common assumptions and the generally accepted justifications for keeping certain medications off the open market, for restricting their use to doctor-supervised situations. Sometimes called the switch movement, it has proceeded in a singularly incremental fashion. The liberalization of access to so many powerful mediations may even undermine the rationale for continuing to restrict other drugs to a prescription-only status. Few of those who actually brought this policy change about had any idea or vision as to where they were going and what they were doing (Paulus, 1990). For all practical purposes policy making off-the-agenda is still ongoing.

I. OTC AND RX: ORIGINS, DEFINITION, AND RE-DEFINITION

In this section the background and logical consequences of the Rx to OTC movement are examined. Why were certain drugs designated Rx-only to begin with? Why are the justifications previously offered for Rx restriction no longer adequate? It was the changing legal/regulatory requirements of OTCs that actually provided the initial thrust for switching.

OTC drugs existed long before anyone thought about regulating them.[9] "Prior to the 1938 Federal Food, Drug and Cosmetic Act (FD&C) any non-narcotic drug was available without prescription" (Temin, 1979A: 433; 1979B:91). Even then, the government's concern, until very recently, was limited to the **safety** of OTCs. Only in 1962, in the wake of the Thalidomide tragedy, (Bruch, 1989: 528; Meier, 1985:83), did Congress pass legislation, the Kefauver-Harris Amendments to the Federal Food, Drug and Cosmetic Act, requiring that all drugs, including OTCs that entered the market after 1938, be tested for efficacy as well.[10] The enormous task of assessing the effectiveness of the over 300,000 OTCs did not

---

[7] From 1976 to 1983 twenty-nine prescription ingredients moved from Rx to OTC (Hearings, 1983:4).

[8] Peter Temin of MIT concluded that even penicillin could pass the cost-benefit analysis test for switching and should be available OTC (1982: 21). He dismisses the possibility that "resistant strains" might develop, the argument that most authorities use to preclude OTC penicillin.

[9] See Berridge and Edwards (1981) for the fascinating story of self-medication with opiates in nineteenth century England. Such addictive drugs remained broadly and openly available throughout the U.S.A. until the first decade of the 20th century.

[10] Some contend that this OTC review was not required by statute but was rather undertaken voluntarily by the FDA (Fisher, 1987).

begin until 1972 (Farley, 1987-1988:12).[11] The FDA, assisted by the National Academy of Sciences and the National Research Council, delegated much of the work to a series of externally staffed, expert advisory committees (Bruch and Larson: 1989). The FDA, however, was free to accept or reject the recommendations forwarded by these advisory bodies.[12]

It was this process of verifying the safety and determining the efficacy of OTCs that initiated the Rx to OTC movement (Rachanow, 1984:201).[13] Manufacturers up until this point had "resolved most of the prescription/OTC appropriateness issues informally with the FDA on a drug-by-drug basis" (Fisher, 1987:3). Once the FDA's OTC review was underway drug manufacturers began to monitor the working progress of the advisory committees. In some cases manufacturers prematurely switched a drug from prescription to over-the-counter status on the basis of what they expected the advisory committee would recommend. The manufacturers thus assumed the FDA would adopt the course of action suggested by the outside advisory committee. In 1975 the FDA formalized the ongoing switching of Rx to OTC by establishing formal guidelines for initiating the process by way of a petition (from anyone, even an individual citizen), as a supplementary NDA (New Drug Application), or through the OTC review procedures itself (Fisher, 1987:3; Hearings, 1983:11).[14]

The existence of Rx drugs as a separate category of medication is a relatively recent phenomenon. Prior to the "enactment of the 1938 FD&C Act there was little distinction between OTC and Rx drugs".(Meier, 1985:81). In 1938, a year after more than 100 people died from the "Elixir Sulfanilamide," the FD&C Act was adopted requiring manufacturers prove a drug was safe before it was sold to the public. Up until this time 85% of all drugs were effectively OTC. Mention in the FD&C Act of the possibility of sale of drugs on a "prescriber" status if "toxicity" was a "problem" led to the establishment of Rx status by general administrative regulation (Temin, 1979B; 1980A: 1; 1980B: 303).

The actual legal status of prescription drugs remained a bit fuzzy until the 1951 Durham-Humphrey Amendments to the FD&C Act that required drugs unsafe for self-mediation be defined as "prescription drugs" and used only under a doctor's supervision (Temin, 1980A). The Durham-Humphrey Amendment officially recognized that drugs available in the post-World War II period were "vastly more potent and complex" than had been the case in previous times (Fischer, 1987).[15]

---

[11] Grouping these products by treatment category and ingredients facilitated the review.

[12] Seventy-five percent of OTC drugs lacked evidence of effectiveness according to Farley, 1987-1988:12 and Silverman and Lee, 1974: 230. Only in 1990 did the FDA officially and publicly conclude that 258 OTC ingredients were ineffective and should be banned. Over the years most of these substances were voluntarily removed from the market (FDA Consumer, September 1990: 24 #7: 5).

[13] See the appended list (prepared by the NDMA) of medications transferred by the FDA to OTC status as a result of the review of nonprescription drug products.

[14] Because the OTC review is now completed only the first two methods for switching remain available (Fred, 1990:14).

[15] Temin contends (1980A: 55) that it was not just new drug technology but a positive attitude toward government regulation, an acceptance of government intervention, a move away from the free market economy, and a belief that citizens needed to be protected, that inaugurated "prescription status."

The rationale for designating a medication as a prescription-only drug were fairly straight forward. "Seventeen habit-forming drugs and their chemical derivatives" were included. Other *drugs were designated Rx if they "were not safe for use except under the supervision of a practitioner licensed to administer them"* (Young, 1988:6). These drugs had benefits but were assumed to require a doctor's supervision for safe usage because they were "potentially harmful." The criteria for designating a drug "prescription-only," according to judicial interpretation of the Durham-Humphrey Act, involved the "toxicity or other potentiality for harmful effect" of the drug if employed without expert supervision (Kaplan, 1982:5). Rx status was also accorded if the drug involved the sudden onset of dangerous side effects (timing), or if it was thought to mask a serious underlying condition that required immediate attention (Fisher, 1987:2).

The switching of a medication from Rx to OTC represents a substantial revision of medical opinion about the character and qualities of the drug in question. From a strictly logical point of view it might initially appear that switching is an admission that a mistake had been made about the characteristics of a drug. Switching might seem to imply that a drug was not, in fact, as dangerous or so toxic or potentially harmful as originally thought and therefore the supervision of a physician was not required for prudent use. But given the large number of drugs switched in the last decades it is hardly imaginable that switch movement is merely a reflection of error.

The switch movement, rather, indicates that the original definition of Rx no longer stands and has been informally, but substantially, revised. Thus the criteria originally used to designate a drug Rx are no longer being applied to all medications that fall in this category. In some cases Rx has come to signify a preliminary trial status, necessary until experience accumulates. Today, many drugs are designated Rx status for the time needed to demonstrate that they are relatively safe for self-administration and have a favorable "benefit-to-risk ratio." While toxicity and potential harmful effects are still a consideration, potential benefits may outweigh these considerations. "A low margin of safety may be appropriate for particular OTC drugs (where the benefits to be obtained are high) . . ." (Rachanow, 1984:205). The reasons for a Rx assignment today are not always that a drug is inherently unsafe, as the definition of Rx long assumed. It is often that there is not enough knowledge about it (Hearings, 1983: 30). Long-term experience with an Rx drug is taken as evidence of safety and hastens the conferral of OTC status.[16]

II. CULTURE AND SOCIAL CLIMATE FACILITATE THE SWITCH MOVEMENT

A favorable cultural and social context is critical, perhaps a necessary though not sufficient condition, for policy making off-the-agenda. The enormous, almost unopposed success of the Rx to OTC switches did not occur in a vacuum, independently of context. They are the result of a climate of opinion that is tremendously supportive. Intellectual, political, and economic currents prepared the ground for the switch movement. Increased confidence in individual autonomy, a loss of faith in science and medical expertise, the rise of deregulation, and a growing concern with cost containment all set the stage. At other historical points in time a switch movement, such as that we are observing, might have been impossible. Today it appears logical and reasonable.

---

[16] While this may be true it is certainly not always the case. Nadakavukaren (1990:250) reports that many items that have been on the GRAS (Generally Recognized as Safe) list for decades are now being removed.

a) Individualism in America: The Modern, Sophisticated Consumer and Self-Medication

A number of public beliefs, true or not, encourage switching prescription drugs to OTC status because it empowers patients. Consumers of health care, today, are thought to be more analytically skillful, better educated, and consequently more able to make decisions about their own health (Silverman, 1987:1; Fisher, 1987:4; Blishen, 1991: 146).[17] Citizens have "demanded more freedom to self-medicate and to exert control over their own health" (Cope, 1991:4).[18] Medical information is widely available and in a form that is comprehensible at least to the college-educated citizen. Many physicians, insurers, drug manufacturers, and the Food and Drug Administration conclude that patients today are capable and sophisticated (Hearings, 1983: 2-24). If, in the past Rx status used to mean that the citizens needed the physician to assist in using a drug safely, effectively, and with success, today the switch movement implies that even in the case of complex drug administration, patients can learn about the precautions necessary just as well from the written material accompanying the package as from a physician. This presumes that if an individual is literate, then information about dosage, and warnings about side effects can be written in understandable language.

American individualism, expressed as the desire to have control over one's destiny, reinforces the right to self-medication and supports the Rx to OTC switch movement.[19] When Rx drug status was implemented it was with the explicit intention of not removing the citizens prerogative to self-medicate (see Hearings, 1983; Temin, 1980: 45; 1983: 188). The right to choice in medical care and the right to refuse treatment has long existed but it is more vehemently defended today than ever before (witness the rise of New Age medicine, "alternative medicine" and the increased popularity of homeopathy). The self-medication movement supports switching because it promises "an even broader range of self care with nonprescription medicines" (Cope, 1991:5-7). The Rx to OTC switch is part of a larger societal trend toward individual rights, human rights, civil rights and the "public acceptance of the notion of rights as applied to health care" (Beauchamp, 1990: 148; Cope, 1991:5-7).[20]

For some people prescription status implies a model of medicine where a patient consults a doctor and complies with the advice given without questioning or requiring much explanation. This model is fading for the many Americans who question authority, be it governmental or medical. Patient power is on the rise and doctors are increasingly expected to negotiate treatment with patients and to treat them as equals (Beauchamp, 1990:145). Some even suggest the professional MD's new role, will be that of an advisor, a partner, except in the few instances where the patient is unconscious (Blishen, 1991: 147). Patient preference plays an increasing role in medical decisions and researchers suggest

---

[17] Self-medication has a long history in the U.S. and Western Europe (Berridge and Edwards 1981).

[18] And this has given rise to some very strange alliances and coalitions. For example AIDS activists and drug manufacturers both lobby the government to pressure the FDA to reduce the time it takes to approve a new drug.

[19] Self-medication is a "matter of convenience" for many (Cope, 1991:4) but it has a down side as well. For those without medical health insurance self-medication may be more a necessity than a choice.

[20] Berridge and Edwards (1981:204) suggest that public experience and high levels of self-medication with even dangerous drugs such as opium in England in the 19th century "resulted in no persuasive evidence of large-scale social incapacity. . . " Associated mortality levels while "not too disastrous," were greater than would be accepted today.

ways of presenting risk data so that patients can assess whether they want to accept the diagnosis and treatment recommended by their doctor (Chassin, et al, 1987;:2457). Self-medication advocates even argue that "consumers will be the primary practitioners in the new health care system," (Ferguson, 1992: 9).[21]

b) The Decline of Faith in Science and Medical Expertise

The Rx to OTC movement takes place in an atmosphere where the prestige of science is on the decline and this leads to a questioning of the rationale by which medical doctors, "scientific experts," are accorded the power to restrict access to drugs. Many conclude that science has failed in the sense that it does not have a single "right" answer for every question (Rosenau, 1992: 6-7). Doubts about the legitimacy of expert, scientific opinion emerge. A parallel critique of medicine follows (Widgery, 1989: 897) because the mystic of the medical profession is closely linked to that of science.

There are a number of bases for questioning the authority of medical knowledge and these undermine the expert role of physicians thus supporting the view that more drugs should be available over-the-counter. The present state of science does not allow for "the selection of a unique 'best drug'" (Temin, 1980:8-12). Drug effectiveness is vaguely defined and poorly measured. Side-effects vary from person to person. Studies of these phenomena are expensive and difficult. Most doctors lack the technical skill to evaluate drugs in every case. (Temin, 1980). Prescription drug choices, as it turns out, are often customs, sustained by the local medical community rather than a designation of the "best" drug available. The broad distribution of information about liability suits, medical mistakes, and the suggestion of widespread inappropriate use of medical procedures (Wenneker, 1990: 1259), have also made the public more critical and suspicious of medical expertise (Lambert, 1978; Blishen, 1991:146).

c) Deregulation

The enthusiasm for removing government regulation across the board has encouraged the Rx to OTC switch (Young, 1988: 24). There has been a change of opinion about the government's role in the modern Western world today. Government intervention is viewed with suspicion and government is no longer seen as responsible for citizen welfare so much as an umpire who intrudes as little as possible. The deregulation philosophy calls for "minimal government," and for government to withdraw from the private lives of citizens. Government regulation is viewed as interfering with healthy competition, as discouraging innovation, and as causing higher prices (Fletcher, 1967; Feder, 1992: E1; Quirk, 1980:195). The trend to switch from Rx to OTC parallels the desire to reduce government's role. In the 1930s the spirit of regulation received broad approval and the government's monitoring of unsafe medication to protect citizens was viewed as appropriate (Temin, 1980:55; Quirk, 1980).[22] Efforts to reduce the power of the FDA so as

---

[21] Seventy to ninety percent of "illness episodes" are self-treated. Both Rx and OTC medications are involved, saved over time and exchanged between family members (Segal, 1990: 301-302). The switch movement is likely to encourage this trend. Little data is available on this group as a whole but specific studies of particular drugs are available.

[22] Temin suggests that by initiating prescription status for drugs in 1938 the FDA was overstepping legal bounds and restricting citizens rights to self-medicate. He argues that citizens have the right to "ineffective treatment" if they want it (Temin, 1980a: 162, 205-206).

to accord greater and freer access to medication began in the mid-1970s (Wardell and Lasagna, 1975). By the 1980s sentiment grew for allowing citizens to assume the consequence for their own risks, not just in the area of medication but in all areas of life (Temin, 1980). Self-medication was said by some to be a "God-given right" (Silverman and Lee, 1974). "U.S. patients have forgone significant health benefits because of regulatory delays and obtained only modest benefits from their reduced exposure to risk" (Grabowski and Vernon, 1983). Extreme advocates even suggest that citizens even have the "right to kill themselves" with home remedies if they so desire (Silverman and Lee, 1974: 211). Rx status is assumed to interfere with self-medication (Temin, 1979B) while the greater availability of OTCs enhances and encourages this option.

d) Cost-Containment

Runaway health care costs generate enthusiasm for the Rx to OTC switch. Proponents argues that switching drugs to OTC status is one way to save money because it reduces the number of doctor visits and lowers drug prices (Temin, 1982; 1983: 189; FDA/PA Symposium, 1988: 7-11; Young, 1988:9). James Cope, President of the NDMA, suggests that "self-care with self-medication is the largest component of our health-care system and the least costly" (quoted in Segal, 1991:11). Studies undertaken by drug manufacturers, world wide, support the virtues of cheaper OTC drugs and the capacity of citizens to use them safely (Proprietary Association, 1984; WFPMM, no date).[23]

III. PHARMACEUTICAL MANUFACTURERS

The interests of the pharmaceutical drug manufacturers were clearly advanced by switching and they spoke out in favor of it not as a general policy option but rather on a case by case basis. Without their advocacy it is unlikely that this off-the-agenda policy making would be taking place. The pharmaceutical manufacturers support the easing of restrictions on over-the-counter availability because non-prescription status results in wider use, increased sales, and higher returns to the manufacturers (Temin, 1990:3; Howard and Madhavan, 1992:6). They are fully aware of the special circumstances which have made switching possible: an unusually positive context and little organized opposition. As Peter May (1991) predicts with respect to "policies without publics," such issue areas may be monopolized by the only group to be organized. The pharmaceutical industry, whose interests were clearly defined and homogeneous, moved unopposed to advance the switch movement and to consolidate gains.

Today Rx to OTC switches are initiated almost exclusively by drug manufacturers though this was not always the case. In the 1970s some switches were proposed by the advisory panels or the FDA itself.[24] Between 1976 and 1982 the FDA approved only 18 of 27 switches suggested by advisory panels (Hearings 1983:10-13). "Forty-nine

---

[23] But it is debatable whether the switch movement reflects cost containment or cost shifting. "Cost-benefit analysis counts all people equally," and switching has a different impact on various sectors of society. Medicare and Medicaid do not always cover drugs but where they do, payment is almost always limited to Rx medication. The switch movement will reduce government costs substantially as recipients are expected to pay for their own OTC drugs. Many insurance companies and HMOs, if they cover drugs to their clients, reduce their costs when drugs are switched to OTC because reimbursement is limited to Rx drugs. This is discussed in more detail below.

[24] In a few cases FDA personnel inaugurated a switch (Hearings, 1983:11) but this was the exception.

ingredients/dosages were transferred from prescription to OTC status as a consequence of FDA's OTC review" (NDMA Fact Sheet, 12/91). By the end of the 1970s nearly all switches were being requested by the drug manufacturers or by a petition put forward by a group of companies within the pharmaceutical industry (Hadeler, 1985:3, 24). Such action has proved easier when only a few producers are involved as this makes uniformity a relatively simple matter and minimizes FDA involvement (Hearings, 1983:11). Nearly all of the 50 or more switch petitions expected to be filed through 1997 will be sponsored by the manufacturers.[25] Such important medications as Zantac, Tagament, and Naprosyn are on the agenda (Winters and Freeman, 1990:3-4).

As a result of switching, drug manufacturers have developed a whole new marketing strategy for drugs coming on the market. Planning begins as much as four years before the medication is approved.[26] Drugs are expected to be Rx-only initially. After a few years a switched is planned and an OTC version is presented for the market (Winters and Freeman: 1990:11). Taking advantage of the previous prescription status in advertising, drug manufacturers contend that because formerly only doctors could provide it, the medication must be effective and desirable (Hearings, 1983:49-50). The motivation to obtain OTC status for a drug is especially compelling as the drug comes off patent. The profitability of a drug that remains on Rx status will be reduced when the patent ends and sales drop 25-40% as generics enter the market (Winters and Freeman, 1990:4).

Historically manufacturers have needed doctors and pharmacists as vehicles to promote and market their Rx products. Switching means that they are no longer dependent on intermediaries for the sale of these particular drugs. Substantial savings can be had by eliminating detailers who visit doctors and educate them as to the benefits of Rx products. The potential for savings is substantial as drug "companies spend more than $5,000 per doctor per year on marketing activities" (Rosenthal, 1991 A1, B11). OTC marketing also by-passes the pharmacist who is expected to do little counseling on the OTC drugs. The switch from Rx to OTC may mean that a lower proportion of drug profits go to MDs and pharmacies and a higher percentage remains with the manufacturers.[27]

Drug manufacturers understand the need to take precautions to preserve the gains achieved from the switch movement. Representatives of their professional associations counsel caution, responsibility, and moderation (Young, 1988: 58). The importance of public relations is stressed including the need to educate "over cautious" health care providers who might oppose the switch. Members are urged to support the FDA inasmuch it fosters switching. Voluntary forms of industry self-regulation are emphasized. Such actions include providing clear, understandable readable labels for all switched drugs, respecting industry guidelines for packaging and mail samples, following generally recognized and respectable business practices aimed at consumer satisfaction, being

---

[25] According to an interview with David Spangler, NDMA, Jan. 15, 1992.

[26] Most companies produce both OTCs and Rx drugs, though the two divisions are not always integrated. The switch revolution has provided the rationale and motivation for such co-ordination (Rosen, 1991). Switching of Rx to OTC has become part of merger strategies as well. See F-D-C Reports ("The Pink Sheet") August 24, 1992.

[27] The drug industry has complained of poor profits (Industry Perspective) and research by the American Enterprise Institute supports this contention (Statman, 1983:7). On the other hand, Fortune Magazine (August 1988) says drug industry profits increased nearly 40 % in 1987, 11 percent in 1988 (Gilbert, 1990: 31). Whatever the case, there is little debate about the fact that switched drugs are among the most profitable sectors (Silverman and Lee, 1974: 213; Rosen, 1991).

truthful and fair in advertising because "misuse of these methods of communication and legitimate salesmanship can dampen the weather and help poison the climate in which you operate" (Cope, 1991:12). Professional associations representing manufacturers fear that without caution the switch movement could be reversed.[28]

IV. THE PHANTOM PUBLICS

Another reason why switching and the consequence re-definition of Rx never got on the public policy agenda is that some of those powerful group (consumers, pharmacists, insurance companies, HMOs, etc.) whose interests are seriously affected by switching, can not act, in good part, because the impact on their members is complex, favorable for some and detrimental for others. Unable to take a position without offending part of their constituency they simply ignored the issue. Policy making off-the-agenda, therefore, is not a classic case of "policy without publics," The public is present though it's potential is not being realized.

a) Consumers: On the One Hand and on the Other Hand

The effect of Rx to OTC switching on consumers is difficult to calculate. Consumers are better off in some ways but there are disadvantages for them as well. Switched drugs are a convenience because consumers can purchase them at a local pharmacy and save not only the cost of a doctor visit but the need to arrange for child care, to take time off from work, and to find transportation. Consumers are also relieved of having to fill out insurance claims for doctor visits, if they have coverage. On the other hand, the costs of switched medication sometimes increases when a medication first goes OTC, especially if the drug is still on patent (Hearings, 1983:43-44).[29] In the long run the price of switched drugs tends to decline, especially when the patent runs out and competition drives down the price. For those who feel competent and comfortable self-mediating, the switch movement is a welcome fact of life.

Not all consumers benefit from the switch movement. For consumers who have health insurance or are covered under government plans that reimburse only for Rx drugs the switch is a net loss. Once switched, medications are no longer covered. They must be paid for out of the consumer's pocket (Cope, 1991:7). There are also increased hazards for the consumer involved in self-diagnosis and self-medication with switched drugs and these costs must also be entered into any assessment of net loss or gain. Some switched drugs are toxic, especially if purchased in OTC form but taken in prescription strength. Consumers also lose whatever value accrues from the expert assistance and advice of the physician.

---

[28] The recent move by the FDA to "disentangle marketing from scientific exchange" marks just such an area where ethical conflict of interest was too quickly set aside." A flurry of falsified test results submitted to the FDA as part of the drug approval process is another example (Kolata, 1992:1, 16).

[29] This is because manufacturers have the monopoly and can pass the full costs of advertising, new labelling, and promotion of the switched drug on to the consumer. For example, when Alupent was switched a 13 million dollar advertising campaign initiated its OTC status and this cost was passed on to the consumer.

b) Insurance Companies and HMOs

The impact of switched drugs on insurance companies and other payers is a complex interaction of physician behavior, patient actions and how the switched drugs actually go OTC i.e. in all forms, only at low doses, or simultaneously with a new combination version (a combination that will stay Rx with a new component incorporated). There are some benefits for insurance companies and HMOs that usually reimburse clients for Rx drugs but not OTC medication. In addition to savings on drugs these payers might reasonably conclude that if certain medications were available OTC, visits to the doctor on the part of those they insure would be reduced.

But HMOs and insurance companies have not been active in an obvious manner to advance their interests if indeed switching advances their interests. I found no reports of their making presentations at advisory committees, for example. Might this be because obvious benefits must be weighted against costs which are difficult to assess?

Many switched drugs are indispensable for health and even life-sustaining. But some of them have significant side effects. If misuse of OTCs makes for an increase in doctor visits and/or hospital admissions, then little will be saved. "A study of the American Hospital Association has estimated that 7 percent of all hospital admissions are related to the misuse of prescribed pharmaceuticals, and in 1983, such drug-induced illness led to an estimated 2.7 million admissions costing up to $5 billion." (Luce, 1988: 288; Morse, 1986:58; Beard 1992). But little or nothing has been published on the consequences of side effects or the misuse of switched OTCs. Misuse may result from an inability to read OTC labels or a refusal to take heed of warnings about usage. The groups most susceptible to these adverse effects of OTCs, of switched drugs, include pregnant women, children, the elderly (Beard, 1992), those taking multiple drugs or those with a specific disease status (such as diabetics) that cause them to be particularly vulnerable (Teplitsky, 1985; Lamy, 1983; Hadeler, 1985).[30] Individual variability in reactions to drugs also suggests that the Rx to OTC switched drugs may present problems. Finally, switched drugs may be employed by individuals who should see a doctor but who rather take a switched drug that temporarily relieves symptoms while the conditions gets increasingly serious and more difficult to treat (Silverman and Less, 1974: Hearings, 1983: 9).[31] All these are matters of serious consideration for HMOs and insurance companies - without more information it is hard for them to take a stand on the Rx to OTC switches.[32]

For non-staff HMOs, prospective payment and non-capitated organizations where the payer has no physicians on staff, the impact of the switch movement will also be

---

[30] The misuse of OTC drugs in the Third World has been studied by anthropologists. "There is overuse and abuse of antibiotics and injections of all kinds, given and prescribed freely by almost all practitioners, folk and cosmopolitan." Drug company detail-men do not provide knowledge of hazards and side effects but only emphasize benefits. Multiple use of different drugs leads to unanticipated adverse interaction effects (Cosminsky and Scrimshaw, 1980: 276).

[31] It has been suggested that the misuse and abuse of OTCs is underreported and therefore the public is not aware of its importance because the mass media avoids reporting on it since so much advertising revenue comes from OTC drugs. Some science editors report that "pharmaceutical companies threaten to withhold advertising if a magazine publishes articles unfavorable to its products" (Consumer Reports, 1992b; 142).

[32] Insurance plans and HMOs, as well as Medicaid and Medicare, that provide complete health care coverage may need to begin to provide OTCs if they are to avoid greater expense in terms of treating sicker patients at a later date.

difficult to forecast. Here there is competition between different components of the system and an incentive for physicians to see patients over and over. These types of HMOs have limited control over the physicians who care for their clients and they do not have specific formularies that required certain medications be employed for specific treatments. Non-staff HMOs worry about "adverse selection." Their programs only pay for Rx drugs and they find that faced with the switch movement patients are responding by asking the doctor for a prescription version of a drug rather than paying for the OTC version out of pocket. In this case the HMO still pays for the medication.[33]

It is, however, likely that even without control of physicians and without formularies, the switch revolution will reduce costs (fewer doctor visits and fewer prescriptions written). Those I interviewed suggested that on balance, a net savings was probable and they believed that eventually the savings would be passed on to the consumer in the form of lower premiums or greater benefits.

For staff HMOs (such as Kaiser in Los Angeles) the benefits of the switch movement are clear though publicly they express uncertainty. They say that they are aware of the switch revolution but that they are not doing any studies on it or paying much attention to it. They treat switched drugs on a case by case basis. If a drug is switched they do not immediately cut off drug benefits - free provision of drugs may continue for a time for those with coverage (not all of Kaiser's members are covered - only 76%) if only because the OTC format will not be immediately available.

Staff HMOs do an "intuitive cost-benefit analysis." Some drugs that have been switched may still be provided without cost in the future because the drug is essential to the patient. Patients would return for care in a more serious condition if they didn't get the medication required.[34] In these circumstances the doctor may prescribe a form of a drugs that has not yet been switched.[35] But staff HMOs expect a savings in the case of many switched drugs where OTC drug availability will result in fewer doctor visits.[36]

c) Pharmacists and Retailers

Pharmacists and retailers of Rx and OTC did not take an official position on switching for economic considerations and because of professional aspirations. In the U.S. many pharmacists own their own retail outlet pharmacies and if they are unaware of the implications of switch for their economic status it is, perhaps, because though they have a lot at stake the impact on them is complex. These pharmacists see some shift in sales. But the decline in profits in one category of products is likely to be offset by gains in other drug sales. A survey found 42% of pharmacists thought switching would be good for pharmacy while 29% felt its impact would be negative (American Druggist 1984: 12).

---

[33] This point and those in the above paragraph were made by Dr. Craig Stern of CareAmerica Health Plans. The problem for the HMOs as far as studying the impact of switching is that pharmacy record data bases and medical visits data are not linked. So much of what one expects to happen is based on guess work. There is no certainty in assessing the costs and benefits of switching.

[34] Hydrocortisone 1% is offered as an example.

[35] This point was made by Steven Litsey, Pharmacy Director at Kaiser, Los Angeles.

[36] Gyne-Lotrimin is an example.

Chain drug stores support the switch movement arguing it will "help reduce the costs of drugs". They are supportive of the FDA's encouraging the switch movement and express confidence in it's leadership.[37] They expect switched drugs will mean greater revenues. But this assessment does not take into account the possibility that some switching will cause sales of other products to decline.[38]

Profit margins to pharmacies on certain switched products may, in fact, be quite small if the drug in question is marketed by the manufacturer as a brand name product. This is because manufacturers charge a relatively high price to retail outlets for brand name products and retailers have no choice but to settle for a small mark-up because consumers use these easily identified brand names to assess the retailer's general pricing policy. Sometimes brand name drugs are used as loss leaders, that is they are sold below cost in order to create a positive price image for the outlet. If the switched product is marketed as a generic then the pharmacy's profit margin is considerably higher.[39]

Pharmacist reaction to the Rx to OTC switching may depend on where they are located in the market system. Some pharmacists like the idea that they can recommend very effective medication to patients (Bectel, 1984: 185). Others quite correctly see their profession as changing[40] and many of them assess the switch movement as an opportunity to expand their contribution to the health care field. Today pharmacists are no longer simply mixing medication. They do more counselling as to purchases and more education of customers about medication use, interactions, and potential side effects. But so far, pharmacists' efforts to employ the Rx to OTC movement as a vehicle to achieve recognition and compensation for these increased responsibilities have been without success.

The NARD (National Association of Retail Druggists) and the American Society of Hospital Pharmacists (Gans and Hogan, 1985) suggest that switched drugs be given the status of "pharmacist-legend class." This would mean that they would be available only with counseling from a pharmacist (Madhavan, 1993). This proposal amounts to establishing three categories of drugs: those administered under prescription by MDs (Rx), those available without a prescription but under advice from pharmacists, and those sold in the general market place (OTC) (Segal, 1991:11). This situation already exists in Germany, France, Switzerland, parts of Canada (British Columbia) and the state of Florida.

Efforts to establish a third category of drugs in the U.S. meets strong opposition. The Proprietary Association viewed it as reducing the market for their products. It has also been rejected by the FDA (Hadeler, 1985). The Department of Justice argued against it because it might "restrain competition, inconvenience the consumer, depart from U.S.

---

37 Personal correspondence from R. L. Ziegler, President of the National Association of Chain Drug Stores.

38 "When ibuprofen came on the market, it didn't expand the analgesic market; it took sales from aspirin and acetaminophen" (Gopal, 1991: 45).

39 Hosein Salehi suggested this analysis to me.

40 Consumers do pay for pharmacists counseling in the sense that small pharmacies, where the pharmacist is more accessible, charge more for drugs and "counseling" is included in the price.

economic policy, and cause price increases for the consumer with no attending benefit" (Segal, 1991:11).[41]

V. PHYSICIANS: THE FAILURE TO MOBILIZE

In one case those affected by switching failed to intervene even though it is clearly in their economic interest to make the case against switching. The Rx to OTC switch stakes are high for the medical profession; its economic impact on physicians is largely negative. My interviews with physicians suggest that they are either unaware of the fact or they dismiss its significance. They seem to view switching as a "scientific," not a "political, economic or social question." Many assume that there is something unprofessional about examining switches from the point of view of how it will affect their income.

Doctors are the gatekeepers of medication accessibility and this role is being eroded.[42] If drugs are available over-the-counter then visits to the doctor will decline as a result. A doctor's overall income could be reduced as former patients simply purchase the medication they conclude they need over-the-counter. It is estimated that nearly 50 million dollars in payments for doctor visits was saved in one year, 1989, when cold remedies were switched from Rx to OTC status (Temin, 1990:3). One third billion was saved in doctor visits when .5% hydrocortisone was switched (NDMA 12/91). By the year 2000 the savings in costs from reduced doctor visits due to OTC use is expected to be nearly 20 billion dollars (Proprietary Association, 1988:17).

The Rx to OTC switch also limits doctors' ability to satisfy patients' needs in another sense. Some patients feel they are not getting their money's worth from a paid visit if the only advice they receive from their physician is to purchase an OTC drug. Had the patient known in advance they would have skipped the doctor visit and purchased the medication at their local pharmacy.[43]

Two reasons account for the medical profession's inability to respond to their professional self-interest vis-a-vis switching. First, the evolution of the profession itself has resulted in lower job satisfaction and reduced morale, factors which mediate against effective defensive action in situations where professional interests are at stake such as is

---

[41] The failure of the proposal to establish a pharmacist-legend class of drugs represents a considerable set back for pharmacists. The switch movement has benefited this group very little and the window of opportunity it opened was quickly closed

[42] This loss of power may have been underway independently of the switch revolution. When individuals paid for drugs, doctor's authority was critical; now third party payers are involved. Doctors are "losing authority over prescriptions as hard-bargaining hospitals, employer-insurer groups and health maintenance organizations dictate decisions and force price discounts" (Freudenheim, 1992b: 6).

[43] Pharmaceutical manufacturers are aware of this problem and they realize that physicians need to have Rx forms of drugs available to meet patient expectations. In response to this situation and based on the logic that a higher dosage of a drug merits closer medical supervision, many drug companies continue to market a Rx form of many switched drugs. The only difference is that the Rx version of the drug is presented in a larger dosage format. Patients could, of course, quite correctly conclude that the same Rx dose is available without prescription and with the same effect by simply taking more of the OTC format drug.

the case with the Rx to OTC switches.[44] Second, the profession's representative association, the AMA, has failed to adjust to changes in society at large and to changes in the medical profession in particular. Both will be examined here.

a) Lower Professional Prestige

Physicians have suffered a decline in prestige and a loss of practitioner freedom and autonomy and this has made them more vulnerable as a group and puts them at a disadvantage when their collective self-interest comes into conflict with other more powerful groups. There is an over-supply of physicians in many geographical areas and in many professional specialities and this aggravates the situation. Increased medical specialization has also lead to professional fragmentation and a decline of internal professional unity.

In an effort to reduce costs and survive in a very competitive market environment non-medical authorities, payers intrude on physician's expectations regarding professional respect, authority, and independence. Payers (Medicare and Medicaid included) develop practice guidelines and demand that physicians abide by them. Increasingly physicians, especially younger doctors (up to 50% of them), are salaried employees of health provider organizations such as HMOs (Leary 1992C; Roper et al, 1988). Even those remaining in private (solo) practice, are faced with fixed fee schedules and shrinking income (McKinley and Stoechle 1988:195). Physicians find themselves in situation where they are financially penalized for aggressively treating, for ordering tests etc., (Welch, Hillman, and Pauly, 1990; Feldman et al (1990). Their authority to make decisions in what they see to be their patient's best interest is no longer respected (Wennberg, 1990:1202; Wenneker, 1990:1257, 1259; Chassin, 1987:2547; Hearings, 1983:30). Those practitioners who do "contract work" are being evaluated with computer software that tracks whether a doctor conforms to insurance company or HMO policies that are designed to cut the costs of diagnostic procedures and treatment. The results are used to "reward or dismiss doctors" (Rice, 1992; 33-34; Freudenheim 1992C: C2). The medical profession is losing "control over certain prerogatives relating to the location, content, and essentiality of its task activity . . . . This is concurrent with the re-organization of medical practice as any other corporate enterprise" (McKinley and Stoeckle, 1988: 191).

b) The American Medical Association (AMA) Fails to Respond to Switching

The AMA, the major professional representative of physicians, is unprepared, perhaps unable, to defend the interests of its members who themselves do not understand what is at stake in the switch movement. The AMA is generally thought of as a powerful, well-financed lobby but the switch movement fails to provide evidence to confirm this.[45] It has worked closely with the Pharmaceutical Manufacturers Association as an advocacy coalition on many issues, taking a unified front vis-a-vis the FDA (Meier, 1985:82). This historical alliance may have impeded the AMA's perceiving that on this issue, physician

---

[44] See the Milbank Quarterly, vol. 66, supplement 2, 1988 for an extensive assessment of the evolution of the medical profession both nationally and internationally.

[45] Temin argues that the AMA never was very effective. He suggests that doctors were "passive recipients" of the benefits of the establishment of prescription drug status to begin with. "By curbing self-medication, the government channeled business to doctors and increased the value of their licenses" (Temin, 1980A:55). It is ironic that they are equally absent from the arena when these "benefits" are being eroded.

interests and those of the pharmaceutical industry differ.[46] But the principal reasons for AMA ineffectiveness in the case of switching may be a reflection of growing budgetary and structural problems.

First, the AMA has not kept up with societal evolution and the changing nature of the medical profession. It represents, for the most part, those in solo practice and this is, increasingly, a minority of medical doctors. There is little incentive for salaried MDs or those in group practice that contract with insurance companies to join the AMA. As relevance declines, its membership shrinks (Belkin, 1991) and this results in less revenue and a less effective presentation of AMA views in the public sphere.

Second, AMA ineffectiveness is also a function of structural factors. It is a highly decentralized, democratically and horizontally organized association. These characteristics do not make for efficient self-defense of interests. No surprise then that the "AMA sees itself as a "reactive" rather than an 'offensive lobby'".[47]

Third, the internal organization of the AMA is highly consultative, to the point of reducing effective political representation of its members. The AMA's structure produces high quality position papers but it is a slow and laborious process. For an issue to receive attention it must be put on the national AMA agenda by a state organization and/or a speciality AMA associated group. Proposals first go to a science reference committee. Often a proposal will be sent back for more information, data and evidence. Next it is referred to the House of Delegates for adoption or it is referred to the Board of Trustees for an appropriate resolution. Medical speciality groups "hold the data card" and they have the first say. They have the evidence required to take a position and the national office is not always informed immediately. In addition, the national AMA must be careful to avoid appearing to invade the territory of the speciality organizations or state associations. As a result the national AMA consciously did not lobby the FDA on switching.

This organizational structure and this form of division of labor has means that when the AMA, or any one of its subunits, is finally ready to act, it sometimes, fails to see the larger issues. In the case of the switch movement it got bogged down in the sub-issues. It focused on argument around a particular drug rather than the switch movement itself.[48]

Finally, AMA officials admit to paying too little attention to the switch movement because there are many other pressing issues facing the organization today. Budget problems and the amount of money the AMA has to put into these kinds of topics is limited. A choice as to where to focus has to be made. Today AMA representatives estimate that questions involving the safety, efficacy and cost of new Rx drugs (biotech) are of more central import. The AMA regards OTC drugs, in general, to be non-toxic and

---

[46] The AMA representative to a symposium on Rx to OTC switches organized by the Proprietary Association, November 1, 1982, enthusiastically supported the move even though the implications of reduced doctor visits and the potential problem of surplus doctors in the U.S. were explicitly pointed out (Proprietary Association, 1982:20, 22-23).

[47] For example, only after metaproterenol sulfate inhalation aerosols were made available OTC in 1982, at the FDA's request, did the medical community get involved. Physicians did succeed, however, in having the decision reversed (Hearings, 1983: 6-20; Segal, 1991:11).

[48] Much of this information about the AMA comes from an interview with Dr. Bennett of the AMA. The interpretations are in all cases my own.

harmless so it seems reasonable to turn attention to other matters where the safety of products is not so certain.

VI. THE BUREAUCRACY AND OFF-THE-AGENDA POLICY: THE FDA

Policy making off-the-agenda may often involves close cooperation and mutual understanding between government bureaucracy and an interested private sector actor (Peters, 1993: 55). The FDA was sensitive to pharmaceutical industry need of Rx to OTC switches. In the 1970s the FDA critically rejected half of all switches proposed by its advisory committees but, today, it is far more receptive and accepting of industry requests for switches. Guidelines and procedures have been developed over the years in conjunction with industry to the point where switching is a regularized, routinized procedure.

What began as an incremental departure from an existing policy, switching a few drugs, ended up as a more important policy change. The drug manufacturers never demanded blanket policy changes or a sweeping modifications in the status quo (Peters, 1993:57). Had this been the case the issue would have been brought to public attention and would have become part of the policy agenda. Rather, they indicated a willingness to "work with the government to help government expedite switches" on a case by case basis (Cope, 1991:8). Dr. Frank E. Young, became Commissioner of Food and Drugs for the FDA in July 1984 and he was highly favorable to industry initiatives on switching and he brought the FDA with him on this issue (Young, 1988:4). Under his leadership, for example, the FDA and the Proprietary Association (representatives of OTC manufacturing sector) jointly sponsored conferences on the topic (Proprietary Association, 1988). The situation remains much the same with David Kessler thus facilitating the ongoing incremental decisions that result in a qualitative change in the definition of Rx.

Policy making off-the-agenda can be beneficial to the governmental bureaucracy. The pharmaceutical industry has been very supportive of the FDA on this issue, calling upon the government to strengthen the FDA, increase its authority, and expand and enhance its power and prestige. The industry requested government allocate more resources to the FDA so that it could better carry out its responsibilities for switching drugs quickly (Merck, no date, 23-28).[49] This level of support for a regulatory agency in a period when representatives of most industries are calling for less government involvement is striking (Cope, 1991:7).[50]

---

[49] Personal communication, John Gans, Executive Vice-President, American Pharmaceutical Association, March 1, 1990.

[50] The drug industries may endorse the switch revolution but their support for the FDA is narrow and does not represent a clear case of "capture". Many important individuals within the FDA are/were approving of the Rx to OTC movement. But the FDA's relationships with the drug manufacturer's is much more complicated, ranging over time from cooperative to hostile depending on the issue. But cooperation on one issue is not sufficient for concluding capture exists. For example the Pharmaceutical Manufacturers Association opposed a Congressional bill to give the FDA subpoena power last year. It also lobbied against changing secrecy regulations that protect industry products but hinder FDA access to data necessary for assessing the safety of drugs and medical devices (Kolata, 1992: 1, 16). The pharmaceutical industry apparently only supports giving the FDA powers and resources that will facilitate the FDA's serving industry needs, such as funds to speed the drug review process (Merck, no date: 28), and the Rx to OTC switch. Given this, it is hard to conclude that the FDA is a "captured" regulatory agency. Cases of fairly close cooperation such as that of the Rx to OTC switch are less frequent than instances of disagreement (Meier,1985: 84-87).

VIII. SUMMARY AND CONCLUSION

While getting on the agenda may be critical for policy making and the power to set the agenda is very important it is neither necessary nor sufficient for policy making or policy change of substantial importance. While it may be "easier by far to tell when an issue has achieved the agenda than when it has not" (Helson, 1984:231), the fact that is has not been put on the policy agenda should not be taken to mean that policy has not been produced. Policy made off-the-agenda may be like a black hole in physics, largely invisible but with important material consequences. In both cases the "invisible" is harder to study than what is discernible, evident and manifest. Policy that is actually on the agenda and formally considered is easier to study than policy off the agenda. One important tool for establishing the existence of such off-the-agenda policy making may be temporal comparative analysis. If policy making has taken place or if policy change has occurred, its effects can be observed by comparing a given situation at two points in time. Even if the process is so subtle as to escape notice on a day to day basis, temporal comparative analysis can be of assistance.

In the case of the Rx to OTC switches and the implicit policy change with respect to definition of prescription medications that it involved, the usual, formal procedures for eliciting policies and policy change never took place. Rx has come, in many cases, to mean a temporary trial period for accumulating evidence of safety and doing a cost-benefit analysis of risk rather than a definite designation of administration only under a physicians supervision because a medication is potentially harmful and toxic (Kaplan, 1982:5).

Conspiratorial explanations are not required to understand policy off-the-agenda. Peters hints at a new model of policy formulation - one which accepts that policy changes can occur without formal recognition (1993:55). May (1991) develops of model of "policies without publics" which is also helpful. Both contribute to our understanding of the case study offered here and policy making off-the-agenda.

From this case study hypotheses about off-the-agenda policy making, such as that implied by the Rx to OTC switch movement, can be formulated. First, such policy is more likely if contextual factors are favorable, when the cultural environment, intellectual currents, political climate and national economic policy encourage it. Second, interest aggregation may not develop in a normal fashion in part because the consequences of the proposed policy are and its impact varies widely within groups. This constrains groups from taking a position and acting on it. Other groups with a substantial interest may fail to act for extraneous reasons and this too permits policy making off-the-agenda. The AMA is an example in the case of switching. As a result the pluralist conflict that usually accompanies agenda setting and policy change may not occur. In this case study the pharmaceutical sector's goals were largely met without substantial qualification. Third, the probability of major policy change off-the-agenda is enhanced when the government agency responsible for its implementation, the FDA in this case, is predisposed to favor it.

COGNITION, VALUE AND CULTURE: A DEVELOPMENTAL ANALYSIS OF POLITICAL EVALUATION

Shawn W. Rosenberg
Graduate Program in Political Psychology
School of Social Sciences
University of California, Irvine, CA 92717
BITNET: SWROSENB@UCI.VMSA

Paper presented at
the Annual Meeting of the American Political Science Association
Washington, D.C., September 2-5, 1993

What people value and how they judge political events are of ongoing interest to political science. Typically the analysis of political values focuses on people's attitudes. In empirical studies, subjects are presented with issues or events of current public interest and asked to express their opinion, usually in some close-ended bipolar format. The research reported in this paper is oriented differently. Rather than looking at attitudes, the final product of a reasoning process, an attempt is made to examine how people evaluate political phenomena. Attention thus turns to a consideration of what people focus on when evaluating an event or policy and how they judge it. This is investigated through in-depth interviews in which subjects are asked to explain in an open-ended fashion what is important to them.

While individuals' political evaluations are the focus of the present work, macropolitical considerations of culture and social structure remain central to the theory driving the research. Indeed, a central assumption here is that macrolevel and microlevel political analyses are inextricably intertwined in fundamental ways. Analysis of either kind necessarily depends on the other and therefore each is best pursued with the concerns of the other clearly and explicitly in mind. The paper begins by locating the perspective adopted here relative to those more commonly adopted in the study of politics. The theory of political evaluation and associated empirical research is then presented. The paper concludes with a discussion of the implications of the research for the analysis of political structures and change.

The political psychology of collective phenomena

Political science is generally concerned with how groups do and should make decisions regarding the regulation of social exchange and the allocation of resources. This leads to an analysis of power; how it is defined, created, sustained and exercised. Depending on the political theory adopted, this entails a consideration of such collective phenomena as culture, institutions and social structure. In liberal or methodologically individualist conceptions of politics, individuals are a matter of concern, but they are conceived in minimal terms and are dealt with as a matter of definition. How individuals act and how they differ from one another are understood in terms of the context in which they pursue their purposes. Individual preferences and choices are the medium of political life, but are guided and constrained by cultural settings and social arrangements. The latter are understood to have an objective status of their own which is readily understood by all individuals given adequate exposure and information. Good examples here are liberal analyses of political institutions and the closely related work of neoclassical political economy (e.g., Downs, 1957; Riker, forthcoming) or methodologically individualist analyses of culture and the closely related survey research on public opinion (e.g., Almond and Verba, 1963; Inglehart, 1990.)

In more sociological and methodologically collectivist visions of politics, there is no interest in individuals. The focus is on the structural qualities of culture and forms of political exchange. This is an arena which is self-constituting and therefore must be understood in its own terms. Thus the analysis

focuses on structures of social organization (e.g., Durkheim and Marx), forms of cultural definition (e.g., Foucault, 1978) or types of communicative exchange (e.g., Habermas, 1984/7). Here individuals, their thoughts, purposes or action, are no longer the media of political life, but merely its product. As a result, individual behavior or attitudes are not the proper focus of either explanatory theory or descriptive research. To the degree to which they receive any consideration at all, individuals' behavior, values and cognition are regarded to be a sociohistorical product, a somewhat distorted reflection of culture and/or forms of social exchange.

Here an alternative conception of the individual is adopted. Theory and empirical research is presented which suggests that there is a structure to an individual's thought and action that may vary across people. This structure is reflected in the meanings individuals construct and by the purposes they pursue. At any given moment, this structure determines how the individual will make sense of his/her context and how s/he will interact with others. Over time, it gives impetus and direction to an individual's development and provides a normative standard whereby that progress can be evaluated. Adopting this view, the perspective adopted here challenges the fundamental assumptions regarding human nature adopted in the aforementioned political theories and, by implication, the conceptions of social and political life which build upon them.

Claiming that there is a structure to thinking that varies across individuals, the present research emphasizes the various ways in which individuals construct their understanding of the world and orient their action. In so doing, it raises basic questions regarding the liberal presumption of a universal rationality and the associated rather ill-conceived notion of the common sense. In this theoretical context, the present research calls for a more elaborated conception of the underlying structure of so-called "rational thinking" and a consideration of the various forms this rationality may take. This suggests the need to reconsider the liberal analysis of the interplay between individuals and collective contexts. Consider first the impact of the social and political environment on individuals. It can no longer be assumed that individuals will understand cultural norms or institutional contexts either according to their objective reality or in light of some common sense. In most cases, norms and contexts will be subjectively reconstructed in inadequate and deforming ways and the sense guiding that reconstruction will not be common, but may vary significantly across individuals. As a result, the same cultural and institutional environment may be understood and valued differently by different individuals and therefore have a differential impact on their purposes and actions. In a similar vein, the effect of individuals have on their social and political environment must be reconsidered. The quality of the ends individuals pursue and how they pursue them will be powerfully affected by the structure of their thinking. This must necessarily be reflected in the reality of the types of exchange which emerge and the kinds of norms by which that exchange is interpreted and evaluated. In this manner, the structures of individuals' thinking necessarily has on impact on the possibilities for cultural development and institutional change.

Addressing more sociological theories of politics, the current research challenges the view that meaning and value are only collectively or intersubjectively constituted. It suggests that culturally mediated communication and socially regulated exchange are subjectively reconstructed by the participating individuals according to the structure of their own thinking. Consequently the meaning of collective or intersubjective phenomena and their impact must be conceived, at least in part, with reference to the individuals in question. In another language, politics is not simply a public phenomena with its own internal structure and dynamic. Rather, what is public and shared is always being reconstructed on a private level, a level which may have its own distinctive form and logic. This requires a fundamental reconceptualization of political life. Macrolevel phenomena such as social structure and culture may have their own internal dynamic but this is realized through the actions of individuals and thus is necessarily mediated by the structure of their private understandings and values. Both the nature of structures as they are currently manifest and the manner in which they are transformed must be understood accordingly.

Culture and reason: A developmental political psychology

It is with these considerations in mind that I have developed my own approach, one which combines the insights of macropolitical theory with those of developmental psychology. Consistent with an interdisciplinary intent, I have made several attempts to sketch a framework for a developmental political psychology (e.g., Rosenberg, 1988b, Chapters 1 & 6; Rosenberg, 1991). The result is not a full theory, but rather the foundation upon which such a theory might be constructed.

Briefly stated, I have argued that theorizing in developmental political psychology should be predicated on a recognition that social and political life is always dually structured, both by the determinations of the thinking individual and by those of a defining social structure. These two structuring forces engage one another on the common ground which they regulate and through which they are realized; that is through social interaction and discourse. This interaction and discourse are directed and made meaningful both by the participating individuals and by the social context in which they engage one another. Despite this unification in the concrete specificity of ongoing social exchanges, the two forces are not reducible to one another. The structural qualities of individuals' understandings and purposes cannot be equated with those of a society's regulations and culture. Thus although the substance of a statement or action generally has both a psychological and social reality, the qualities it acquires as it is incorporated in each reality makes its definition in one frame of reference potentially irreducible to the other.

Because of this difference in individual and social structure, there will always be an inherent uncertainty and tension in social life. The uncertainty reflects the fact that meaning and trajectory of a given action or statement oscillates between two sources of determination, psychological or private on the one hand and social or public on the other. Which is primary and most effective

at the moment will always be somewhat uncertain. The tension reflects the fact that the two sources of structuration are always deconstructing and reconstructing each other. Individuals are always assimilating public statements and social regulations in their own subjective terms. They are also directing their own action and discourse accordingly. At the same time, the social structure is always assimilating private meanings and purposes in terms of cultural or intersubjective understandings and regulating discourse and social exchange in a complementary fashion. The resulting struggle for the determination of the meaningfulness of action is complemented by a certain attempt to also to discover that meaningfulness. The latter reflects the fact that both individuals and societies also have the capacity to adapt their structure by accommodating to constraints which are confronted at each level. There in lies the creative potential of social life, both to promote individual development and societal transformation.

Within this skeletal conception of the relationship between psychological and social structure, I have tried to reconstruct certain concepts in political and psychological theory. Most important has been the attempt to argue that, like the social action in which they are realized, structures at each level are dually constituted. At the level of politics and society, I have developed some of these ideas in light of the sociological writings of Jurgen Habermas, Anthony Giddens and Michel Foucault. (Rosenberg, 1988b, 1991). Here I have suggested that social structure not only reflects some internal coordination at the macrolevel, but necessarily incorporates the concrete directions and destructuring influences introduced by the individual members of a society. Social structure must thus be conceived not only as coordinating, defining and integrated, but also as unraveling, fragmenting and designified by the pressure of structural reorganization imposed by individual actors. In this light, I have argued that the interpretation of social realities cannot follow the "linguistic turn" with its claims regarding the unidimensionally public nature of meaning and sociological determination of action. I have also suggested that an understanding of historical development cannot simply focus on the dynamic or internal contradictions of structuration at the macrolevel, but must make sense of these as they reflect and operate on the kinds of meanings and purposes which are crafted by the individual citizens.

Considering structure at the individual level, I have built on the psychological theorizing of Jean Piaget (1971). Here, I have argued that reasoning not only reflects the internal coordinations of mind, Piaget's focus, but also the appropriation of meaning and direction provided by the social environment. Moreover, these two aspects of reasoning imply and depend on each other. It is by virtue of the coordination of action and the construction of meaning which the individual subjectively constructs that s/he can recognize and employ, albeit in crude and limited ways, the language and action strategies available in the environment. At the same time, it is because the social environment does exercise a direct pedagogical influence through the introduction of specific higher order concepts and highlighted repetition of relatively complex exchanges, that the individual can objectify, reflect upon and

thereby fully coordinate his or her own subjectively constructed meanings and purposes.

Consequently I have suggested several modifications of Piaget's conception of cognitive structure and its development. First, as a product of and direction for social action, cognitive structure should be described in the language of action rather than in the language of mathematics. The latter is justified when cognition is thought of as a closed system which entails successive steps in the internally driven progress toward the elaboration of a mathematical logic. It is of less heuristic value when cognition is viewed as an interactive product, dialectically related to concrete, social interaction.

Second, reasoning at any given stage of development must not be seen simply as an internally constructed equilibration of operational activity. Rather than simply being a product of internal coordinations, equilibration is facilitated by, indeed may require, the appropriation of higher order meanings which are culturally or intersubjectively constructed. Therefore, in Piagetian terms, development at one level is always dependent upon the appropriation of social knowledge which is usually considered part of the first substage of the next stage in cognitive development. Thus, the social or political psychological conception of cognition presented here suggests that individual's reasoning at a given moment in development will be lodged between stages as conceptualized by Piaget. (Some of the theoretically anomalous evidence of decalage may be more readily understood in this light.)

Third, the dynamic of development itself must be reconceived. For Piaget, development is motored by the reflexive abstraction of the individual confronted with pragmatic limitations of his or her own understanding. The means and direction of development is understood in exclusively psychological terms. From a social psychological perspective, this captures only one dimension of the process of development. This reflexive abstraction is complemented by the cultural and intersubjective definition and orchestration of action. The relationship between these two dimensions of the developmental dynamic is dialectical, each constraining, guiding and potentially transforming the other. In this context, culture and social structure do not simply provide a context in which development occurs, but are internal to the process. As a result, they delimit the possibilities for psychological development and, in turn, have their own transformation and development tied to psychological determinations. (Some of the theoretically anomalous evidence of many adults who do not reason in a fully equilibrated, formal operational manner may be understood in this light.)

Guided by these considerations, I defined three structures of political reasoning: sequential, linear and systematic. In each case, an attempt was made to explicate the basic mode of reasoning characteristic of the stage, the structure of the understanding generated, and the understanding of the players, action and relationships of social and political life. With the aim of avoiding some of the confusion by paragraph long descriptions of cognitive structure, each structure is described in considerable detail and length (Rosenberg, 1988b; forthcoming). The cognitive aspect of each type of reasoning briefly in the next section, but it is

recommended that the reader make sense of these with reference to the more complete definitions available in the book length expositions.

This theoretical effort has been accompanied by a empirical one. Several studies have been conducted to explore the adequacy with which the structure of an individual's reasoning and differences among individuals may be captured in the terms suggested. In each case, an adult population of varying educational and class background was examined. Typically each subject was interviewed in-depth and participated in an experiment. The interviews required the subject to explain a political event and to discuss a personal situation. In both cases, the subject's initial description and explanation was followed by extensive attempts to probe the meaning of the claims made. This was accomplished either by direct questioning or through the suggestion of alternative scenarios. The experiments, drawn from Piaget's own work, presented subjects with a problem which they were then asked to solve. Both interview and experimental performances were then coded according to theoretically derived typology of structures of reasoning. The results provided strong evidence that a given individual reasoned about substantively very different issues in the same way and that different individuals might reason about the same issue in structurally different ways (Rosenberg, 1987, 1988a, 1988b).

Political evaluation

In the present project, I extend the work on political reasoning to the analysis of the political values individuals hold and the manner in which these values are marshaled in the evaluation of social and political events. In so doing, I expand the definition of the three types of reasoning to include an analysis of the mode of evaluation and the qualitative nature of the values associated with each. The three types of reasoning and evaluation, sequential, linear and systematic are described below, focusing first on the understandings crafted and then on the evaluations made.

SEQUENTIAL THOUGHT. The sequential thinker reasons by tracking the world as it appears before him or her. The focus is on the immediate and concrete events observed and the memories of earlier ones they evoke. These events are understood as moments of an unfolding sequence. The questions which guide the intellectual activity of the sequential thinker are: What does this look like? What happens next? The answers are found primarily through personal observation, either of one's own or another's experience.

The social world constructed by the sequential thinker revolve around what is immediate and present. It consists of the unfolding sequences of events which include the activity of objects, animals and people. The familiar and recurring sequences are learned and the sequential thinker can be a skillful player in them. The understanding of these sequences lacks either causal analysis or categorical definition. Action is not abstracted from the unfolding events of which it is a part. Consequently, cause and effect relations are not explored and notions of necessity are not appropriately or consistently applied. Like action, individuals are conceived in terms of the sequences in which they are involved. They are not

categorical identities and natural objects of thought. If asked to describe an individual, the description offered is concrete, fragmentary and limited to one or two references to specific behavior the person performs. Social groups, such as classes, ethnic groups, political parties or nation states, are not naturally constructed by the sequential thinker. To the degree such categories are attended to when presented, they are not well understood. The part is confused with the whole. As a result, the features of the group as a whole are understood by reference to the particular features of a present or remembered individual member or symbol of the group. Intangibles, dynamic forces and abstractions are not objects of sequential thought.

The sequential thinker does not really comprehend the more remote domain of politics. S/he has little sense of the dimension of states, the nature of political hierarchies or the importance of abstract concerns. Contact with the political domain depends on direct exposure through immediate experience or as mediated by television. The focus will be on the concrete sequence of unfolding events. The sequences are not related to one another, each is an island of specific knowledge unto itself. The time of politics is a passing present with little causal analysis projecting into the past or the future. Rather the current events are tracked and their sequence sometimes remembered later. Although the sequential thinker does not normally think about politics, groups or hierarchies, they are often presented in the environment and understood in sequential terms. Thus, groups and states are confused with representative individuals, leaders or symbols. Hierarchies are reduced to the ability of one person to tell another what to do.

The evaluative activity of the sequential thinker consists of feeling and needing. The orienting questions are: What does this feel like? Do I want this to happen? Embedded in present experience or cued by memory, this evaluation depends on sensory experience (e.g., pain or pleasure). These sensed emotions or reactions are experienced as an inextricable aspect of the observed sequence of events in which they are evoked. (In this regard, subjective evaluation and objective definition are not well distinguished.) The resulting evaluations are linked to concrete events and do not generalize except through the process of sequential (and often distorting) matching of present events and remembered ones. These evaluations and the internal dispositions they create are quite mutable. As experience unfolds or new experience enters, old evaluative associations (except where learning trials are traumatic) are readily reconstituted.

Based on the individual's direct experience of feelings and needs as they are evoked in the course of events, sequential evaluations are quite egocentric. Social influences do, however, enter in important ways. This is true in several respects. First, the sequential thinker's behavior may be coordinated with that of others through existing reinforcement structures in the social environment. Second, the sequential thinker may unwittingly internalize the expressed feelings and reactions of others. This reflects the confusion of categories and of subject and object characteristic of sequential thought. When observed in the course of events, another's feelings or wants come to be understood as attributes of the

event itself. The feelings now associated with the event are then matched with and evoke one's own. The result is the appearance of an empathic response, one which is produced by the confusion of another's feelings with one's own. Third, sequential evaluations may be affected by labeling. The terms good and bad, as used and reinforced by other people, may acquire a reward value of their own and when attached to events by others may affect the sequential thinker's own evaluations.

The sequential thinker evaluates the world in a simple, largely egocentric and fluid fashion. Despite these limitations, there are circumstances where this is sufficient to enable the individual to negotiate the demands of day to day experience. This is particularly true in a social world constituted largely of habitual face-to-face exchange where novelty is rare and choices are few. Sequential evaluation is also adaptive to the extent to which the organization of social action reflects the emotional life of the sequential thinker and thus allows for the spontaneous expression of feelings of joy, frustration and anger. To the extent that social conditions demand self-control of feelings and needs, attention to the wants of others, consistent evaluation of objects and people over time, or the evaluation of remote and abstract objects, then sequential evaluation will not prove adaptive and pressures for development will increase.

LINEAR THOUGHT. Linear thinkers analyze the sequence of activity they observe. They focus on specific actions and then place one in relation to the other. Three kinds of questions guide their intellectual activity: (1) Regarding active relationships: What was the cause of an observed effect or what future effect will an observed cause produce? (2) Regarding categorical identity: What group of actions produces the same effect or is the result of the same cause? (2) Regarding standards: What is the sequence of actions which should take place? The answers to these questions are found with equal ease through one's own experience or another's report of experience.

Reasoning in this manner, linear thinkers are anchored in the immediate present, but can readily build on this to construct a more extensive universe. Through causal analysis, they can go beyond present activity to the past and future and consider remote actors and actions. Despite its power, linear reasoning remains grounded in experience and retains its concreteness. As a result, linear analysis is powerfully guided by the quality of the individual's experience or the specific information others provide (leading to agenda setting effects). Within these limits, the linear thinker readily generalizes from specific experience. Action relations are assumed to hold across the specific actors performing the act. Indeed, those relations are understood as concrete regulations or laws. Additionally, the linear thinker readily constructs simple categorical and hierarchical relationships based on the observation of the effective qualities of actors and acts.

For the linear thinker, the social world is constituted by actions which are in regular relationship to one another. These actions are extensive, an action is always understood as a cause or effect of another action. However, in the analysis, the tendency is to be satisfied with the identification of a single cause or

effect. In this context, individuals are conceived as they are related to action. As categorical entities, they are defined by the set of things they do or have done to them. In addition to concrete action, this set may include unobserved causes or effects of actions such as feelings, beliefs and intentions. Alternatively, individuals may be defined by their membership in groups. Groups are defined as categorical entities which include actors who are identical by virtue of the action (ritual), physical appearance, origin (common parentage) and territory they share in common.

Politics is an extension of this world. It is thus concrete and active; an extended stage with actors and groups, each pushing in their own direction with more or less power to direct the behavior of others. It is an arena of alliance, conflict and subordination. Its constituent actions are differentiated largely by the labels others provide or their association with what others define to be governmental institutions. These actions are causally and categorically linked. In this manner, simple hierarchies in which the more powerful dictate to the less powerful are recognized and particular groups are identified. Politics is thus bound by a kind of social necessity or lawfulness. This said, the understanding crafted by the linear thinker is still fragmentary. It centers around pockets of observed or reported action. Where a set of facts or claims are not experienced in connection with one another or their relationship is not expressly discussed by others, no subjective connections will be constructed. Additionally, there is little understanding of the collective or intersubjective quality of political life.

An expression of the structure of linear thought, linear evaluation consists of wanting and liking. This involves an active, unidirectional link between the action or actor to be evaluated and another action or actor which has already been evaluated. The questions posed are: How good, likable or desirable is the action or actor? Is the action correct? The resulting evaluations are abstracted from the concrete and immediate flow of events and then are applied as a standard for subsequent judgment. They are therefore more stable and enduring than those of the sequential thinker.

Linear evaluation established a unidirectional relationship between an evaluated action and the one being evaluated. One or the other is thus subordinated to and thereby become part of the other. The evaluative relationship may then be generalized to the other actions which are categorically linked to one another. Thus, when a liked actor performs an action, that action becomes subordinated to the actor (part of the categorical definition of the actor). As a result, the evaluation of the actor generalizes to the action and the action itself is liked. Alternatively, when a disliked action is performed on an actor, the action again becomes part of the category of the actor. In this instance, the evaluation of the action will generalize to the actor and perhaps through this to an evaluation of that actor's own action. (Here we have the structural underpinnings of the observed phenomena of cognitive consistency (Heider, 1958) and dissonance (Abelson, et al., 1968). One result of this kind of categorically mediated evaluation is the tendency to form univalent judgments in which the entity evaluated is considered to be either all good or all bad. This also creates an

avenue whereby social identifications and evaluations may powerfully affect the linear thinker's likes and dislikes.

Linear evaluation also includes a consideration of how actions should be linked to one another. The linear thinker's observation of how actions are recurrently related lead to the construction of a conceptual relationship among them (in other terminology, a schema is created). This not only creates an expectation, but also a standard for the evaluation of subsequent experience. Thus an orienting question also asked by the linear thinker is, "Is this sequence of actions or relationship among actions normal and/or correct?" Such standards are in part the result of personal observation, but they are also very powerfully determined by social convention and authoritative dictate. Culture defines what is desirable and social structure determines what is regular or recurring. In the understanding of the linear thinker, the two, the desirable and the normal, are interchangeable and both come to be subjectively valued.

The linear thinker's evaluative activity provides more flexible orientation than that of the sequential thinker. It enables him or her to make clear, consistent and enduring evaluations of actions and actors. It also allows for a reflection on one's own feelings and reactions and, through this, to consider them relative to one another. This in turn facilitates the self-control required for more effective and acceptable participation in social life. The linear thinker's abilities prove particularly adaptive in a homogeneous and traditional social world in which the place and value of actors and actions are consistently and coherently defined. Linear evaluation functions less well in a heterogeneous environment where there are varieties of definition regarding what is acceptable or desirable practice. Similarly, this kind of evaluative activity is ill-suited to social environments in which there is rapid cultural change with the ensuing denial of the familiar. To the extent that more cosmopolitan and modern environments undermine the authority of tradition and require individuals to make and justify choices among standard preferences, they create demands which simply cannot be met by the linear thinker. The result will be either cognitive development or social withdrawal and retreat.

SYSTEMATIC THOUGHT. The systematic thinker makes sense of events by juxtaposing the relationships among actions and beliefs. A number of real interactions or expressed propositions and preferences are considered simultaneously. These are placed relative to one another in a subjectively constructed system of relationships. The systematic thinker analyzes a situation in terms of its component aspects and, at the same time, defines those aspects with regard to the system of which they are a part. Reasoning in this manner, the systematic thinker can induce the general from the particular, define those generalities in their own abstract terms and then use them as a basis for identifying, redefining or imagining particular objective interactions or subjective propositions. The intellectual activity of the systematic thinker is oriented by the following questions:

A) When considering objective phenomena.

1) What are the basic or general laws which govern the interactive relationships which may occur?
2) Under what conditions, real and hypothetical, will a given interactive relationship hold?
3) What role does a given type of activity play in a system? What function does it serve?

B) When considering subjective phenomena.

1) What is the general principle upon which the validity of a particular proposition depends?
2) What is subjective or cultural meaning of particular proposition or statement?
3) What role does a particular claim or belief play in maintaining an individual's personality or a society's culture?

The systematic thinker answers these questions in two ways. On the one hand, s/he relies on observation, both his or her own and others'. Given the nature of systematic thought, this reliance on observation incorporates considerations of chance, circumstance, interactive effects and the perspective of the observer. On the other hand, the systematic thinker addresses the foregoing questions through reflection and argument. Here the concern revolves around issues of procedure (deductive logic, fairness, etc.) and coherence (noncontradiction, relevance, etc.).

The social world constructed by the systematic thinker is an integrated one in which present action and events are interpreted in a larger context of the meanings and values of the acting subject or regulating community. Individuals are seen as thinkers who through the subjective construction of reciprocal relations among actions create their own meaning and value. In this light, individuals are also viewed as a personalities which provide a more or less coherent integration of the individual's actions and reactions. Any specific action they take or statement they make must be interpreted in this broader subjective context. Communities are seen in similar terms, as a source of meaning and organization in social life. This naturally leads the systematic thinker to consider political matters.

Systematic thinkers naturally construct an elaborated conception of politics, one which may go well beyond the particulars of their own or others experience and information. They begin with an extended frame of reference and then place present and immediate events in that context and self-consciously interpret them accordingly. Thus, the interaction among political actors and forces are considered with reference to the system of political exchange in which that interaction occurs. Political action is understood with reference to its underlying social organization. This suggests that a given act must be understood in context and thus seen to possibly be the result of multiple causes and may have multiple effects. This organization has functional requisites and a structure. The latter consists of a complex hierarchy of interdependent orders and levels within orders. At the same time, there is a recognition that the organization of political exchange depends on a culture which defines and thereby helps coordinate interaction. This culture is understood to have its own integrity and coherence.

Systematic evaluation is a matter of self-conscious judgment in which the evaluator is aware of the reflective and interpretative dimensions of his or her evaluative activity. These judgments are made either with reference to some standard of systemic functioning or by application of rules regarding the relationship between systems. Thus, systematic evaluation is oriented by a concern to maintaining the coherence or integrity of persons (themselves or others) or societies (as organizations or cultures). Here judgment revolves around such concerns as meaningfulness, coherence, and function. Evaluation is also guided by general principles for adjudicating the potential conflicts and contradictions which may exist among the aims and desires either of a single individual, between individuals or between the individual and the collective. Here concern focuses on interdependence, cooperation, power, etc. Particular concrete interactions, propositions or preferences or social norms are interpreted and judged accordingly.

The systematic thinker naturally distinguishes between two levels of evaluation, one of social preference and the other of moral judgment. The first reflects specific concrete relations expressed in an individual's or group's preferences. A number of these may be considered simultaneously and therefore the systematic thinker may readily recognize both positive and negative aspects of a given action or actor. The second level involves an interpretation and judgment of these specific relations with reference to the overhearing requirements of systemic functioning or inter-systemic relationships. Examples of concerns voiced at this level include the integrity of individuals or communities, the openness and good sense of argument, and the obligation of individuals to care for one another.

At the level of more concrete and specific considerations, the systematic thinker can identify various systems of interaction and of belief. This may be a matter of recognizing different ways of life in different societies or different patterns of exchange in different subsystems (e.g. the economy or the family) of the same society. The different systems may be understood to have different functional requisites and hence produce and require substantively different standards for evaluation. Judgment is conducted accordingly, leading to domain specific, relativistic evaluations. This said, basic moral values and considerations which speak to the general qualities of systems are understood to apply universally.

Proceeding in this manner, the evaluations of the systematic thinker are much more independent of specific experience and social context than those of the linear thinker. Particular events and the consequences they produce are defined and judged with reference to a preexisting frame of reference. Similarly, the specific preferences others voice or the shared values that a group asserts are considered and evaluated in light of more abstract and general concerns and independently of the determinations of the immediate events and social direction. These considerations, however, do not extend to a self-conscious analysis and evaluation of the basic assumptions regarding systems and their functioning

which orient systematic thought. Therefore there is little appreciation of the relativity of these assumptions as the products either of subjectivity or culture.

RESEARCH METHOD

The research reported here is part of a larger project. To provide the requisite context, I will briefly discuss the project and then describe the aspect reported here in greater detail. The larger project of which the present research is a part was designed with several aims in mind. The first and most central was the testing of three hypotheses regarding the structural developmental analysis of political evaluation. These were: (1) that an individual's evaluation of different phenomena reflected a single underlying structure (sequential, linear or systematic), (2) that different individuals would evaluate social and political phenomena in structural different ways, (3) that there was a chronological order to the development of evaluative activity from sequential through linear to systematic. In addition, an attempt was made to juxtapose the results of the structural developmental analysis of individual's political evaluation with an assessment of their reasoning based on alternative theories of political ideology or social evaluation. To this end, subject's evaluations were also assessed according to (a) the levels of political conceptualization measure developed by Philip Converse (1964), (b) levels of cognitive complexity measure reintroduced by Philip Tetlock (1983; Harvey, Hunt & Schroeder, 1961), and (c) stages of moral development measure developed by Lawrence Kohlberg. The research has been conducted over extending from August of 1991 to December of 1992.

SUBJECT POPULATION. Two populations were studied. Each reflects certain specific aims of the overall study. To examine the development of individuals' political evaluations, one population was stratified by age. It included 78 students. Twelve students were drawn randomly from the sixth, eighth, tenth and twelfth grades of a small, upper middle class school system in southern California. An additional thirty 3rd and 4th year students from a neighboring university participated. To provide evidence with regard to the nature and variety of adult political evaluations, the second population was stratified according to factors which might cause or reflect differences in development. This second population consisted of 90 adults who lived in Orange County, California. One-third of this group had a high school education or less, earned less than $20,000 a year and had little or no responsibility for others on the job; another third had some college education, earned between $25,000 and $35,000 and did exercise some on the job control; and a final third had at least some postgraduate education, earned more than $60,000 and had job which gave them considerable control over other people.

METHOD. The research methods employed were essentially the same with two different populations. In all cases, the subjects were interviewed individually at length. The interviews were taped and then transcribed. Each interview consists of several different parts.

1) Subjects were surveyed using close-ended and short answer questions in order to collect basic demographic data (on age, ethnicity, occupation,

education, etc.). They were also asked about their political ideology (on a continuum from very liberal to very conservative), their partisan identification, the amount and type of political participation in which they have been involved, and the significance of identification they have with social groups (e.g., family, religious, social, ethnic or national groups).

2) Using standard National Election Study procedures, subjects were asked to state and briefly explain their evaluations of the two major political parties and the two (or three, when Ross Perot was a factor) major presidential candidates. Subjects were later scored according to techniques developed by Philip Converse (1964) and commonly used in current public opinion research. The aim here is to juxtapose these results with those of part four in order to determine the extent to which this approach offers a rather uncertain measure of rhetoric rather than a reliable insight into values and evaluation.

3) Subjects were asked two questions, one regarding the exhibition of controversial photographs (examined in depth in part four) and one regarding current independence movements in Europe and elsewhere. In each instance, the subject was asked to state his or her view and explain it. No additional probing was done. The subject's responses were then coded for their cognitive complexity.

4) Subjects were interviewed in-depth on three topics, one social and two political. The social issue poses a problem in which the subject identifies a significant other and then is asked whether or not they would steal in order to save that other person's life. The problem here revolves around questions regarding the value of other persons and of social convention. One of the political issues addresses questions of individual freedom and community integrity. With the adult population, this is examined in the context of the controversial homoerotic photography of Robert Mapplethorpe and the attempt of one midwestern city to close a public display of his work. With the school age population, the same basic situation is posed by an exhibit which defiles the American flag is discussed rather than the homoerotic art. In both cases, subjects were asked first to state whether or not they want the work to be exhibited and then to justify their choice. The other political issue focuses on foreign policy, more specifically when it would be desirable to have the United States interfere with activities of other nation-states. The point of departure for this interview is a discussion of the Gulf War. Subjects' evaluation of all three issues was probed extensively. This includes the use of follow-up questions directly probing expressed values and associated justifications and the use of alternative scenarios to further clarify and challenge the subject's values. Subjects' evaluations of each topic was then scored according to the type of evaluation, sequential, linear or systematic, employed.

5) Subjects were presented with an ethical dilemma which juxtaposes the right to property and the right to life. Developed by Lawrence Kohlberg for the assessment of moral reasoning, the dilemma requires subjects to decide what a fictitious character ought to do when saving a loved one's life requires breaking

the law. Subject's responses were coded both according to Kohlberg's coding scheme and my own.

The interview takes approximately two and one-half hours and was conducted in two sessions. Whereas all subjects were asked to respond to parts 1, 2 and 3 in the same sequence, the order of the issues addressed in parts 4 and 5 was randomly varied from interview to interview. As suggested, parts 2, 3, and 5 were coded according to the procedures stipulated by researchers adopting the theoretical approach being explored. Parts 4 and 5 were coded according to a scheme developed in light of the analysis of political evaluation presented here.

The interviews were conducted by myself and five research assistants. Parts 4 and 5 of the interview are open-ended and quasi-clinical. The conduct and subsequent coding of these parts of the interview are demanding exercises in the structural exploration of and subsequent interpretation of a subject's reasoning. Consequently, both interviewing and coding required extensive training. Each of the assistants were involved in a lengthy process which involved the reading and discussion of relevant theoretical materials and the conduct of three to six successive practice interviews. When each interview was completed, it was transcribed and then closely analyzed and critiqued before the next was conducted. The purpose was to train interviewers (1) to elicit sufficiently rich responses to allow for later structural interpretation and (2) to introduce concerns consistent with typical of each structure of evaluation (sequential, linear and systematic). The latter procedure was used as part of the test of the consistency of subjects' evaluative reasoning. For coding purposes, each topic was considered separately and, within topic, two to three sections were distinguished. Each section of each topic was then analyzed by two coders who were blind both to the identity of the interviewee and to each other's coding. To guide coding, a manual was developed which elaborated how each mode of evaluation would structure the definition and evaluation of the concerns addressed in each section of the in-depth interviews.

The research reported here pertains only to the second subject population which included adults only. The data reported are restricted to the core investigation of the structure of political evaluations evidenced in the course of the three interviews dealing with a personal issues, a domestic political issue and an international conflict. The interviews and the manner in which they were coded are described below. It should be noted that the interviews are being coded twice: once toward a global assessment of the entire interview and once in which the interviews are broken into several sections which are coded separately. Only the first method of coding is presented here.

The personal controversy interview and coding. The interview on the personal controversy focuses on the relationship between one's own desires, those of another and social norms and conventions. It begins by asking the subject to identify a person who is close and important to them. Typical choices include family members and best friends. The subject was then asked to imagine a situation in which that significant other is dying of a disease. The disease is curable, but the necessary drug treatment is extremely expensive, well beyond the

financial means of the dying other or the subject. In the first part of the interview, the subject is then asked whether s/he would steal to save the other's life. The subject is then asked why s/he would or would not do so. The reasons offered are further probed by asking the subject to explain why those reasons are compelling.

In the second part of the interview, the subject's evaluation is examined by presenting contrary issues and scenarios which emphasize considerations which are prominent at each of the three stages of development. For example, if the subject decided to steal the drug, scenarios would be presented which might lead to a change of mind. To emphasize sequential considerations, the subject is asked if s/he would steal knowing that s/he would be caught and go to prison and suffer in certain specific ways. Alternatively, the subject would be asked if s/he would steal if she did not really like the other or got along badly with them. To emphasize linear concerns, the subject is asked if they would steal even though stealing is a bad thing. Good people do not steal. Alternatively, if the subject emphasizes conventional personal obligation, s/he is asked what s/he would do with a some one where the obligations may be less (e.g., a stranger).
Finally to introduce systematic considerations, the subject is asked to consider the nature and role of the conventions themselves. Here a demand for a second-order evaluation is created.

The global coding of the interview is as follow:

SEQUENTIAL. The focus is on sequences, unfolding series of events, and the feelings (e.g., pleasures and satisfactions) associated with them. Evaluations focus on chains of events and are determined by the feelings those events bring with them. These feelings and the evaluations which follow them are sensory, concrete and egocentric. Thus, the sequential thinker will not steal because this will lead to running and being shot at and being caught and going to prison. Alternatively, s/he may act to save the other because "I love him" but this love is later explained as the result of the specific pleasurable things he does for the subject. Moreover, when asked if the subject would help if the other is not being nice, the subject is clear that s/he would not steal. This also reflects how specific evaluations are to the context of a sequence. The sequential nature of the evaluation is also reflected in the repair of a bad sequence. Thus upon considering stealing was bad because it had led to some painful end, the sequential thinker will repair the problem completely by simply returning events to their original position. For example, s/he would return the drug. Evaluations may reflect an empathic confusion of the other's feelings, the attributes of the event and one's own feelings in the event. Thus the sequential thinker may steal for the other because they are focusing on the pain or fear of the dying other and this becomes an attribute of the event and thus a feeling the sequential thinker has when considering the event. In this sense, the judgment is not strictly egocentric, but remains concrete and oriented by immediate feelings and needs.

LINEAR. The focus is on specific actors and concrete observable actions which are evaluated as desirable, good or correct. Thus the linear thinker considers the qualities of the action or actor themselves. Evaluation is based on the linear relationship of the action/actor in question to other actions or actors. This may be an active or categorical relationship. In the case of active relationship, actions are evaluated in terms of their causes or consequences and actors are evaluated in terms of what they do or have done to them. Thus, the action of stealing may be deemed good because it saves someone who is valued or because it is motivated by a good intention. The action may be evaluated negatively because it does harm to the owner of the drug, it will have the effect of landing the subject in prison, or it will produce bad feelings, e.g., guilt, in oneself. The other person may be

valued because of what they do for the subject or anyone else. Thus, the subject values his friend because she helps others in the world. In the case of categorical relationships, actions and actors are evaluated by the category to which they belong. Thus, one may suggest I am a good person which means I do good things in which case my decision to steal must be good. In addition, the subject may introduce moral considerations expressly or implicitly. In both instances, reference is to correct specific behavior (chain of concrete action) as determined by authoritative decree, cultural convention, role requirements or normal practice. Thus, the subject may decide not to steal because stealing is bad, or breaking the law is bad. Alternatively, they may decide to steal because it is correct for a friend to help a friend in need. These conventions cannot be justified, they are given. Following conventions is explained in terms of outcomes. To violate a convention is bad because it ends in punishment (you will go to jail), negative self-image (you will think of yourself as a bad person) or the revenge of fate (you will probably end up getting hurt in some way later). Might worry about what is fair or just, but this is equated with doing what is correct. At best, it is equated with concrete procedure (an eye for an eye, taking turns, etc.)

SYSTEMATIC. The focus is on the exchange among actors and the behavioral conventions which are relevant. In this context, the stealing is not simply a matter of taking something. Rather, it is taking something which both involves depriving someone of property and at the same time helping someone in need. Moreover there is a consideration of the conventional responsibilities (role) and behavioral norms (e.g. culturally and legally correct behavior). Thus, the act of stealing may be legally prohibited and at the same time culturally permissible under the circumstances. At this first level of consideration, actions may have multiple effects and be assessed complexly - that is as having positive and negative ramifications. At the second level, the exchange and conventions are judged by their systemic consequences. Thus, the act of stealing or the failure to steal may be evaluated in terms of the integrity or coherence of the subject's personality and self-definition. Alternatively, the needs of the community, as a organization and regulator of social life, might be invoked. In this context, the theft may be judged by its implications for the functioning of the community as cultural as well as social system. The law governing theft may be judged similarly. These pragmatic considerations may be complemented by moral ones which revolve around the relations between systems - either at the same level (individual to individual) or at different levels (individual to community). Here general principles are evoked and then applied deductively to the judgment of exchanges and conventions. For example, a principle of human sociality and mutual obligation between individuals may be invoked and stealing, the deprivation of property and the breaking of the law legitimated accordingly. In a different vein, a principle of the subordination of the individual to the community may be asserted and the breaking of law to save an individual regarded as illegitimate.

The community-individual conflict interview and coding. The interview on community-individual relations presents a domestic political conflict between the director of a city museum and an artist on the one hand and the local community and its leadership on the other. To begin, there is a brief presentation of the controversy which arose in Cincinnati, Ohio over the exhibition of photographs by Robert Mapplethorpe. Some of the photographs were sexually explicit and homoerotic. The city of Cincinnati was characterized as unusually homogeneous and conservative in outlook. There was a public outcry and the city council demanded that the offending photographs be removed. The director of the museum disagreed and argued that this was part of Mapplethorpe's art and deserved to shown. The subject was then asked to decide whether the photographs should be shown or not. S/he was then asked to explain why and justify the reasons given.

To further probe, the subject's reasoning a number of modifications and additions were made to the initial story. In each case an attempt was made to confront the subject with contrary considerations reflecting different types of evaluation. For example, if the subject wants the photographs to be shown, s/he is asked what they would do if they personally saw the pictures and thought them disgusting and ugly to emphasize sequential concerns. To focus on linear considerations, the evaluation of a group of respected art critics and clergy who judge the photographs to be obscene and of little artistic value is introduced. To emphasize systematic concerns, the venue is changed to the Hispanic Santa Ana, California and the exhibition is of racist art which presents Hispanics in demeaning ways. In each instance, the subject is asked if the photographs should be shown and justify holding to or changing the initial judgment.

The global coding of the interview is as follows:

SEQUENTIAL. The focus is on the sequence of unfolding events, the story of Mapplethorpe as told. The sequence presented may evoke feelings as it involves the subject directly in the story, as global events are matched (in sequential fashion) to the subject's own remembered experience, or as the subject empathizes with the observed or imagined feelings of characters in the story (through a confusion of other's feeling, attributes of the events and one's own response to the event). Evaluations thus focus on the immediate and present and are egocentric and changeable. Thus the exhibition of the pictures may be negatively valued because it is followed by all those people being upset or their bad feeling may follow with the director himself also feeling hurt. Alternatively, the exhibition may be negatively valued if others reward the subject leading him/her to feel good. The subject may want the pictures shown if s/he has seen them and judged them found them beautiful or pleasurable. Comparative judgment of several alternative courses of action is difficult. There is a tendency to remain anchored in a single sequence at a time and evaluate it in terms of the associated feelings. The sequential thinker will not understand the community per se and value it not at all. Additionally, authoritative judgments of experts or leaders will have little effect unless this engages associations with a sequence of reward or punishment. Similarly, the quality of the relationship among the players will not be considered or evaluations made in this light.

LINEAR. The focus is on specific actions and actors, both observed or presented or related observable ones which are remote in space or time. The actions and actors are evaluated in terms of their active or categorical links to actions and actors already evaluated. This leads to the determination of whether the actions and actors are good, likable or desirable. An example of the active linkages that lead to evaluation is negative evaluation of the exhibition of the photographs because it produces causes people to copy the action depicted which in turn causes them to hurt themselves or others. Alternatively the exhibition may be judged good because viewing the photographs will lead others to have positive attitudes toward homosexuals and be nicer to them. An example of categorical linkages that lead to evaluation is the notion that the exhibition is good because it has been chosen by the director (an expert who by definition makes good choices) or because it is the work of a good photographer. The unpopular exhibition may be negatively valued because it helps good people (homosexuals) but an exhibition which helps bad people (e.g., racists) may be negatively valued. Alternatively, the exhibition may be negatively evaluated because the action depicted falls into a class of actions, homosexual acts, which are already defined as negative. These judgments tend to be global and univalent. As a result, in the last example, not only will the photographs be judged undesirable because the depict a bad act, but they will also be judged artistically worthless or unattractive.

Notions of correct behavior may also be introduced. These might include the notion that artists have the right to express themselves, that people have the right to choose what they see, that the decision regarding exhibitions is the proper preserve a museum director, that people ought to be

exposed to new things, etc. Cultural mores, social traditions, moral imperatives and law all enter in here on an equal footing as conventions regarding correct performance of roles and rituals. In each instance, the exhibition of the photographs would be evaluated as correct or good to the degree it conformed to the behavioral convention in question.

The linear thinker can make sense of groups and of hierarchy and will evaluate people and action by their social location. The conflict between the individual and the group will be judged in favor of one or another depending how each specific person or group is valued.

Because they focus on specific action relations, the linear thinker's judgments may be altered by introducing alternative foci. If the linear thinker is initially considering the good of the artist, the agenda can be redefined by the interviewer focusing on the good of the viewers leading to different judgment. Alternatively, judgments can be altered by changing the focus from one relevant cultural norm (e.g. freedom of expression) to another (e.g. right of community to maintain its tradition). The conflict between norms thus introduced is confusing for the linear thinker unless the cultural or accepted authority provides specific direction.

SYSTEMATIC. The focus is on the various exchanges in light of the multi-sided relationships between the director, the artist, the city council and the public. At the same time, there is a clear recognition of the place and needs of the community as the system which both regulates social exchange and defines social meaning and value. The preferences of the various players and particular social conventions are regarded as first order concerns, ones which have significance, but must be judged in light of second order considerations. Thus, the artist's desire to show his photographs and even his more general invocation of the American convention of freedom of expression will be considered and evaluated in terms of the broader consequences for the functioning of the artist or the community. This may lead to an evaluation based on a prior understanding of the functional requirements of individuals as thinkers and personalities or to one based on functional requirements of communities as regulators of social exchange. The latter may lead to very different judgments of the same activity enacted in different systemic contexts. Thus, the exhibition of photographs may be deemed appropriate and functional in the context of a multicultural progressive city with a significant homosexual population, but unnecessary and destructive in homogeneous, traditional city.

The systematic thinker may also invoke moral imperatives regarding the relationship between systems. Specific exchanges and social conventions will be judged accordingly. The problem presented in the interview is particularly difficult because it involves nested systems and is readily cast in terms of the relationship between the individual citizen as a personality and the state as a community of citizens. The systematic thinker will often attempt to allow each system its integrity and to meet its needs. However, this is difficult and will often devolve in a tendency to focus on one level as systemic (and thus the source of meaning and value) and the other as derivative. Examples of this are classic liberal (individual as system) or conservative (community as system) visions of the relationship between the individual and the state. At best, the systematic will invoke imperatives that both the community and the individual be respected and give examples of how to accomplish each with out integrating the various principles enumerated.

The Gulf War interview and coding. The interview on the American-Iraq war of 1991 has three parts.

Part one . The subject is asked what the United States gained from the war and what the costs had been. S/he is then asked to consider costs and benefits relative to one another.

Part two . The focus here is on economic threats. Brief examples are presented of how Japanese unfair trade practices or Arab manipulation of oil availability might have disastrous consequences for the American standard of living. The subject is asked if such economic attack constitute a good reason to go to war and then to explain why this is the case. The subject's decision is then

probed by presenting contrary scenarios in which value considerations at each level of reasoning were presented. For example, if the subject decides that war is warranted, the interviewer raises contrary sequential concerns suggesting that the economic threat would have no effect on the subject personally or alternatively the decision to go to war might cost the subject personally. Contrary linear concerns are then raised such as the fact that the economic attack would have little effect on friends, family or ethnic group or later that going to war might have considerable costs for them. Finally contrary systematic concerns are raised by suggesting that although the American standard of living would be affected, the quality of American political and cultural life would not or alternatively that the quality of American life would be adversely affected by the act of going to war. In each instance, the subject's decision to maintain or change his/her decision is probed by follow-up questions asking why the decision was made.

Part three . The focus turns from a response to an economic threat to a consideration of political principles as a rationale for going to war. Brief examples are given about countries who engage in practices (e.g., the Nazi practice of genocide or South African apartheid) which are contrary to American political principles. The subject is asked if war is warranted in such cases and to explain his/her choice. Again contrary concerns at each level of evaluation are introduced to further probe the subject's thinking. For example, if the subject decides against American involvement, the interviewer raises sequential concerns by suggesting that the discriminatory practices abroad may have a direct effect on the subject by leading to personal attack. Linear concerns are then raised by suggesting that the discriminatory practices affect people such as the subject (his/her racial, religious, ethnic background) both in the foreign country and, if necessary, in the U.S. Finally systematic considerations are introduced by the suggestion that the condoning of abhorrent practice undermines our own values. In each instance, the subject's decision to maintain or change his/her decision is probed by follow-up questions asking why the decision was made.

The global coding of the interview is as follows:

SEQUENTIAL. The focus is on specific isolated concrete sequences of unfolding events presented on television or vividly narrated by others which are associated with pleasurable or unpleasurable sensations or feelings. Insofar as the sequential thinker is not directly involved, evaluation will occur if these concrete sequences engage the sequential thinker by evoking a other-event-self confusion such that there is an empathic feeling for the other in the sequence. Thus being able to observe an American soldier's joy at hitting a target or a Kuwaiti's pain and anger for the bombing of his house may evoke the same feeling in the sequential observer. The sequential thinker will also evaluate a sequence if events are matched (often in a partial and distoriting) with a remembered events in a sequence which was rewarding in the past. For example, the sequential thinker may here that Iraq is bullying Kuwait to do something and this evokes a memory of a sequence in which the subject remembers being bullied, fuses the two sequences and then evaluates the international sequence accordingly. Evaluations may also be voiced, if this expression is associated with pleasurable sequences. For example, if others reward the subject for condemning the Iraqis, then the subject will do so even if the actor and action have no meaning for him/her.

LINEAR. The focus is on action and actors as discrete units of analysis to be evaluated as good, desirable or correct. Thus, the linear thinker's evaluations readily and consistently focus on specific actors (e.g. the United States, Iraq, or the Israelis) and concrete actions (e.g., the decision to go to war, the bombing of Iraq, the bring together of allies, the invasion of Kuwait, the particular statements a leader makes). Actions and actors such as these are evaluated in three ways. First, by the already evaluated causes and outcomes with which they are associated. Thus the bombing of Iraq is considered a good thing because it insures we get oil which is a good thing. Alternatively, Kuwait is a bad country because it was easily overrun and being easily overrun is bad. Second, actions and actors are evaluated by their categorical identification. For example the American attack on Iraq is a good thing because it was done by the United States which is a good country. Similarly, the Iraqi attack on Kuwait was a bad thing because it was done by Iraq which is a bad country. Kuwait is a good country because it is positively associated with the United States which is a good country. In this way, actions and actors are evaluated globally - that is they have an overall evaluation. This overall evaluation is unidimensional and will be sustained even in the face of specific contrary evidence. This will involve the reinterpretation, denial or devaluation of the evidence. For example, the U.S. may be observed to engage in a bad act (aggressing against another nation), but this act may be redefined as a good act (it helped someone) or its connection to the U.S. reduced (the U.S. was forced to do it). Finally, actions are evaluated by the degree to which they conform to concrete behavioral norms. For example, the American decision to help weak Kuwait fight strong Iraq is good or correct because one is suppose to help the weak against the strong.

SYSTEMATIC. The focus is on interactions, conventions of specific behavior and cultural values and definitions. Examples would include the attempt of Iraq to assert its leadership in the Middle East, the problems of defining the national status of Kuwait, the appropriateness of American involvement in the Iraqi-Kuwaiti conflict, the nature of the exchange between the U.S. and Iraq or the relationship between Israel and the U.S. On the one hand, these are evaluated by examining them in relation to the functioning of political systems. For example, the systematic thinker might evaluate the Iraqi-Kuwaiti relationship in light of the functioning of the system of relationships in the Middle East. The assertion of Iraqi power could be judged to have a disintegrating effect on the stability of the area and be judged negatively. Alternatively, s/he might evaluate American involvement in terms of its consequences for the functioning of the American system. The involvement in war might be seen as contributing to a culture of violence and judged negatively. On the other hand, interactions and conventions may be judged by application of general principles of how systems ought to interrelate. Thus, the idea of assassinating Saddam Hussein might be recognized to as an effective military option, but ultimately condemned because it does not conform to a principle of international exchange based on free and open negotiation oriented to establishing cooperation.

RESULTS

The following report of results is preliminary. Because of some unexpected delays associated with the transcription of interviews, only 42 of the cases from the adult sample have been fully transcribed and coded. The 42 subjects are drawn in roughly equal proportion from the three social categories. All interviews were divided according to topic, personal controversy, domestic political issue or international conflict and each section was scored separately by two coders blind both to the other's score and the identity of the interviewee. Inter-coder reliability after the training procedure was 82%. In the 23 (out of 126) cases of disagreement, the coders met and an agreement was reached.

The theory developed here suggests two hypotheses: (1) that there is a general evaluative structure which underlies an individual's consideration of both

political and non-political phenomena, and (2) that different people's evaluations may be structured differently. To test the first hypothesis, subject's responses across the three interviews were examined. Thirty-two of the subjects, slightly less than 80%, responded to all three interviews in the same structurally determined way. This provides strong support for the claim that there is a single underlying structure which shapes how a person evaluates both personal and political events (domestic and international). The remaining subjects scored at the same level on two of the three interviews. For the other purposes of the study, these ten subjects were given a global score at this level. Keeping in mind the small number of cases, it is noteworthy that there was no particular pattern indicating that one of the interview topics typically produced higher or lower scores.

To test the hypothesis of individual differences, the overall scores of the 42 subjects were compared. Nine subjects were scored sequential, twenty-two were scored linear and eleven were scored systematic. This suggests that there are differences in the structure of individual's evaluative activity and that these differences are well captured by the typology presented here.

It is worth noting that there are alternative interpretations of these results which grow out of a social learning perspective. Although I have discussed these at some length elsewhere in connection with my work on reasoning and understanding (Rosenberg, 1988a, 1988b), I will comment on two briefly. One raises the issue of differential exposure to information and the other to differences in formal training (education). Neither explanation is particularly persuasive here. Exposure to relevant information hardly seems a factor which would meaningful differentiate adults speaking of their evaluation of a good friend or loved one and considering the opportunity to steal to prevent their death. Moreover it is highly unlikely that what ever differences might be imagined here would apply consistently across the very different matters raised by this personal issue, a domestic controversy and American involvement in the Gulf War such that subjects would respond to all three interviews in the same fashion.

The formal training issue is potentially more persuasive. It might be that those with similar educational background would use the same language and concepts to make sense of various issues. This explanation may be countered in two ways. First, the scoring of an interview does not revolve around the concepts employed or the language used by the subject. Rather, the attempt is made to evaluate the understanding of those concepts. Thus subjects may use the same concepts or language and be scored differently. Alternatively, subjects who have different training and exhibit clear differences in vocabulary may nonetheless think in the same way and be scored accordingly. Second and following on the first, the evidence suggests that this training argument is incorrect. In the present research there is only a very rough relationship between all three demographic characteristics (educational level, income and job responsibilities) and type of evaluation. In earlier research the matter is deal with directly. Evidence is presented which demonstrates that subjects who have virtually identical training (students in the same year at the same university with the same major in the

relevant area) score differently on the same task or interview (Rosenberg, 1987;1988a; 1988b).

CONCLUSION

I have adopted a developmental approach to the study of political reasoning and evaluation. This approach is based on three basic assumptions. These are: (1) reasoning and evaluation are subjectively structured activities; (2) through interaction with a structuring environment, the structure of an individual's reasoning and evaluation develops; (3) because the structure of environments vary, people reach different stages of development and therefore will reason and evaluate in fundamentally different ways. Adopting this approach, I defined three types of political reasoning and described the kind of evaluative activity associated with each. To test this, the preliminary results of empirical research on a population of 42 adults were reported. They provide strong support for the claims that (1) an individual's political evaluation has an underlying structure which determines his/her judgment of both political (domestic and foreign) and nonpolitical phenomena, and (2) different individuals may evaluate the same phenomena in structurally different ways. Furthermore, the results suggest that these structural differences in evaluation are well captured by the threefold typology of sequential, linear and systematic political reasoning.

Combined with other research on the development of political understanding, the present work on political evaluation has clear implications for both the study of individual behavior and the analysis of macrolevel phenomena such as political culture. At the level of the individual, the research suggests that different individuals expressing the same political opinions may be understanding and judging the issues in fundamentally different ways. Understanding these differences may be critical not only to the proper description of the opinions expressed but also to a proper understanding of the causes of the opinions, the conditions under which they are likely to change, the impact they will have on other opinions voiced and their effect on choices made. At the level of the collectivity, the research suggests that political theories of culture and institutions cannot assume that these collective entities simply shape individuals' choices and preferences or determine the meanings they construct or the ends they value. Instead, these theories must recognize that individuals actively construct their understanding of the world and the value of the purposes they pursue. Insofar as culture and institutions are realized through how individuals talk to and interact with one another, these large scale phenomena must be defined with reference to structural qualities of human agency. The suggestion was made here that this leads to social and political theory which recognizes that social interaction and discourse is dually structured, both by the thinking individual and the defining society. Specific analyses of political institutions and culture, both as they currently function and as they change over time, must be crafted accordingly.

Presidential Success and Failure in the Congressional Budget Process

Alan J Rosenblatt, *George Mason University*
James A. Thurber, *The American University*

Abstract

The debate over President Clinton's first budget raises many important questions regarding the assessment of presidential success and failure in the congressional budget process. How can we objectively measure the degree of success and failure? How can we create a consistent measure that allows comparison among different presidential budgets? What factors explain presidential success and failure in the congressional budget process? This paper explores several methodological difficulties in creating an index of presidential budget success and offers a plausible model for explaining variation in this index.

Perhaps the greatest test of presidential leadership is the battle of the budget. Likewise, this battle is the moment of definition for Congress's ability to set its own spending and revenue priorities. The budget is the tangible manifestation of public policy and the shape it ultimately takes is an ideal indicator for assessing who wins this annual policy battle. Decisions about the federal budget are at the heart of the relationship of the president and Congress. The allocation of funds to specific programs is an essential step toward the enactment of any policy. If the allocation matches the president's requests, then the president has attained some measure of success in the process. But is this the extent of a thorough evaluation? In this paper, we suggest that a program level analysis of success and failure is necessary, but not necessarily sufficient for identifying the degree of presidential success in the budget process.

The battle over President Clinton's first budget highlights many of the key questions confronting those who study the budget process (Thurber 1991a). The president requested several tax increases, policy changes in existing programs, and modifications to expected funding levels of existing programs. President Clinton did this at a time when his job approval ratings were at an all-time low and his disapproval ratings were unusually high. At the same time, the 103rd Congress is flush with 110 freshman House members, attempting to change the congressional power structure. To further complicate matters, there is a growing and vocal movement throughout the electorate, spearheaded by Ross Perot, demanding that the federal government address the federal deficit and debt; to resolve the severe fiscal problems facing this nation.

All of this takes place against a backdrop of severe budgetary and political constraints. Much of the budget is relatively uncontrollable, the president and the Congress have an increasingly smaller share of the budget that can be changed (Thurber 1992). Over 49% of the federal budget is paid out for entitlement programs. The amount of this payout is dependent upon the number of qualified people filing for benefits. As the economy falls, more people qualify. This creates a double threat to our fiscal integrity, for the people that qualify for government assistance are the same people who can no longer contribute taxes to the country's coffers.

The budgetary battles between Clinton and Congress leaves many Americans wondering how we can break the cycle of protracted conflict and deadlock. To many the budget process seems bogged down and the federal government seems incapable of breaking the gridlock, or as some have referred to the budget battles, "greedlock".

Influence and Success

The scope and size of the annual budget of the United States poses a dilemma for presidential and congressional scholars, as well as for the general public. How can we evaluate the political power and performance of the president and the Congress in the congressional budget process? When we compare the outcome of the final budget with the initial requests of the president, two questions come to mind. First, was the president successful? Second, did the president influence the outcome of the process?

If we were to believe the rhetoric from Washington, there is no difference between these two questions. The closer the outcome to the request the greater the level of presidential leadership. In politics, the word "leadership" has blurred the distinction between success and influence. One definition of presidential budgetary influence is the power of producing an effect or outcome that the president wants as opposed to some other competing position; the power of winning acceptance to proposed budgetary priorities (Neustadt 1990).

At a more analytical level, we must conclude that there is a clear distinction between influence and success. In some sense, this is the distinction between true leadership and apparent leadership. Recall Dahl's classic formulation of power, namely that **A** is powerful to the extent that **A** can get **B** to do something that **B** would not otherwise do (Dahl 1957; Sigelman 1980; Sigelman and Rosenblatt forthcoming). Crucial to this definition is the condition of **A** altering an outcome. If the president's budget is passed because it is the same type of budget already supported by a majority in Congress, then the president's success may not be due to any form of influence. When the budget is passed over the objections of an opposing majority there is definitely an indication of presidential budgetary influence.

This distinction between success and influence leads our study of the president's role in the budgetary process into two complimentary lines of analysis. First, we need to assess the congruence of presidential budget requests and congressional appropriations. This focuses on presidential success. Second, we need to assess the normal or baseline budget expectations of congressional budgetary decisions and compare them the outcomes of the current process. In other words, we need to know what the budget would look like if we projected out the funding levels from the previous year. This allows us to identify the relative shift in congressional support for budgetary priorities. It allows us a comparison of congressional preferences before and after the president's requests and efforts to influence the passage of those requests.

Measuring Success

Establishing Standards

How are we to evaluate presidential success in the budgetary process? As already indicated, the budget is a very large and complex document with many levels of analysis. These levels of analysis include statements of general goals, targets for the funding of functional categories of federal activity, targets for the funding of cabinet departments, agencies, programs, as well as funding targets for specific line items. Making sense of the concept "success" must be done within this multi-leveled context.

Knowing that the budget may be viewed at all of these levels does not, in itself, identify how we should measure presidential budgetary success. Serious questions remain regarding the assignment of priorities and weights to each of these levels of analysis. Should we look at the broad goals or the specific programs? If we look at specific programs, which ones should we observe? If we observe all programs, how should we evaluate the relative importance of each program? These questions highlight some the concerns about how to evaluate the president's performance in the battle of the budget. For example, was President Clinton unsuccessful because he only got $4 billion out of the $16.1 billion stimulus package that he presented in a $1.5 trillion budget?

Eventually, we must develop effective means for creating a comparable index of presidential success for each fiscal year's budget. But before we can do this, we must identify a

theoretically justifiable standard for weighting the various levels of analysis. *Congressional Quarterly Weekly Report* provides a listing of the votes the editors consider to be the key components of the president's program. The problem with using these votes as the standard for evaluating presidential success is that the measure is *ad hoc;* it is set externally to the process. It is *ad hoc*. What we need is a standard which is set within the context of the process. For it is such a standard that drives the actors involved, themselves. In Dahl's formulation of power, **A** must actually engage in an attempt to change **B**'s behavior. If **A** never indicates a desire to change a particular policy, then **A** is not exercising any influence on that policy. If this is true, then it makes little sense to evaluate **A**'s success based upon the outcome of that particular policy. Any such evaluation is relevant only when we debate the merits of the president's program with some other program. While this type of analysis may be interesting, it is not an analysis of presidential success and influence.

Fishel's work evaluating the congruence of presidential campaign promises with subsequent presidential performance is based upon the simple premise that the candidate's rhetoric is the most appropriate indicator of the standards of performance (Fishel 1985). By applying this principle to the budget process, we can judge presidential success and failure in the process by comparing what a president says he wants with what the president gets. Fishel's approach is even better suited for the budget process than it is for campaign promises because budget rhetoric is more often born out of real world experience, as opposed to campaign idealism.

The identification of appropriate standards for evaluating presidential success in the budgetary process can be gained by reading the president's formal communiqués regarding each budget. Specifically, the annual budget transmittal letter identifies the president's budgetary goals, at all levels of analysis.

Arguably, we may also wish to evaluate presidential speeches and other messages on the budget, but if we do we should be careful to use only those that precede the debate. We should avoid dependence on *post hoc* statements by the president regarding any goals because presidents usually attempt to revise their goals after the fact to enhance the perceptions of their success.

Creating an Index of Budgetary Success

In many ways, the establishment of the standards for evaluating presidential budgetary success is easy compared to actually creating an index of success which is comparable across annual budgets. This difficulty arises at two levels. First, it is certain that the specificity of budget requests by presidents will vary from year to year. This seriously jeopardizes any hope of generating a functional variable. Second, we need to incorporate very distinct characteristics into a single measure. If we hope to preserve an already small sample size of one observation per year, we need a single annual index to measure the president's budget success. If we try to create a separate index for each level of analysis (*i.e.* total budget size, functional category requests, departmental requests, program requests, etc.), each index would have missing values, for in some years the president may not specify goals for some of these levels. This would complicate evaluation of the effects of budgetary reforms, presidential scandals, and other significant events affecting the success and failure of presidents. As the value of measuring the president's success in the budgetary process is inextricably linked to evaluating the impact of these phenomenon, as well as the effect of other variables such as partisanship and elections, the loss of any observations may prove intolerable.

Our efforts, to date, include an exhausting collection of presidential requests from the formal transmittal letters introducing each budget and congressional appropriations for nearly all of the programs identified by Presidents Kennedy through Bush (1963-1990). An explanation of the methodology employed follows this section. In addition, we have collected, where possible, the previous year's presidential requests and congressional appropriations (see Table 1 for a sample of the data we have collected). These data allow us to measure presidential success and congressional support or opposition at the program level. This is only the first step in our research agenda of explaining presidential success and failure in the congressional budget process.

Our goal is to discuss several measurement questions associated with the creation of an annual index of presidential budgetary success.

Incorporating Fiscal Goals

The measurement of success and failure in the budgetary process should reflect the president's preference regarding the level of funding appropriate to each particular program. It is unreasonable to assume that the goal is to maximize budget appropriations. Aside from divergent partisan preferences for existing and proposed programs, the ever-expanding national debt and annual budget deficits have forced us to take a hard look at how much money are government is spending. In many cases, the president may actually seek to reduce expenditures on existing and proposed programs. Presidents ask for increases in some programs and decreases in others (see Table 2).

The federal deficit has plagued Congress and the president for the past decade. The mismatch between revenues and spending keeps growing and a long term solution has proved elusive. The growing fiscal crisis serves to highlight the fact that presidents sometimes seek to reduce funding levels for some programs (CBO 1993). Though high deficits and an ever-growing national debt have focused recent attention on this aspect of budgeting, it is not a new phenomenon. Our research, dating back to the Kennedy Administration, has found that all of the presidents, except for Ford and Bush (in his first budget), expressed the desire to reduce funding for one or more programs (see Table 2 for tallies; also see the fiscal qualifier column in the Table 1 for examples of programs). When we looked beyond the president's rhetoric and compared requested levels of funding with the previous year's requests and appropriations, all of the presidents since Kennedy have sought to reduce funding for some budget line-items.

Any measure of budgetary success that ignores these markers of fiscal priorities and direction of changes to funding levels cannot claim to be an accurate measure. This consideration further indicates the importance of establishing a standard of success based upon the president's own stated goals.

Possible Methods of Measuring Presidential Budget Success

In order to accommodate these concerns, we offer some possible methods for measuring success. Each of the methods offered have their strengths and weaknesses, and the list of possible approaches is by no means exhaustive. Each attempts to develop a measure of presidential success that incorporates the president's fiscal preferences.

For all approaches discussed here, the following process would be used to identify the policy goals of the president. The corresponding funding levels for these goals provide the data for calculating the index. In order to identify the programs used to calculate success, we would generate a list for each year based upon the president's transmittal letter to Congress accompanying each budget. If the president mentions a program it makes our list. Next, using the same letters, we code the president's preference for increasing or decreasing funding to that program. Next we locate each program in the budget document in order to determine the amount of funds requested. Then we locate the same program in the budget document two years after the request in order to get the final tally on congressional appropriations. This allows us to include any, and all, supplemental appropriations. Whenever possible, we would also collect the same line item data for the year prior to the first request. This allows us to compare the truthfulness of the President's fiscal preference (*i.e.*. if the president claimed to request an increase in funds, this could be verified by comparison to the previous years request and appropriations) and it allows us to estimate the expected appropriation from Congress if the president had not tried to change the funding levels.

Once we collect these data, we eliminate observations that measure funding of entitlement programs and department level requests. Entitlements are not controllable and department funding is aggregated at too high a level to be comparable to other programs. Recognizing the physical limitations of the data collection process, we also eliminate suspect programs. Programs are deemed suspect if the label given by the president in the transmittal letter does not clearly match a line item in the budget. Further, some labels in the letter seemed to overlap. We attempt to eliminate one of these redundant measures wherever possible.

Percent Deviation Method. The first possible approach is an attempt to identify the average percent deviation from the president's request. This method may be applied to any of the levels of analysis discussed above. We focus at the program level for the following analyses.

In this approach to creating an annual index of success, we have tried to devise a method that would prevent large budget items from subsuming the smaller ones. As a result, we may have given undue attention to the small items. Specifically, the success index is created by calculating the percent difference for each program's requested funding and the appropriated funding. This percent is then multiplied by 1 if the president intended to increase funding and by -1 if the intent was to cut funding levels. We then take the average of these percentages over the year to produce the final annual index of presidential budgetary success.

$$\text{Success} = \sum ((R_i - A_i)/R_i)(\text{fiscal qualifier}) \qquad \textit{(Equation 1)}$$

The higher the value of this index, the more successful the president.

If we aggregate the program requests and the appropriations before we calculated the percent difference we would overemphasize the big money programs. This method, however, may overemphasize small programs. A simple example will illustrate this problem. If the president requests $1 million for a program and Congress appropriates $5 million, this yields a program score of +500%. If the president requests $100 million for a program and gets $105 million, this same $5 million increase is only 5%. While it may appear reasonable to follow this procedure, generally, if we consider that it is easier to double and triple small programs than large programs, it is likely that annual scores may be driven up disproportionately as a result. In fact, in one observed year a small program over-funded by 1200%.

Variations on this approach include keeping entitlement and department levels requests in the tally, as well as eliminating outlying observations (like the 1200% increase mentioned above). This approach provides us with the mean of the percent difference between requests and appropriations across programs, not dollars, for each year. If we were to tally the total amounts requested per year and the total amounts appropriated for each year for the programs identified by the president before we calculate the percent difference, the measure may offer a usable alternative to the one just described. As suggested in this analysis, however, this approach would bury the president's successes and failures on small programs. This may not be desirable. A current example, President Clinton's National Service Corp, helps make this point. While the price tag on this program is relatively small (approximately $300 million in the first year), the program is a major policy innovation that may set precedent for future policies.

Proportion of the Whole Method. This approach seeks to build into the index the relative fiscal priority of each program. In other words, it is an attempt to measure the relative dollar size of each program used for the annual index.

In this method, we would first find the total of the requests and appropriations for all the programs listed in a given year. Then we would divide each program's request and appropriation by their respective totals. Then we calculate the difference between the quotients and multiply by the fiscal qualifier (1 or -1, depending upon the president's funding goal). Finally, we would sum each of these modified differences to generate an annual index.

$$\text{Success} = \sum (R_i/R_t - A_i/A_t)(\text{fiscal qualifier}) \qquad \textit{(Equation 2)}$$

The higher the value of this index, the more successful the president.

Other Methods. The question remains as to what method is best. These and other possible methods must be evaluated as to the context they incorporate. Do the measures consider the policy priorities of the president? Are certain types and sizes of programs over emphasized? So far, we have not found the perfect measure. This paper, as mentioned earlier, is an attempt to foster a discussion toward resolving this problem.

Factors Influencing the Budget Process

Any effort to measure presidential success in the budgetary process should have two primary goals. First, it should seek to provide a more objective standard for evaluating the successes and failures of a presidential administration. Political debates regarding the state of any administration are too often distastefully biased, mean-spirited, and misleading. While we may never be able to change the dispositions of the spokespersons for each side, we may be able to establish a more objective frame of reference as a backdrop to the debate. Second, as political scientists, we should use this type of index as a dependent variable in a model that attempts to explain under what circumstances the president is more or less successful. Having said this, we now offer a general outline of the factors that seem likely candidates for this explanatory model.

The outcome of the budgetary process would seem to be dependent upon the following factors: presidential resources, congressional resources, and three environmental contexts (the prevailing political environment, the prevailing economic environment, and the constraints created by previous budgets). Each of these have numerous components of varying relevance, but overall, they appear to capture the full context of the process.

Presidential Resources

Public Support for the President. Electoral support, job approval, and general policy support in the public provides the president with added leverage in the policy making process. The stronger public support for the president, the more likely Congress will yield to administration requests (Pritchard 1983; Rivers and Rose 1985; Bond and Fleischer 1990; Bartels 1991). To this extent, we should consider the president's approval and disapproval ratings at the moment of the budget's introduction. This provides some context for the nation's first impression of the president's budget. We should also consider the ongoing level of approval throughout the process. If the president remains popular during the decision-making process, Congress would be more likely to yield to the proposals.

Public support for the president and public support for specific policies also enhance the president's position in this process. Being aware of this, president's will often campaign to increase the levels of public support. Nationally televised speeches, visits to regions affected by policy proposals, and other public relations efforts often effect these levels, though not always in the desired direction (Ragsdale 1984, 1987; Simon and Ostrom 1989; Gilboa 1990; Rosenblatt 1992; Brace and Hinckley 1992; Sigelman and Rosenblatt forthcoming).

Staff Resources for Formulation and lobbying for the Budget. The concentration of staff and money resources in the Bureau of the Budget and later the Office of Management and the Budget provide the president with the ability to conduct comprehensive analyses in order to develop a coherent, extensive budget proposal. Furthermore, this resource provides the president with an enhanced ability to lobby Congress for the proposed budget.

History of Legislative Success in Congress. When presidents are successful in Congress they can gather momentum. As the White House racks up more victories, Congress is placed under greater pressure to support the budget. If the president is floundering, opportunities emerge for Congress to reassert itself. While there are objective measures of legislative success, this phenomenon may also reveal itself if the president has the appearance of floundering. Brace and Hinckley (1992) find that when Presidents pursue larger legislative agendas, their success rates decline. This may lead to a situation where a president may succeed in getting a large number of programs passed, while being perceived as ineffective due to the proportionately higher number of losses. This may explain the differences between the records and reputations of Presidents Carter and Reagan.

Presidentially Relevant Events. The occurrence of presidentially relevant events that enhance or detract from public support effect the level of presidential support and influence. Major foreign policy events, especially those highlighted by Administration communications efforts, tend to drive

up presidential approval (Jentleson 1992). Domestic travel often creates more focus on negative developments in the economy. This tends to drive down approval (Brace and Hinckley 1992). These events may be characterized in terms of the control the president has over them.
1) *Non-discretionary Events.* Many of these events are beyond the control of the president. Invasions, terrorist attacks, massive job lay-offs are driven by external factors. While the president may be able to capitalize on some of these events, such results come from reaction.
2) *Discretionary Events.* Other events are constructed by the president. Summit meetings, Executive Orders, etc. can create events that have an effect on approval, although not necessarily positive (*i.e.*. Ford's pardoning of Nixon).

Congressional Resources

Public Support for Congress. Congress culls public support in two ways, they can cultivate it directly from the public or they can capitalize on the President's decline of public support. This suggests that some aspects of the relative public support of Congress and the president are non-zero sum games and other aspects are zero-sum games. Though congressional approval is generally very low, the evaluations of individual members tends to be much higher. Perhaps the best indication of public support for Congress lies in the incumbency rate and the number of safe seats.

Institutional Strength. Some of the institutional strength of Congress are born out of its electoral record (*i.e.*. seniority of members). Others come from the working dynamics of coalition building in the chambers. Measures like Party Unity and the Conservative Coalition identify the level of cohesiveness in the legislature. To borrow a phrase from Abraham Lincoln, "A house divided cannot stand." The ability of Congress to counter presidential dominance in the budgetary process is enhanced when winning coalitions emerge to guide the formation of the budget.

Staff Resources. Like the president, the Congress also has staff and money resources for formulating a budget. Initially, these were focused in the House Ways and Means and the Senate Finance Committees. Eventually, Much of the budget authority was shifted to the Appropriations Committees. In 1974, CBICA created Budget Committees in both chambers and the Congressional Budget Office, further enhancing the amount of resources available to Congress for this process. Note, however, that while the Presidents staff resources are centrally organized, Congress's is not. This may make direct comparisons between the two branches difficult.

Work Load. The larger the workload of Congress, the less able it would be able to focus energy on counter presidential budget influence. Congress has attempted to streamline the process through various reform acts, though these may have caused an increase in workload.

External Actors. The opening of the congressional decision-making process may bog it down. Open hearings provide access for many voices to be heard. At the same time, it may reduce the behind the scenes decision-making. A countervailing force may be the level of influence and contributions made to Congress by PACs.

The Policy-making Environment

General Political Environment. Shifts in the political climate and the electoral cycle create a fluctuating policy-making environment. During election years, much of the activity in Washington is an attempt to posture for successful re-election. Constituent pressures may force greater partisanship. Even within parties, divisive posturing may emerge between the liberal and conservative wings of each party.

Scandals and wars can also drastically change the policy-making environment. When such drastic events and revelations reflect poorly upon the president they can erode public approval and thereby enhance the bargaining position of the Congress. Negative events and national conditions may actually force members of Congress to distance themselves from the president in order to

preserve the support of their constituencies. Likewise, when scandals occur implicating the Congress, the president may be driven to step back from the fracas.

While these reactions these events and conditions may promote a knee-jerk reaction among policy makers to distance themselves, such a reaction may prove to be counterproductive to the overall ability to govern. The current battle between President Clinton and Congress over the FY1994 Budget offers an illuminating example. Both Clinton and Congress are suffering from the effects of negative events and conditions. Clinton's problems with job approval scores and the fact that he won only 43% of the vote with Ross Perot remaining on his heels, and Congress's problems with the House Post Office scandal could yield disaster if both sides seek to distance themselves from each other. Such a reaction, while political justified in the most cynical interpretations, might destroy any hopes of the budget's passage. Such an outcome, itself, would have tremendous political fallout. In some ways, confronting the budget crisis may be a no-win situation. Political demise lurks around every corner.

Wars can also cut both ways. A popular war can play well into the hands of its supporters (for a recent discussion of this "Rally around the flag" effect see Brace and Hinckley 1992). Obviously, in the case of a war, the president is seen as a supporter. As commander-in-chief of the armed forces, the president is a driving force in the conduct of a war. Within Congress, some members may be seen as supportive, some not. As long as the war is popular, these actors will benefit. When a war is unpopular, the president can take a severe nose-dive in the polls. Anti-war forces may gather strength and enhance Congress's bargaining position.

Overall, the general political climate can account for the rise and fall of both presidential and congressional resources. The net effect of these changes may swing the budget debate in one or the other direction.

General Economic Environment. Since one of the key pivots to the budget debate is the role of fiscal policy as a means of economic stimulus, the condition of the economy is an important factor in the budget process. The levels of unemployment, inflation, and the combination measure called the misery index (inflation plus unemployment rates) effect concern for both the focus of policy priorities and the concern for fiscal integrity. As more citizens are economically dislocated, demand for federal support rises. Meanwhile, the dislocation also undermines the federal government's revenue raising potential. This dilemma heightens as the problems within the budget, itself, become more critical.

The Budget Context. The current state of budgetary affairs has a great deal to do with the decision-making environment of the next budget. If the current budget is under stress due to high deficits, excessive taxes, or controversial spending priorities, then the debate over the next budget is likely to be driven toward those aspects of the package. An over-emphasis on one of these concerns may even lead to legislative paralysis or palsy. This type of breakdown may have ripple effects throughout the entire budget process. It can lead to declines in capital markets, rises in interest rates, a breakdown in bipartisanship, and a gutting of public support for the government. Each of these potential outcomes, in themselves, undermine the successful passage of the budget. The end result is a steady slide into gridlock.

Hypotheses

Given the preceding analysis, the following hypotheses should be tested:

H1: Relative increases in presidential resources increase the level of presidential success in the budget process.

H2: Relative increases in congressional resources decrease the level of presidential success in the budget process.

In addition, each of the various contexts should, inevitably, effect the balance between the president and the Congress. Changes in the political and economic environment may greatly enhance or diminish both presidential and congressional resources. Budget constraints may prevent either side from exerting any influence.

Conclusion

Our project raises several important points about explaining presidential success and failure in the congressional budget process. First, the establishment of a standard for evaluating presidential success should be determined by the president's own stated goals. While analysts external to the process may be able to identify other important criteria, if the president does not attempt to achieve them they are not directly relevant to discussions of presidential influence and success. Second, success in the congressional budgetary process is not simply a matter of getting at least as much as requested. Budget maximization is not a universal goal, and it should not be treated as such. Third, presidential success can be measured at any level of budgetary aggregation. To the extent that the president identifies more than one level in a given year, the creation of a coherent index becomes very difficult. To the extent that the president identifies different combinations of levels of aggregation (i.e. large increases, moderate increases, and decreases) in budgetary goals statement, comparability of any index across years becomes difficult.

While we may be able to specify a reasonable model of the factors influencing the level of presidential success and failure in the congressional budget process, the problems associated with creating a objective annual index may preclude the testing of any such model. It is therefore imperative that we direct our efforts at developing a usable index if we are ever to unravel the confusion surrounding the presidential-congressional battle of the budget.

Note: The authors would like to thank the Center for Congressional and Presidential Studies, School of Public Affairs, at The American University for supporting this research.

Voter Turnout:
Myth and Reality in the 1992 Election

Abstract

After three decades of decline, voter turnout rose 5.1 percentage points in 1992, to 55.2 percent. Unable to round up their usual suspects, political commentators looked to the peculiar aspects of the 1992 campaign for explanation. Some saw the increase as the electorate's angry outburst against the architects of a failing economy. Some took the increase as a popular uprising against an arrogant, aloof, and unresponsive government in Washington. Others credited the increase to the personal appeal of a maverick independent presidential candidate, H. Ross Perot.

In the first part of this paper, we test these popular propositions and find that none stands up to careful scrutiny. Using data from the 1992 National Election Study, we discern no relationship at all between voter participation and concern over the economy, disaffection from government, and the appeal of Ross Perot. The idiosyncrasies of the 1992 campaign do not explain the increased public involvement in the electoral process.

In the second part of this paper, we offer a positive program, a systematic way of understanding voter involvement in 1992 and more generally. Applying a general theoretical model of political participation and using estimates derived from earlier elections studies, we show that processes that caused voter turnout to increase in 1992 are the same processes that caused voter turnout to decline in previous years. Turnout rose in 1992 because the electorate's resources were augmented by additional education, additional efficacy, and additional experience. Turnout rose in 1992 because the electorate's interests were engaged by more attractive choices and more momentous stakes. Turnout rose in 1992 because the electorate was more extensively mobilized by campaigns, interest groups, and activists motivated by the closest presidential election in a decade. Turnout rose in 1992, finally, because the impediments imposed by voter registration laws abated ever so slightly.

This paper relies on data from the 1952-1992 American National Election Studies conducted by the Center for Political Studies of the Institute for Social Research under grants from the National Science Foundation. The data were made available by the Inter-university Consortium for Political and Social Research. Neither the original collectors of these data nor the ICPSR are responsible for our analysis and interpretations.

We appreciate Mary Jo Sofflet's assistance in making ready the final manuscript.

Voter Turnout:
Myth and Reality in the 1992 Election

Among the many surprises in an unusually surprising 1992 election season was the 5.1 percentage point increase in voter turnout. Fifty-five and two tenths percent of Americans of voting age, over 104 million people, cast a presidential ballot in 1992, lifting voter turnout to its highest level in a quarter century. (See Figure 1.)[1] The gain was the first since 1984 and the largest since 1952. In a single year, voter participation made up nearly half of the much-deplored and much-conjectured 12.7 point decline in turnout since 1960.

[Figure 1 here]

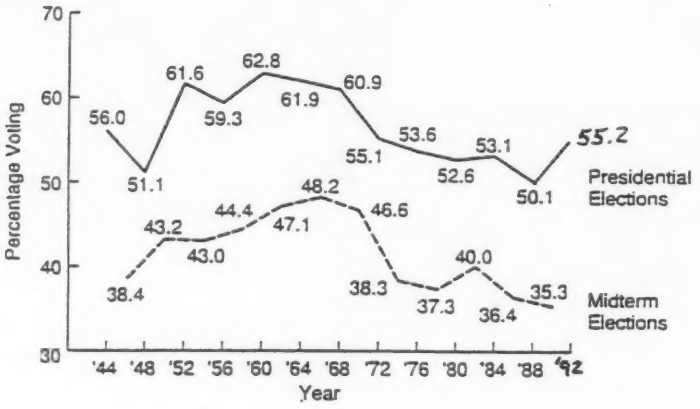
The increase in turnout in 1992 was at the least inconvenient: a legion of specialists who had devoted year upon year to refining their diagnoses of the chronic decline of participation now suddenly had to confront the abrupt revival of the patient. Their explanations, generated in the heat of a reporter's deadline, were a mix of the old and the new, but in some way echoed the particular content of the 1992 campaign, its issues, its context, and its personalities. Some observers saw the increase in turnout as the electorate's angry outburst against the architects of a failing economy. Some took the increase as a popular uprising against an increasingly arrogant, aloof and unresponsive government in Washington. Others, finally, credited the increase to the personal appeal of a maverick independent presidential candidate, Texas billionaire H. Ross Perot.

---

[1]The turnout percentages displayed in Figure 1 are aggregate estimates based on votes cast for president divided by the U.S. Census Bureau's estimate of the voting-age population. Source for 1992: U.S. Department of Commerce, "Voting Age Population Will Total 189 Million in '92 Presidential Election, Census Bureau Says," 18 February 1992, Table A; *Congressional Quarterly Weekly Report*, 30 January 1993, p. 233. Survey estimates of turnout also found participation higher in 1992. The November 1992 Current Population Survey conducted by the Bureau of the Census showed turnout up 3.9 percentage points over 1988. Jerry T. Jennings, "Voting and Registration in the Election of November 1992," Current Population Reports, Series P20-466, U.S. Department of Commerce, April 1993, Table A. Estimates based on data gathered by the National Election Studies detected a 5.7 point increase in reported turnout over 1988. Estimates of voter turnout from sample surveys are always different than estimates from aggregate counts of ballots cast. The pluses and minuses of each approach are described in Steven J. Rosenstone and John Mark Hansen, *Mobilization, Participation, and Democracy in America* (New York: Macmillan, 1993), pp. 58-59, n. 19.

Figure 1

Voter Turnout, 1944-1992



As attractive and as plausible as these accounts might seem, however, none stands up to careful empirical scrutiny, and it is one of the burdens of this paper to provide such investigation. The larger aim of this paper, however, is to provide a positive program, to advance a systematic way to understand turnout in 1992 and more generally. The sources of the increase in turnout in 1992, we will argue, were in fact the same as the causes of the decline in voter turnout in years prior. Voter participation rose in 1992, that is, not because of the idiosyncrasies that made 1992 different from other years but because of the processes that made it the same. Turnout grew in 1992, we will show, because the electorate's resources multiplied, because the polity's sense of investment in the outcome deepened, and because the competitiveness of the campaign forced parties, candidates, and other activists to redouble their efforts to turn people out to vote.

Once the systematic causes of voter turnout--the resources and the interests of voters, the mobilization efforts of parties and campaigns--are taken into account, we find, there is little of the increase left to explain; what there is left, moreover, is not very well accounted for by the idiosyncratic elements of the 1992 campaign. The way to understand participation in 1992, we suggest, is as a piece with participation more generally. Voter turnout rose in 1992 for the same kinds of reasons that it declined in years prior.

The Proto-Mythology of Voter Turnout in the 1992 Election

In 1992, say Germond and Witcover, voters were beset by economic troubles, angry, apprehensive, and frustrated. "Added to this mix was the combustible Ross Perot--a match on dry tinder. He was in a real sense the embodiment of the American voter who was fed up with politics as usual. . . . There is no doubt [his effort] contributed greatly to shaking the political lethargy and apathy that had captured the country for so long."[2] The combination of economic distress, public alienation, and cynicism incarnate, they, like others, hold, influenced not only

---

[2]Jack Germond and Jules Witcover, *Mad as Hell: Revolt at the Ballot Box* (New York: Warner Books, 1993), p. 514.

the preferences of the American electorate but its willingness to express them. The economy, the disaffected, and the independent candidate caused turnout to rise in 1992.

These are claims we are able to test. In *Mobilization, Participation, and Democracy in America* we estimated a model of voter turnout on data from the 1956 to 1988 National Election Studies. Here, we estimate the same model on the data from the 1992 National Election Study. The basic model takes into account individual resources, evaluations of the political parties and their candidates, social involvement, electoral mobilization, and the legal organization of elections. To these variables we add indicators of concern about the economy, disaffection from the political system, support for Ross Perot, and contact with his campaign.[3] Overall, the economy, the alienated, and Perot account for very little voter turnout in 1992, even before we control for other causes of citizen involvement. Consider them in turn.

1. The Economy

There can be little doubt that the sad state of the U.S. economy was the dominating issue of the 1992 presidential election campaign. The economy was undeniably bad. Unemployment was at 4.9 percent when George Bush took office, but it topped 7.5 percent in 1992. People knew the economy was bad. Asked in July 1992, 34 percent identified "the economy" as the most important problem facing the nation and another 20 percent identified "jobs." Bush's opponents sensed that the economy was the President's Achilles heel. The overriding message of their 1992 campaigns boiled down to the hand-lettered reminder posted in Clinton's campaign headquarters: "It's the economy, stupid."

---

[3]The coding of the variables follows the coding reported in Appendix B of Rosenstone and Hansen, *Mobilization, Participation, and Democracy in America*, with some exceptions. Income is a 24-category variable recoded to a 0-1 interval. Internal efficacy is a scale coded onto a 0-1 interval built from five questions (M1d through M1h of the 1992 NES Post-Election Survey); together they have a reliability of .81. The number of neighbors to whom the respondent talks regularly varies between 0 and 5 (for more than 5 neighbors). Finally, each measure of contact (with a party, with somebody other than a representative of a party, and for purposes of encouraging participation in particular electoral activities) is coded 1 for contact and 0 for none. The estimates of the effects of these variables are reported in the appendix to this paper.

In the light of the results of the 1992 election, commentators deemed it likely that voters' anger over the foundering economy not only influenced their Election Day choices but also drew them out to the polls, helping to account for the rise in voter participation. "The prevailing discontents made it all the more striking that voter turnout in 1992 reversed the long decline in participation," Wilson Carey McWilliams argued. "That the race was apparently closing undoubtedly helped, as did the fact that so many voters felt themselves immediately threatened by the recession." Curtis Gans agreed: "The biggest factor [accounting for the rise in voter turnout] is the recession." "Recession always tends to focus the mind and increase turnout." "Increased voter interest," Walter Dean Burnham concluded, "is in large part driven by 'economic stress.'"[4]

There is an undeniably attractive logic to this line of reasoning: The people who have suffered in the recession rise up to demand an accounting from their leaders. The only problem is that there is no careful evidence to support this proposition. (In fact, as we shall show in a moment, there is good evidence the relationship between economic conditions and voter turnout is the exact *opposite* of Gans's firm pronouncement.) Using the data from the 1992 National Election Study, we compared the turnout rates of the unemployed to the employed; the turnout rates of those whose financial condition had worsened to those whose well-being had improved;[5] the turnout rates of those who believed that the government's policies had made them worse off to those who believed that the government's policies had

[5]Our measure of economic well-being summarizes responses to eight questions: whether over the last year the respondent was better or worse off financially, had a positive or negative change in income, had to put off buying things, had to put off medical or dental treatment, had to borrow money, or had to look for additional work, and whether she was able to save money or had fallen behind on rent or house payments. Together the eight items form a single dimension with a scale reliability of .72. For more on the provenance of these items see Steven J. Rosenstone, John Mark Hansen, and Donald R. Kinder, "Measuring Change in Personal Economic Well-Being," *Public Opinion Quarterly*, 50 (Summer 1986), pp. 176-92.

made them better off; the turnout rates of those who thought the nation's economy had declined to those who thought the nation's economy had gotten better; and the turnout rates of those who claimed that the economy was the most important problem facing the nation to those who identified other problems. Table 1 presents the results, first showing the bivariate relationships between participation and economic condition and then showing the relationship controlling for participation's other causes: individual resources, evaluations of the parties and candidates, social involvement, electoral mobilization and the legal organization of elections.

[Table 1 here]

For advocates of the view that economic distress provoked people to take part in the electoral process, the results leave only a thin reed of hope. Citizens who saw the economy as the nation's most important problem or who believed that government policies had worsened their condition were more likely to turn out to vote, but citizens who were unemployed or who were worse off financially were less likely to turn out to vote.[6] Once the other causes of participation are taken into account in the multivariate analysis, however, only those who believed the economy to be the most important problem facing the country were any more or less likely to vote in 1992.[7]

Although these cross-sectional estimates suggest that citizens who identified the economy as the nation's leading problem were more likely to vote, for several reasons, however, we regard this finding with some skepticism. Of all the available measures of the concern about the economy, the most important problem is the furthest removed from the claim that those adversely affected by the economy turnout to hold leaders accountable. The

---

[6]Our analysis of pooled data from 1956 to 1988 reveals a consistent, strong, and significant negative effect of unemployment. The pooled estimate is by far the better one: the number of observations is much larger and unemployment has greater variability both over time and across individuals rather than merely across individuals at a single point in time.

[7]In order that collinearity among the economic variables might not distort the results, we entered each variable individually in the equation for each form of electoral participation. Thus for turnout, there are five equations: one for each economic measure, also controlling for the other causes of participation. None of the conclusions we draw from the multivariate analysis changes if all the economic variables appear together on the right-hand-side of the equation.

*prob < .10
**prob < .05

reason why this measure was the only one of the five to yield the "right" coefficient is utterly mysterious. Given the primacy of economic issues in the 1992 campaign, moreover, it is at least as likely that the relationship is spurious as it is causal. The people who were moved to participate by the efforts of others--by what we will soon call "mobilization"--were also likely to have internalized the arguments their contacts offered.

If we look a little further, our doubts increase. The 1992 National Election Study asked people whether they had tried to influence somebody else's vote, attended a political meeting or rally, worked for a party, or contributed money to a party or candidate. Table 1 also presents the relationships between participation in these activities and the degree of concern over the economy. Thirteen of the 25 probit coefficients have signs suggesting that preoccupation with the economy increased participation; 12 coefficients suggest preoccupation with the economy reduced participation. Only 3 of the coefficients that show participation higher among those most preoccupied with the economy are statistically significant. But, there are also 3 "significant" coefficients showing that preoccupation with the economy reduced participation. The most reasonable conclusion, we think, is that economic worries have no consistent effect on participation in elections, and the positive relationship between the opinion that the economy is the nation's leading problem and voter turnout does not fit into a broader pattern.

The final reason for our skepticism is that this single finding to link economic worries to voter turnout runs counter to a host of empirical evidence for the contrary. Not a single investigation that we have encountered turns up evidence that electoral participation in America is higher among people who have experienced economic setbacks or during periods of economic difficulty. Some scholarly studies discern no relationship between economic conditions and participation; others (including ours) find that a poor economy reduces voter turnout.[8] Economic hardship, we have argued elsewhere, taxes the resources people need to

[8]See Francisco Arcelus and Allen M. Meltzer, "The Effect of Aggregate Economic Variables on Congressional Elections," *American Political Science Review* 69 (December 1975), pp. 1232-39; Morris Fiorina, "Economic Retrospective Voting in American National Elections: A Micro-Analysis," *American Journal of Political Science*

participate in politics, reducing their income, their time, and their attention. As angry as they might be, voters facing difficult financial times have other more pressing demands on their resources than participation in politics.

All in all, then, we read the evidence to say that the economy had very little, if anything, to do with the rise in voter turnout in 1992. But suppose, for the sake of argument, that the lone finding in the favor of the hypothesis is real. Imagine that 1992, for whatever unspecified reason, was the proverbial exception to the rule. Given the size of the estimated effect, how much could the increased salience of the economy have contributed to the increase in turnout between 1988 and 1992? This is a simple calculation that requires us to estimate what turnout would have been among NES respondents in 1992 had the economy been as salient in 1992 as it was in 1988. The answer is, not much. In 1988, 42 percent of the electorate named the economy the country's number one problem; in 1992, 63 percent did. Under the best case scenario, the 21 percentage point increase in the salience of the economy lifted turnout by about .79 percentage points. Even when we put aside the most reasonable interpretation of the data and let our imaginations take flight, concern over the economy could not have contributed even 1 of the 5.1 percentage point increase in voter turnout between 1988 and 1992.

It's not the economy.

2. The Insurrection of the Alienated

By now, twenty years after Watergate and the end of the war in Vietnam, "outsider" campaigns are a staple of American elections. Even so, in the bilious commentary on radio

Rosenstone, "Economic Adversity and Voter Turnout," *American Journal of Political Science* 26 (February 1982), pp. 25-46; Gregory A. Caldeira, Samuel C. Patterson, and Gregory A. Markko, "The Mobilization of Voters in Congressional Elections," *Journal of Politics* 47 (May 1985), pp. 490-509; Priscilla L. Southwell, "The Mobilization Hypothesis and Voter Turnout in Congressional Elections," *Western Political Quarterly* 41 (June 1988), pp. 173-88; Benjamin Radcliff, "The Welfare State, Turnout, and the Economy: A Comparative Analysis," *American Political Science Review* 86 (June 1992), pp. 444-54; Rosenstone and Hansen, *Mobilization, Participation, and Democracy in America*, pp. 81-82, 112-113, 135.

call-in shows, in the vengeance visited on congressional check-kiters, in the popularity of term limitation initiatives, in the persistent damage to the Bush candidacy from a broken campaign pledge, and in the appeal of outsider candidacies such as Perot's, political observers in 1992 found a new crest in the rising tide of popular cynicism and distrust toward American government. Indeed, the readings from the 1992 National Election Study were as bad as ever: as shown in Figures 2 and 3, trust in government was down, confidence in the government's responsiveness was up by a micron, and both were about as low as they have ever been.

[Figures 2 and 3 here]

Without even looking at the data from the 1992 election, though, we can state categorically that popular disaffection did not influence voter turnout either one way or the other. Twenty years of survey research has consistently concluded that distrustful and cynical citizens are neither more (nor less) likely to participate in the voting than their pollyannaish neighbors.[9] The data displayed in Figures 2 and 3 should raise further doubts. Although trust in government and a sense of government responsiveness rose between 1980 and 1984, for example, turnout barely budged. In 1992, turnout rose to the highest level in 25 years while popular confidence in government remained at historic lows.

Even so, commentators have long pointed to popular alienation from government as a leading cause of Americans' disengagement from the electoral process. As one reporter put it, in the sixties, seventies and eighties voter turnout was "driven down by apathy and general disaffection with politics and politicians."[10] But when turnout revived in 1992, some of the same commentators credited it to the public's being fed up with the foibles of politicians. Voters were "mad as hell," Germond and Witcover wrote, with negative campaigns and

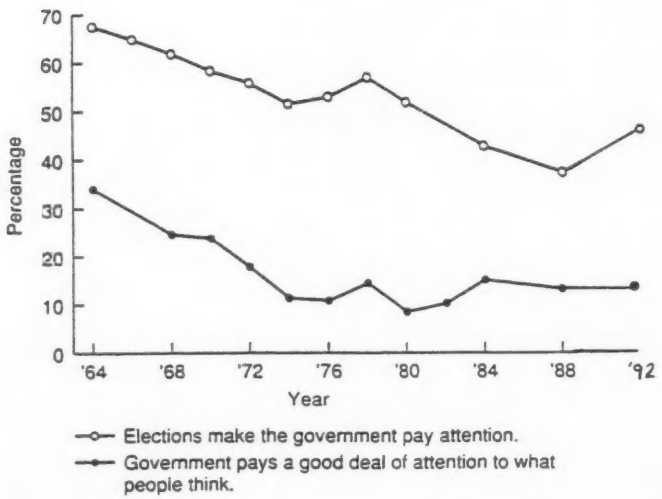
Government Responsiveness, 1964-1992



politics-as-usual.[11] If this were true, if alienation from government caused turnout both to decline and to rise, popular distrust and cynicism would constitute one of the most powerful explanations of the behavior of the American electorate ever discovered--the phlogiston of American political analysis.

But, even in 1992, even with scandals and broken promises and prominent "non-politicians" stoking the public's fury, it was not true. Citizens who most doubted the responsiveness of the government in Washington were not more likely to turn out to vote; neither were they less likely. (See Table 2.) Likewise, citizens who least trusted the government to do what is right were not more prone (nor less prone) to vote, once other causes of political involvement have been taking into account.[12] Alienation and distrust bore no relationship to any other kinds of participation in elections either, with one utterly charming exception: the disaffected were more likely to try to influence the voting choices of others!

In short, public disaffection from government does not move voter turnout.

[Table 2 here]

3. Ross Perot

Of all the possible explanations for the increased voter participation in the 1992 election, the one that most captured the fancy of political analysts was the strange, on-and-off-and-on-again candidacy of Ross Perot. Perot's populist affectations, his enthralled legion of "volunteers," his extraordinary showing--at 19 percent of the popular vote, the second best finish by a 20th century independent--all pointed to a sensational appeal, enough even to beguile the apathetic and the jaded out of their long expatriation. "Perot certainly contributed

[11]Germond and Witcover, *Mad as Hell*, p. 16. In advance of the election, in fact, some observers could not make up their minds about what effect public disaffection might have on turnout--it might make it go up, but by the same token it might make it go down. "People might not vote at all," Walter Dean Burnham commented. Cook and Elving, "Race Tightens," pp. 3502-3503.

[12]Our measure of trust in government is a four-item scale based on responses to the four questions displayed in Figure 2. The scale reliability over the years 1964-1988 is .72. Our measure of government responsiveness is a two-item scale based on responses to the two questions displayed in Figure 3. Responses to these two questions are correlated at .38 over the years 1964-1988.

to the sharp increase in voter turnout," Gerald Pomper stated. Perot's candidacy sparked "the interest of otherwise disengaged voters," one reporter wrote. His "specific appeal to people who felt disenfranchised and had not voted in recent elections," Curtis Gans commented, boosted turnout in 1992. "People who backed Perot," he elaborated, "have been largely absent from the political process in recent years." The Perot campaign, of course, was only too pleased to take the credit for the swell of public involvement in the electoral process.[13]

Already, however, we have thrown cold water on at least one part of this argument. As the preceding section demonstrated, the alienated, the distrustful, and the skeptical were not more likely to vote in 1992. Whomever Perot brought into the process, if he brought anybody at all, they were not the disaffected.

But the Perot campaign might have activated voters in other ways. For one, citizens may have responded to Perot's personal appeal, turning out merely to gain the satisfaction of making a point or the pleasure of helping a such an heroic guy to win.

This line of argument does not stand up either: Perot's enthusiasts were no more likely to turn out than his detractors or the handful of voters who were indifferent to him. Whether or not we take other causes of electoral participation into account, citizens who placed Perot high on a 100-point "feeling thermometer," citizens who fixed Perot higher than both Bush and Clinton on the thermometer, and citizens whose positive views of Perot overbalanced their negative views were no more and no less likely to cast a ballot in 1992.[14] (See Table 3.)

Pomper, ed., *The Election of 1992* (Chatham, N.J.: Chatham House, 1993), p. 142; Richard Benedetto, "Turnout Tops 100 Million for First Time," *USA Today*, 5 November 1992, p. 6A; Doug J. Swanson, "Voters Turn Out in Record Numbers; Economic Worries Loom Large Over U.S.," *Dallas Morning News*, 4 November 1992, p. K1; Robert Pear, "The 1992 Elections: Disappointment -- The Turnout: 55% Voting Rate Reverses 30-Year Decline," *New York Times*, 5 November 1992, p. B4; Inter Press Service, "United States: Elections Brought Highest Turnout in 20 Years," 5 November 1992. Also see Jeffrey Schmaltz, "The 1992 Campaign: The Voters; Americans Sign Up in Record Numbers to Cast a Ballot," *New York Times*, 19 October 1992, p. A1; Cook and Elving, "Race Tightens," pp. 3498-3503. Fifteen percent of Perot's voters told interviewers that they would have stayed home had Perot not been on the ballot. Evidently, nobody thought to ask the same question of Bush and Clinton voters. See Rhodes Cook, "Clinton Picks GOP Lock on the Electoral College," *Congressional Quarterly Weekly Report*, 7 November 1992, p. 3553.

[14]Perot returned to the presidential campaign half-way through the NES pre-election field period and so the open-ended likes/dislikes questions were asked of only about half of the NES pre-election respondents. Although

Perot's sympathizers were neither more nor less likely to attend a rally, to work for a party, or to contribute money to a party or candidate, but they were more likely--about 11 percent more likely--to try to convert others.[15] The surge in voter turnout was not brought about by Perotites, Perotians, Perotistas, or Perotazoa.

[Table 3 here]

A second possibility is that the rise in voter turnout was created by the activities of Perot's campaign. This, we believe, is a line of argument that holds more promise. Perot, independently wealthy, spent at least $60 million on his bid for the White House. Part found its way to national, state, and local campaign organizations in all 50 states. Staffed both by employees and volunteers--many recruited from among callers to Perot's toll-free telephone number--the campaign gathered many times the 780,000 signatures needed to place Perot on the ballot nationwide. Even while Perot sat out of the race, from July to September, the campaign maintained the organizations, and during the fall they did what all campaign organizations do: organize, contact, and mobilize friends, neighbors, and co-workers. By election day, Perot's campaign had personally contacted about 2.8 percent of the electorate, some 5.3 million Americans.[16]

In *Mobilization, Participation, and Democracy in America* we made the analytical case that such personal contacts, such mobilization efforts, are extremely effective in turning people

---

the Perot, Bush, and Clinton feeling thermometers were asked in both the pre- and post-election surveys, we rely on the post-election feeling thermometers because roughly half the pre-election respondents were asked about Perot before he resumed his campaign. The three measures of empathy for Perot are correlated, of course: responses to the Perot feeling thermometer are correlated .38 with responses to the likes/dislikes question and .50 with preference for Perot over Clinton and Bush. Responses to the likes/dislikes questions are correlated .34 with preference for Perot over Clinton and Bush.

[15]For obvious reasons, the three measures of solidarity with Perot do not appear together on the right-hand-side of an electoral participation equation. Instead, each alternative measure is entered individually in the equation for each form of electoral participation. Thus for turnout, the probit coefficients reported in Table 3 come from three probit equations: one with the Perot feeling thermometer; one with responses to the Perot likes/dislikes questions; and one with the measure of preference for Perot over Bush and Clinton (each equation controlling for the other causes of participation that appear in the appendix).

[16]Ten percent of the respondents to the 1992 National Election Study report that someone other than a representative of the two major parties came around and talked to them about supporting a candidate in the election. On a follow-up question, 28 percent of these respondents said they were contacted by an independent presidential candidate, presumably Ross Perot.

Table 3

Relationship Between Alternative Measures of Sympathy for Ross Perot and Electoral Participation in 1992

A. Bivariate Analysis[1]

	Voted	Tried to Persuade Others	Worked for Party or Candidate	Attended Meeting or Rally	Contributed Money to Party or Candidate
Perot Feeling Thermometer					
0-49 (cold)	77.3	38.2	4.2	8.6	7.3
50 (neutral)	70.4	29.7	2.3	7.7	6.7
50-100 (warm)	79.1	43.3	3.7	8.2	8.1

out to vote. They exploit existing webs of friendship and social obligation, providing the intelligence and the social incentives needed to overcome the costs of information, the costs of participation, and the temptation to free ride.

Perot's mobilization was likewise effective, at least on voter turnout: Citizens contacted by someone other than the two major parties were 5.5 percentage points more likely to vote than people who were not contacted.[17]

In the aggregate, however, the effect of personal contacts with Perot's campaign on voter turnout was very small. His forces caused 2.8 percent of the electorate to become 5.5 percent more likely to vote, but that yields a total increase in turnout of only .15 percentage points. Moreover, mobilization by Perot forces did not have a detectable effect on the likelihood of people trying to persuade others how to vote, working for or contributing money to a party or candidate, or attending meetings or rallies. Turnout, but no other form of electoral participation, was incrementally higher than it would have been in 1992 had Perot's campaign not been in the field.

So why was the impact so small? For one thing, put in perspective, the Perot campaign did not devote very much energy or very many resources to voter mobilization. While the independent candidate managed to contact 2.8 percent of the electorate, the major parties typically reach 25 percent between them; in 1992 they contacted 20 percent of the electorate.[18] Instead, the Perot campaign concentrated its efforts on the instruments of persuasion, spending $45 million of its $60 million budget on television advertising and "infomercials." In many respects, the Perot organization was the quintessentially modern

[17]We calculate the probability that each individual would participate under two scenarios: first assuming that the respondent was not contacted by someone other than a person from the two major parties, and the second assuming that the respondent was contacted by someone other than a person from the two major parties, each time allowing all other variables to take their observed values. The reported effect is the difference between these two probabilities, averaged across the entire sample.

[18]Rosenstone and Hansen, *Mobilization, Participation, and Democracy in America*, p. 163. The 1992 estimate of contact with the Perot campaign may be a bit on the low side. The party contact question explicitly asks the respondent about interactions with someone from the two major parties. The measure of contact with the Perot organization relies on volunteered responses to an open-ended question about contact with someone other than a person from the two major parties; it makes no specific mention of Perot.

campaign. All election campaigns have increasingly abandoned voter mobilization for media buys; in fact, we will show in a moment drop in personal contact with the Democratic and Republican parties actually held voter turnout below what it could have been in 1992. The quantum difference was that Perot's campaign (like all independent campaigns) did not have the developed apparatus that candidates and parties have--the experienced canvassers, the voter lists, the constituency groups--for effective grassroots mobilization efforts. The Perot campaign opted to persuade rather than mobilize, with the consequence that it drew very few people into the process.

The effect of the Perot candidacy on voter turnout was small from another perspective. Although people contacted by the Perot campaign were 5.5 percentage points more likely to vote in 1992, citizens visited by the Democrats and the Republicans were about 9.2 percentage points more likely to turn out.

We suspect that the structural imperatives of an independent bid for the presidency account oncemore for the Perot campaign's lesser ability to turn people out at the polls. First, without the established contacts and protocols that candidates and parties build over the years and refine during the primary season, the Perot organizations were forced more to rely upon "cold calls" and follow-up contacts with people who had earlier reached them through the campaign's toll-free number. The Perot campaign, that is, did not have the same degree of access to established social networks of family, friends and co-workers. Accordingly, its communications may have lacked the intimacy and the implicit social pressure to make good on a favor that make personal contacts most effective. There are disadvantages as well as advantages to being a johnny-come-lately.

Second, lacking the time to develop an extensive set of contacts, the Perot campaign concentrated on the most accessible, the closest at hand, the people everybody else also contacts. For all the talk of the Perot campaign mustering its supporters from the ranks of the disenfranchised, fully 68 percent of the people the Perot forces contacted also were contacted

by one of the two major parties. As shown in Table 4, Perot mobilized the same kinds of people the Democratic and Republican parties mobilized, the well-educated, the affluent, the late-middle-aged, and the socially integrated; all but the partisan. The Perot mobilization, that is, had to settle for having a marginal effect beyond that of the major parties. The Republicans and the Democrats, in a sense, had already gotten there first.

[Table 4 here]

Perot's campaign was largely ineffective in bringing voters out to the polls, and for good reason. Independent campaigns go as much "to the people" as Perot's, rely as much on personal appeal as Perot's, but, like Perot's, they cannot shake the inherent limitations of an independent bid for the White House: the need to persuade a whole lot of people in a very short time with a newly formed campaign organization.

If it is any consolation, though, Perot was as ineffective in raising voter turnout as was his predecessors. Historically, voter turnout has not fluctuated with the ebb and flow of support for third party and independent candidates (Figure 4). No matter how you slice it--regress it, difference it, log it, or otherwise--support for independent candidates is unassociated with the level of voter turnout in presidential elections.[19] As shown in Table 5, even the most successful independent contenders had no evident impact on voter participation.

[Figure 4 and Table 5 here]

---

[19]When we modelled the voter turnout time series as a simple first order autoregressive process with interventions for the advent of woman's suffrage in 1920, the extension of the franchise to 18-to-21 year-olds in 1972, and support for third party candidates, the coefficient for the vote for third party candidates was overwhelmed by its standard error (b = .01; SE(b) = .09). Restricting the analysis to the twentieth century did not change the results (b = -.12; SE(b) = .09). Neither differencing the data nor taking the logarithm of third party vote changed the results. The results did not change when we estimate the effect of prestigious and nationally prestigious third party candidates on turnout. Turnout is not higher when either prestigious third party candidates run (e.g., James Weaver in 1990, William Lemke in 1936, or Lester Maddox in 1976) or when nationally prestigious candidates throw their hats in the ring (e.g., Martin Van Buren in 1948, Theodore Roosevelt in 1912, Robert LaFollette in 1924, or George Wallace in 1968). Finally, the effect of independent candidacies on turnout was no greater when we took into account the proportion of the electorate that had these candidates on their ballots. These variables are defined in Steven J. Rosenstone, Roy L. Behr and Edward H. Lazarus, *Third Parties in America: Citizen Response to Major Party Failure* (Princeton, N.J.: Princeton University Press, 1984).

Table 4

Variables Associated with Being Contacted by a Political Party and by Ross Perot in 1992

Variable	Percentage Contacted by One of the Political Parties	Percentage Contacted by Ross Perot
Education		
Grades 0-8	11.0	.6
Grades 9-12	13.7	1.6
High school diploma	17.1	1.5

Figure 4

Third Party Vote and Turnout, 1844-1992

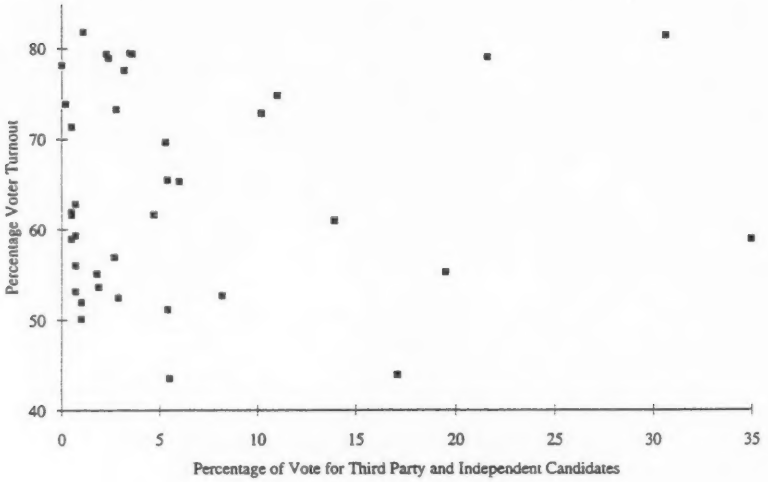

Table 5

Independent Candidacies, Popular Vote, and Voter Turnout, 1912-1992

Year	Independent Candidate	Percentage Popular Vote	Percentage Change in Voter Turnout
1912	Theodore Roosevelt	27.4	-6.6
	Eugene V. Debbs	6.0	
1924	Robert M. LaFollette	16.6	.4
1948	Henry A. Wallace	2.4	-4.9
	J. Strom Thurmond	2.4	
1968	George C. Wallace	13.5	-1.0
1980	John B. Anderson	6.6	-1.0
1992	H. Ross Perot	18.9	5.1

Take, for example, Theodore Roosevelt's 1912 "Bull Moose" campaign--the most successful independent presidential campaign in American history. Like Perot, Roosevelt championed the sovereignty of the American people declaring, "we recognize in neither court, nor Congress, nor President any divine right to override the will of the people." Like Perot, Roosevelt attacked the Democratic and Republican Party as "husks" lacking "real souls . . . divided on artificial lines, boss ridden, and privilege controlled."[20] Like Perot, Roosevelt had charisma and flare for the "dramatic and the spectacular," which made the 1912 contest an unusually spirited race. (During a campaign stop in Milwaukee, Roosevelt was shot at close range, but he went on to deliver his speech, holding up a blood stained handkerchief before the crowd.) In the end, Roosevelt captured 27 percent of the popular vote and 88 electoral votes from 6 states. Voter turnout plunged 6.6 points between 1908 and 1912.

The Perot organization, in sum, helped to increase voter turnout in 1992, but its impact was very, very, very modest and its influence was blandly conventional. Perot himself, however, did not rally new voters by offering hope to the disenchanted. Perot did not rally new voters by the force of his charisma. Perot's mobilization efforts did not achieve the grand effect that Perot might have liked and that many commentators would have us believe.

The Reality of Voter Turnout in the 1992 Election

So far, the anger of the recessed, the alienation of the ignored, and the pied-piping of Perot have come up short of explaining the 5.1 percentage point gain in voter turnout in 1992. In fact, the situation is even worse: we are halfway through the paper and we have not managed to explain much of *any* of the increase in citizen involvement in 1992. Clearly, ad hoc explanations have not succeeded; let us offer a different account.

---

[20]George E. Mowry, *Theodore Roosevelt and the Progressive Movement* (New York: Hill and Wang, 1946), pp. 262-278. Also see Rosenstone, Lazarus and Behr, *Third Parties in America*; George E. Mowry, "The Election of 1912," In Arthur M. Schlesinger and Fred L. Israel (eds), pp. 2135-66, *History of American Presidential Elections, 1780-1968* (New York: McGraw Hill, 1971); and Amos R. E. Pinchot, *History of the Progressive Party, 1912-1916* (New York: New York University Press).

We do not provide a theory of voter turnout in 1992. Such a theory would not be enough really to help us solve the puzzle of 1992--change.[21] Rather, we have sought to understand the general processes that lead some citizens to involvement in politics and others to impassivity, the general processes that pull great numbers into politics at some times and relative handfuls into politics at others. In *Mobilization, Participation, and Democracy in America* we elaborated these processes at length, both theoretically and in empirical application. The conclusions of that work give us the means to understand how particular circumstances in the 1992 election affected voter turnout for better, for worse, or for naught.

To reach this assessment, we began with the estimates reported in *Mobilization, Participation, and Democracy in America*, estimates based upon analysis of the National Election Studies from presidential election years between 1956 and 1988. We then "transformed" the electorate in 1988 into the electorate in 1992. One variable at a time, we gave each of the respondents to the 1988 National Election Study the characteristics of their 1992 counterparts: their more advanced educations, stronger sense of political efficacy, slightly more diffident attachments to political parties, more enthusiastic assessments of the candidates, less frequent exposure to the mobilization efforts of parties, but stepped-up mobilization arising from a more hotly-contested campaign. For each variable, we then computed how much more or less likely members of the 1988 electorate would have been to participate had they been like the members of the 1992 electorate.[22] We also reversed the

---

[21]Gerald H. Kramer, "The Ecological Fallacy Revisited: Aggregate- versus Individual-Level Findings on Economics and Elections and Sociotropic Voting," *American Political Science Review* 77 (March 1983), pp. 92-111.

[22]We use the probit equations reported in Appendix D of Rosenstone and Hansen, *Mobilization, Participation, and Democracy in America* to estimate the magnitude of the effect of each of the political and social changes that occurred between the 1988 and 1992 on the change in electoral participation. In the first step, we used the equations to generate the predicted probability of turnout for each respondent to the 1988 National Election Study. We then altered the scoring of the independent variable of interest to reflect the change in that variable between 1988 and 1992. (For example, to estimate the impact of rising levels of education, we raised each respondent's level of education to reflect the increased level of formal education that prevailed in 1992.) Finally, we calculated the predicted turnout under this simulated condition. The difference between the estimated probability of turnout in 1988 and the simulated probability of turnout under the conditions that prevailed in 1992, averaged across the respondents, yielded an estimate of the marginal effect on participation of that particular change. We repeated this procedure for each variable to calculate its contribution to the change in electoral participation between 1988 and 1992.

exercise. We "transformed" respondents to the 1992 National Election Study into their 1988 counterparts, simulating what turnout would have been in 1992 had each variable assumed the value that prevailed in 1988. The two simulations yielded very similar estimates of the partial effect of each variable on the change in voter participation between 1988 and 1992.[23] The estimates we report below are their averages.

The theoretical understanding that undergirds these estimates situates voter participation in four basic processes, some motivating, some constraining: personal resources, personal stakes, strategic mobilization, and legal context.

The first set of processes is personal. Citizens bear the costs of political participation--the time, the effort, or the money--that they might receive the benefits of political involvement--the products of the policy process, the approbations of other citizens, or the satisfactions of having contributed to a worthy cause. People differ in their resources, in the degree to which they can meet the demands of political involvement. The wealthy, the educated, the experienced, and the efficacious can all more easily afford the charges against their money, time, skill, and self-confidence. Likewise, people differ in their interests and beliefs, in the degree to which they are attracted by the dividends of political life. People who see greater stakes in politics, either because policies affect them more, identities beckon them more, options appeal to them more, or duty calls them more, find more to gain in political action. As resources change, as identities change, as options change, political involvement rises and falls.

The second set of processes is political. Without the intervention of political elites, the public's involvement in the electoral process would quickly be defeated by the collective nature of political life. As attractive as the benefits and as light as the costs might be, citizens face powerful incentives to free ride on the efforts of others. The social nature of political life, however, makes it possible for individuals in concert with political leaders to overcome

[23]The turnout equation estimated on respondents to the 1956-1988 National Election Studies correctly predicts the reported turnout of 79.2 percent of the respondents to the 1992 National Election Study.

those disincentives to take part: Working through social networks of friends, family, co-workers, and associates, politicians, parties, campaigns, and interest groups supply information and occasion the creation of the particularized social benefits that surmount the free rider problem. Locked in struggles to win elections, politicians mobilize public involvement strategically. They calibrate their efforts to necessity, working harder the closer the contest. As competition intensifies and diminishes, mobilization--and with it participation--rises and falls.

Finally, political participation and political mobilization take place within a framework of electoral institutions that allocate participatory burdens and rewards. The requirements of local, state, and federal election laws impose additional costs on participation and on mobilization. They force people to come up with even more resources to participate; they force political activists to come up with even more resources to offset the increased burdens on those they would mobilize. As barriers rise and fall, mobilization and participation fall and rise.

As Table 6 shows, many of the attributes of the electorate and many of the characteristics of the election environment changed between 1988 and 1992; some changed markedly. The electorate acquired more education, gained efficacy, and aged, but it also found itself in more difficult employment circumstances. Its partisanship continued slightly to weaken, though its affection for the major parties remained unchanged. Its feelings for the candidates deepened and its concern over the outcome intensified. Continuing a trend, the number of people contacted directly by the political parties declined. Still, the 1992 race was much tighter, and the efforts by the campaigns, by interest groups, and by activists to mobilize were much more acute. The impediments to voter registration abated, if only partially.

[Table 6 here]

The next four sections examine each of these changed circumstances, gauging the contribution of each to the largest increase in voter turnout since 1952. Some helped to

Table 6

Characteristics of the Electorate and the Electoral Setting, 1988 and 1992
(Percentages, Unless Otherwise Noted)

Resources	1988	1992	Change
Education: 1-3 years of college	22.5	23.6	1.1
College degree	19.8	23.5	3.7
Unemployed	7.8	10.3	2.5
Age: < 25	9.9	8.9	-1.0
45-64	24.6	26.2	1.6
> 65	17.9	19.4	1.5
Internal efficacy: Politics too complicated (disagree)	23.3	27.2	3.9
External efficacy: Public officials don't care (disagree)	42.5	37.7	-4.8
No say in what govt (disagree)	54.5	57.5	3.0
Evaluation of Parties and Candidates			
Strength of partisanship: Strong partisans	31.2	29.0	-2.2
Pure independents & apoliticals	12.2	12.8	.6
Affect for a party (on a 1-10 scale)	2.0	2.0	0
Care which party wins presidential election	61.0	75.7	14.7
Affect for presidential candidate (on a 1-10 scale)	2.8	3.4	.6
Social Involvement			
Years in community (logarithm)	3.0	2.9	- .1
Regular church attendance	36.4	37.5	.9
Homeowners	63.4	65.6	2.2
Currently employed	63.5	61.9	-1.6
Mobilization by Parties			
Contacted by a party	23.6	20.1	-3.5
Mobilization by Campaigns			
Closeness of last Gallup poll	12.0	7.0	-5.0
Perceived election as close race	69.7	79.1	9.4
Gubernatorial election in state	12.1	12.0	- .1
Competitive presidential primary election in state	82.8	83.7	.9
Legal Organization of Elections			
Voter registration closing date (days before election)	26.2	25.3	- .9
Other Demographic Variables			
Live in a southern state	31.6	31.4	- .2
Live in a border state	5.1	5.4	.3
Blacks	13.2	13.0	- .2
Mexican-Americans and Puerto Ricans	5.4	5.2	- .2

expand voter turnout; some kept it below what it might have been. All told, however, they together account for 4.1 of the 5.1 percentage point increase--a touch more than 80 percent (Table 7).

[Table 7 here]

1. Increased Resources

On balance, the electorate's resources increased in 1992. Just as it has for five decades, its educational attainment improved. The fraction of the population that had at least attended college grew by nearly 5 percentage points since the last presidential election. The electorate also aged. The proportion of the population comprised of the youngest citizens--those under the age of 25--fell by a point, and the proportion comprised by the late middle aged continued to rise. Finally, the electorate's efficacy grew, particularly its internal efficacy. The proportion of the electorate who rejected the claim that public officials "don't care much what people think" fell slightly, and the proportion who rejected the notion that "people like me don't have any say in what the government does" rose only a tad between 1988 and 1992 as did the number who resisted the idea that "politics and government seem so complicated that a person like me can't really understand what's going on."

In 1992, that is, greater numbers of people were able to bear the costs of political participation. Better educated, the electorate had more information, more ability to assimilate and use new information, and more skills with which to negotiate the maze of requirements--from registration to making a choice to casting a ballot--that even the simple act of voting entails. Better educated, it was better placed in social networks that convey information about politics, social networks that expect and reward political involvement. Older and presumably wiser, the electorate had more experience in politics, more integration into the political community, and more familiarity with the political process. More efficacious, finally, the electorate had greater psychological resources, greater confidence in its ability to affect the political system.

Decomposition of the Increase in Voter Turnout Between the 1988 and 1992 Presidential Elections

The Change	Effect (in Percentage Points) on Change in Turnout Between 1988 and 1992	Percentage of Increase In Turnout Explained
Resources		53
Increased formal education	+ .7	
Increased unemployment	- .1	
An older electorate	+ .7	
Increased feelings of efficacy	+1.0	
Evaluation of Parties and Candidates		30
Weakened attachment to and evaluation of the political parties	- .3	
Greater concern over which party wins the presidential election	+1.2	
Stronger evaluation of a major party presidential candidate	+ .4	
Mobilization		15
Less contact by a political party	- .4	
A closer election	+1.0	
Legal Organization of Elections		2
Shorter closing date	+ .1	—
Net change in voter turnout:	+4.1*	100

* Note: Because of nonlinearity in the probit model, the total net change does not necessarily equal the sum of the changes in each of the components of that change.

those disincentives to take part: Working through social networks of friends, family, co-workers, and associates, politicians, parties, campaigns, and interest groups supply information and occasion the creation of the particularized social benefits that surmount the free rider problem. Locked in struggles to win elections, politicians mobilize public involvement strategically. They calibrate their efforts to necessity, working harder the closer the contest. As competition intensifies and diminishes, mobilization--and with it participation--rises and falls.

Finally, political participation and political mobilization take place within a framework of electoral institutions that allocate participatory burdens and rewards. The requirements of local, state, and federal election laws impose additional costs on participation and on mobilization. They force people to come up with even more resources to participate; they force political activists to come up with even more resources to offset the increased burdens on those they would mobilize. As barriers rise and fall, mobilization and participation fall and rise.

As Table 6 shows, many of the attributes of the electorate and many of the characteristics of the election environment changed between 1988 and 1992; some changed markedly. The electorate acquired more education, gained efficacy, and aged, but it also found itself in more difficult employment circumstances. Its partisanship continued slightly to weaken, though its affection for the major parties remained unchanged. Its feelings for the candidates deepened and its concern over the outcome intensified. Continuing a trend, the number of people contacted directly by the political parties declined. Still, the 1992 race was much tighter, and the efforts by the campaigns, by interest groups, and by activists to mobilize were much more acute. The impediments to voter registration abated, if only partially.

[Table 6 here]

The next four sections examine each of these changed circumstances, gauging the contribution of each to the largest increase in voter turnout since 1952. Some helped to

Shorter closing date	+ .1	—
Net change in voter turnout:	+4.1*	100

* Note: Because of nonlinearity in the probit model, the total net change does not necessarily equal the sum of the changes in each of the components of that change.

These more ample resources explain about half of the increase in voter turnout all by themselves. Gains in education and gains in age and experience both contributed .7 of a point to the 5.1 percentage point rise. Gains in efficacy, particularly in internal efficacy, the sense of personal competence to understand and participate in politics, contributed 1 percentage point.

Voter turnout might have increased still more, however, had the economy been as strong in 1992 as it was in 1988. Nearly 3 percent more of the electorate reported being unemployed in 1992; 3 percent more of the electorate faced substantial opportunity costs of political involvement. Economically pressed, the unemployed have better things to do with their time--chiefly, finding a new job--than to register and vote. Wrenched from their workplaces, the unemployed are no longer exposed to the daily interactions with employers, unions, colleagues, and friends, to the subtle social pressures and expectations that help to motivate political involvement. Economic adversity does not make people angry and eager to participate; economic adversity makes people anxious, alone and preoccupied. In 1992, the electorate's greater experience with joblessness pulled voter turnout .1 percentage points below what it could have been.

The argument generalizes. These same factors, better education and heightened efficacy, account for about a quarter of the 8.7 point increase between 1988 and 1992 in attempts to influence the choices of other voters. (See Table 8.) The electorate's more ample resources permitted greater political activism.

[Table 8 here]

2. Better Choices

Citizens perceived greater benefit from their involvement in the 1992 election than they did in 1988.

Table 8

Decomposition of the Increase in Trying to Persuade Others How to Vote Between the 1988 and 1992 Presidential Elections

The Change	Effect (in Percentage Points) on Change in Turnout Between 1988 and 1992	Percentage of Increase In Turnout Explained
Resources		26
Increased formal education	+ .9	
An older electorate	- .5	
Increased feelings of efficacy	+1.8	
Evaluation of Parties and Candidates		59
Weakened attachment to and evaluation of the political parties	- .4	
Greater concern over which party wins the presidential election	+3.1	
Stronger evaluation of a major party presidential candidate	+2.4	
Mobilization		15
Less contact by a political party	-1.8	
A closer election	+3.1	___
Net change in persuading others:	+8.6*	100

* Note: Because of nonlinearity in the probit model, the total net change does not necessarily equal the sum of the changes in each of the components of that change.

Despite "straight Texas talk" about the inadequacies of the two major parties, the electorate's affection for the Democrats and the Republicans did not diminish at all between 1988 and 1992, though its identification with the major parties weakened a little. The proportion that claimed strong attachment to one of the major parties was about 2.2 percentage points lower than it was in 1988, but the proportion that claimed to be either apolitical or independent with no partisan leanings grew but .6 of a point.

Likewise, despite the usual post-primary kvetching about the deficiencies of the nominees--they were not Lincoln and Roosevelt, after all--the intensity with which the electorate cleaved to its favorites actually increased. Americans were more enthusiastic about the major party options in 1992 than they had been about the alternatives in 1988. More so than Bush and Dukakis in 1988, Bush and Clinton offered more choice than echo, and citizens noticed the difference, professing greater devotion for their favorites.

Finally, despite the prevailing portrait of popular apathy and despair, the electorate in fact cared deeply about which party would win the 1992 election. Indeed, the number of Americans who expressed a significant measure of concern over the outcome was the highest in the 40 years that the National Election Studies have been asking the question. Seventy-six percent said that it meant a good deal to them which party won.[24]

All told, the public's more acute sense of the benefits of political involvement lifted voter turnout in 1992 by 1.3 percentage points. To be sure, its weaker attachments to the political parties caused voter participation to be lower than it might have been--.3 percentage points lower. But the depressing effect of looser identification with the parties was more than

---

[24]Thirty-nine percent of the respondents to the 1992 National Election Study, a number equal to the greatest number recorded back into the sixties, reported a great deal of interest in the 1992 campaign. The Gallup Organization found a similar increase in interest in the campaign: 83 percent of the 1992 electorate reported in October that they had given a lot of thought to the upcoming election for president, the highest level of interest recorded since Gallup began asking this question in 1968. American Political Network, Inc., "Turnout: The Indicators Say This One Will be Different," *The Hotline*, 28 October 1992. Voters followed their interest up with action. The audience for the three presidential debates averaged 66.4 million people, almost 25 percent more than four years earlier. Viewership of the 1992 vice-presidential debate was 9.2 percent higher than in 1988. The voting age population grew only 3.5 percent during that same period. Nielsen Media Research, quoted in *ibid.*

overcome by the stimulating effects of greater enthusiasm for the options--.6 percentage points--and, especially, greater concern over the outcome--1.2 percentage points.

The same was true for other forms of involvement in the 1992 election. While weaker attachments to parties sapped the electorate's enthusiasm for attempts to influence others, greater affect for the candidates and greater concern over the outcome encouraged people to try to convert others, explaining 5.1 of the 8.7 percentage point rise in persuasion all by themselves.

In 1992, in sum, citizens perceived more to win and more to lose in the election. They identified more closely with the alternatives and expected greater gains and gratifications from the triumph of the "right" side. With a better sense of the value of one candidate beating the other, there was greater incentive for citizens to take part. Given a choice, the people responded.

3. More Extensive Mobilization
